A STREETCAR NAMED DESIRED FUTURE CONDITIONS: THE NEW GROUNDWATER AVAILABILITY FOR TEXAS

I. INTRODUCTION

Perhaps you didn’t notice it, but the ground—or, more accurately, the groundwater policy—shifted beneath your feet on September 1, 2005. On this date, House Bill 1763, passed by the 79th Legislature, became effective. House Bill 1763, as it is reflected in Chapter 36 of the Texas Water Code, presents profound changes in how groundwater availability is determined in Texas, and groundwater availability—the amount of groundwater available for use—affects where many Texans will be getting their water in the future. Because the population of Texas is expected to double over the next 50 years, groundwater availability—wrapped as it is with groundwater management—will continue to be a topic of heated debate.

In its more important changes, House Bill 1763 (1) regionalizes decisions on groundwater availability, (2) requires regional water planning groups to use groundwater availability numbers from the groundwater conservation districts, and (3) defines a permitting target/cap for groundwater production. These changes affect the rules and plans of groundwater conservation districts, various groundwater supply projects planned around the state, and the regional and state water plans. It also affects the ability of political subdivisions to get state loans for groundwater projects, even if those projects are in areas with no groundwater conservation districts. The purpose of this paper is to note the most important changes and how they relate to groundwater policy and water planning. In addition, we describe the role of the Texas Water Development Board (TWDB) in the groundwater management area process.

II. GROUNDWATER MANAGEMENT AREAS: FROM NOTHING TO NOW

A groundwater management area is defined as an area suitable for the management of groundwater resources. Although groundwater management areas have recently become important in groundwater management, they have been around more than 50 years. Up until September 2001, the primary purpose of groundwater management areas was the creation of groundwater conservation districts by petition. After September 2001, the primary purpose of groundwater management areas has been joint planning—planning that became required in September 2005.

In 1949, the Legislature authorized a petition process for designating “underground water reservoirs,” the predecessor to groundwater management areas, by the Texas Board of Water Engineers and for creating groundwater conservation districts. To create a groundwater conservation district back then, an underground water reservoir needed to first be delineated. In 1955, the Legislature allowed the Texas Board of Water Engineers to designate underground water reservoirs on its own without an external petition. In 1985, the Legislature changed “underground water reservoirs” to “management areas” and required that the boundaries of a groundwater conservation district be coterminal with a management area, although political boundaries could be considered. The Legislature changed the name again in 1989 from “management areas” to “underground water management areas” and removed the requirement for delineating a management area for legislatively created groundwater conservation districts. Underground water management areas became “groundwater management areas” in 1995.

The Legislative history in this and the next paragraph is from TNRCC and TWDB (2001). Appendix A has a summary of legislation related to groundwater management areas, and Appendix B is a quick reference to important parts of statute and administrative rules concerning groundwater management areas.

By 2001, seven of the districts were created by petition. Most (77) were created through legislation.

The Texas Board of Water Engineers is a predecessor agency to the Texas Water Development Board and the Texas Commission on Environmental Quality.

Groundwater conservation districts were referred to as underground water conservation districts at the time (and up to 1995).

Coterminal, a variant of conterminous, means “contained in the same boundaries; coextensive” (Soukhanov, 1992).

The Legislature also introduced the concept of a “critical area process” in 1985, later renamed as the priority groundwater management area process. Priority groundwater management areas are areas delineated by the Texas Commission on Environmental Quality that are experiencing or are expected to experience critical groundwater problems in the next 25 years. The ultimate purpose of priority groundwater management areas is the creation of groundwater conservation districts, either through local initiative or by the Commission. To date, the commission has created five priority groundwater management areas (TCEQ and TWDB, 2007). Two additional priority groundwater management areas may be designated in 2008/2009 (Kelly, 2007; Byrd, 2007).
In 2001, as part of Senate Bill 2, the Legislature moved the responsibility of creating groundwater management areas to the TWDB and directed the TWDB to delineate groundwater management areas that covered all of the major and minor aquifers of the state. The statute directed the TWDB to use aquifer boundaries or subdivisions of aquifer boundaries for the groundwater management area boundaries, although other factors, including political boundaries, could be considered. After a stakeholder meeting to discuss different ways to place the boundaries, eight public meetings around the state, and a formal public hearing in Austin, the TWDB adopted boundaries for groundwater management areas that covered the entire state in November 2002 (see Figure 1 in Mace other others, 2006, for the original designation). TWDB staff used aquifers and other hydrologic boundaries to guide the delineation of groundwater management areas. The boundaries primarily honored the boundaries of the major aquifers of Texas as identified in various TWDB publications. In areas with multiple major aquifers, TWDB generally placed a preference on the shallowest aquifer. The TWDB divided several of the major aquifers into multiple groundwater management areas. These divisions were based on hydrogeology and current water-use patterns and coincided with natural features where possible. Where possible, the TWDB aligned boundaries with county and existing groundwater conservation district boundaries.

The TWDB may revise the boundaries as appropriate. Since 2002 there have been two such revisions, one to place all of Walker County into Groundwater Management Area 14 (a northern sliver of the county had been located in Groundwater Management Area 11) and one to move the line located in Groundwater Management Area 11) and one to move the line between groundwater management areas 15 and 16 farther to the southwest (Figure 1). TWDB’s administrative process for changing groundwater management area boundaries requires that the change be hydrologically consistent with the aquifer(s) and that every district in the affected groundwater management areas agrees with the change. At this point, TWDB staff review the request and submit it to the TWDB for consideration. Groundwater management area boundaries are part of the TWDB’s rules, so a change in a boundary requires a rule amendment.

Senate Bill 2 (2001) also required that groundwater conservation districts share their groundwater management plans with each other within a groundwater management area and participate in joint planning, but only if a district in the management area called for it. However, in 2005, the Legislature—via House Bill 1763—required joint planning among groundwater conservation districts within groundwater management areas. The presiding officers, or their designees, of groundwater conservation districts are required to meet at least annually to conduct joint planning and to review groundwater management plans and accomplishments in the groundwater management area. A key part of joint planning is determining “desired future conditions,” conditions that are used to calculate “managed available groundwater” values. These conditions and numbers are used for regional water plans, groundwater management plans, and permitting.

III. MAJOR CHANGES DUE TO HOUSE BILL 1763

House Bill 1763 of the 79th session produced several major changes related to groundwater policy. These major changes include (1) regionalizing decisions on groundwater availability, (2) requiring regional water planning groups to use groundwater availability numbers developed from the groundwater management area process, and (3) requiring a target/cap for groundwater permitting.

A. Regionalized Decisions on Groundwater Availability

Before House Bill 1763, each groundwater conservation district defined their own groundwater availability which was included in their groundwater management plans under the name “total usable amount of groundwater.” With the passage of House

10 By 2001, the Texas Commission on Environmental Quality and its predecessors had designated 19 groundwater reservoirs and groundwater management areas. A map of these delineations is available in TNRCC and TWDB (2001, p. 41). These boundaries were dissolved when the TWDB adopted groundwater management areas that covered the entire state.

11 TWDB held public meetings concerning the proposed rule on groundwater management area boundaries in several locations throughout the state in September 2002, including the cities of Alpine, Corpus Christi, Fredericksburg, Plainview, San Angelo, Stephenville, Tyler, and Wharton. The Board also held a public hearing in Austin on September 30, 2002.

12 The latest boundaries are referred to in 31TAC§356(B).

13 To our knowledge, a groundwater conservation district had never officially called for joint planning. However, there are several alliances of districts across the state that allowed districts to compare plans and rules.

14 With the exceptions of (1) the Edwards Aquifer Authority, which has its groundwater availability defined in statute; (2) the subsidence districts, which have their desired future conditions defined in statute; and (3) cases of conflict with the regional water plan, discussed in the next section.

15 However, some districts interpreted this literally as the total volume of groundwater that could be used if it could be pumped. In other words, the aquifer could be completely drained.
Bill 1763, districts are now required to work together in each groundwater management area to develop “desired future conditions” for their groundwater resources (discussed in more detail later). The districts then deliver these desired future conditions to the TWDB. The TWDB, in turn, provides estimates of “managed available groundwater”—the new term in statute for groundwater availability—to the districts for inclusion in their groundwater management plans and to the regional water planning groups for inclusion in their regional water plans.

B. Regions Have to Use Groundwater Management Area Numbers

Before House Bill 1763, regional water planning groups only had to consider the information in groundwater management plans. Therefore, if a planning group wanted to use a groundwater availability number different from that provided by a groundwater conservation district, they could. In addition, groundwater availability numbers in groundwater management plans needed to “...address water supply needs in a manner that [was] not in conflict with the appropriate approved regional water plan...” In other words, if a region had identified a need for a certain amount of groundwater, the groundwater conservation district had to choose a groundwater availability value that accommodated that need. With the passage of House Bill 1763, regional water planning groups are now required to use managed available groundwater for their groundwater availability estimates. Because managed available groundwater is defined by the desired future conditions, groundwater conservation districts, working collectively within each groundwater management area, define groundwater availability for the regional water planning process.

This “switch” in who decides groundwater availability for regional water planning will have implications for future regional and state water planning. In its 2006 regional water plan, the South Central Texas Regional Water Planning Group notes that: “Given these new requirements for determining desired future conditions for the relevant aquifers, and that individual groundwater conservation district’s groundwater management plans shall be consistent with achieving the desired future conditions of the relevant aquifers, the quantity of groundwater available for use by water users located within the respective parts of water planning regions is uncertain, and quite likely will change from the quantities now being used in regional planning. Therefore, water planning for water user groups whose future supplies are from groundwater should carefully consider broadening their strategies both in terms of quantities and sources to take this uncertainty into account.” This statement applies to many of the other regional water planning areas as well.

C. A Target for Groundwater Production

Before House Bill 1763, it was arguable whether or not groundwater conservation districts—outside of the Edwards Aquifer Authority and the subsidence districts—had the ability to place a cap on groundwater production. With the passage of House Bill 1763, statute now states that “[a] district, to the extent possible, shall issue permits up to the point that the total volume of groundwater permitted equals the managed available groundwater...” Before this time, the majority of districts did not have an overall cap on groundwater production.19

IV. DESIRED FUTURE CONDITIONS → MANAGED AVAILABLE GROUNDWATER → PLANS

Desired future conditions are the desired, quantified conditions of groundwater resources (such as water levels, water quality, spring flows, or volumes) at a specified time or times in the future or in perpetuity. In essence, a desired future condition is a management goal that captures the philosophy and policies addressing how an aquifer will be managed. What do you want your aquifer to look like in the future? Some examples of desired future conditions include, but are not limited to: (1) water levels do not decline more than 100 feet in 50 years, (2) water quality is not degraded below 1,000 milligrams per liter of total dissolved solids for 50 years, (3) spring flow is not allowed to fall below 10 cubic feet per second in times during the drought of record for perpetuity, and (4) 50 percent of the water in storage will be available in 50 years.21

Groundwater conservation districts are now required to conduct joint planning within groundwater management areas. The primary goal of joint planning is to define the desired future conditions of their groundwater resources. Districts are required to consider groundwater availability models and other

18 TWC§36.1132
19 However, many districts have correlative pumping limits such as a certain amount of pumping per acre of land.
20 After 31TAC§356.2(8)
21 Note that we have used 50 years or longer in our examples. Since desired future conditions will be used to calculate groundwater availability that will ultimately go into the regional water plans, desired future conditions should ideally be at least 50 years, the planning horizon for regional water planning. TWDB rules now require that the desired future condition be defined over the current planning period for regional water planning (TAC§356.2(8)).
data or information for the groundwater management area and uses or conditions of an aquifer within the groundwater management area that differ substantially from one geographic area to another.\textsuperscript{22} Districts can consider establishing different desired future conditions for each aquifer, subdivision of an aquifer or geologic strata, and each geographic area overlying an aquifer within a groundwater management area.\textsuperscript{23} A subdivision of an aquifer could include “sub-aquifers” such as the Chicot, Evangeline, and Jasper aquifers of the Gulf Coast Aquifer or different segments of an aquifer such as the San Antonio, Barton Springs, and northern segments of the Edwards (Balcones Fault Zone) Aquifer. Geologic strata often coincide with aquifers and sub-aquifers. The meaning of “geographic area” is not clear and could include a number of surficial factors.\textsuperscript{24} The desired future conditions statements must be adopted by a two-thirds vote of at least two thirds of the districts located in whole or in part in the groundwater management area.\textsuperscript{25}

We recommend that districts in groundwater management areas actively seek the involvement of stakeholders in the joint planning process. This way, districts can consider all perspectives before deciding on desired future conditions. Because of the various and often conflicting viewpoints concerning groundwater management, establishing desired future conditions can be difficult. One way of more formally involving stakeholders is to use the approach being used by Groundwater Management Area 9 in cooperation with the Lyndon B. Johnson School of Public Affairs (Eaton and others, 2008). This approach involved identifying stakeholder preferences through videotaped interviews with stakeholders, developing and using a simplified user-interface for the groundwater availability model for the area, and sharing results through various stakeholder meetings.

We also recommend that districts not submit desired future conditions to the TWDB without first knowing what the answer—the managed available groundwater—will be. The reason for this is to ensure that whatever the managed available groundwater is, that districts understand how that value relates to current and projected groundwater use and to any proposed groundwater supply projects.

The TWDB has included the submission requirements for a desired future condition in its rules\textsuperscript{26} which require (1) physically compatible conditions; (2) copies of the groundwater management area meeting postings and minutes, with the complete voting record by member, of the groundwater management area's public meetings at which the desired future conditions were adopted; (3) a resolution signed by the groundwater management area member district representatives adopting the desired future conditions; (4) the name of a designated representative of the groundwater management area for TWDB staff to contact as necessary; and (5) any other information the Executive Administrator of the TWDB or designee may require. An informational sheet on how to submit desired future conditions is available from the TWDB.\textsuperscript{27}

In its rules, the TWDB requires that desired future conditions have to be physically possible, individually and collectively, if different desired future conditions are stated for different geographic areas overlying an aquifer or subdivision of an aquifer within the groundwater management area.\textsuperscript{28} First, the desired future conditions have to be physically possible. For example, a desired future condition limiting water-level declines to 100 feet in an unconfined (water table) aquifer with only 50 feet of water would be physically impossible. Second, if there are multiple desired future conditions in the same aquifer in a groundwater management area, they need to be compatible. For example, it would be difficult to estimate managed available groundwater if one geographic area with a desired future condition of maintaining spring flow was right next to another geographic area with a desired future condition to drain the aquifer. This TWDB requirement, however, does not apply across groundwater management areas in the same aquifer.\textsuperscript{29}

After the groundwater conservation districts have developed their plans, they are required to submit their desired future conditions statements to the Executive Administrator of the TWDB.\textsuperscript{30} The TWDB then provides each district and regional water planning group in the groundwater management area with the values of managed available groundwater based on the desired future conditions.

Districts are required to report the managed available groundwater in their groundwater management plans and to ensure that their groundwater

\textsuperscript{22} TWC\$36.108(d)
\textsuperscript{23} TWC\$\$36.1089(d)(1)–(2)
\textsuperscript{24} Soukhanov (1992) defines “geographic” as (1) of or relating to geography or (2) concerning the topography of a region. The relevant definition for “geography” is: the physical characteristics, especially the surface features, of an area.
\textsuperscript{25} TWC\$36.108(d-1). There is also a requirement that all districts provide public notice of the meeting.
\textsuperscript{26} TAC\$356.34
\textsuperscript{27} http://www.twdb.state.tx.us/GwRD/pdfs/docs/HSDFC.pdf
\textsuperscript{28} 31TAC\$356.2(8)
\textsuperscript{29} However, there is a process where a district next to a groundwater management area can petition that the area’s desired future condition is not reasonable (addressed in the next section).
\textsuperscript{30} TWC\$36.108(o)
management plans contain goals and objectives consistent with achieving the desired future conditions. Districts are also required to permit, to the extent possible, up to the managed available groundwater value. Regional water planning groups are required to use the managed available groundwater values in their regional water plans.

Once desired future conditions are adopted, there are other requirements of the joint planning. Districts will need to evaluate, among other requirements, the degree to which each groundwater management plan achieves the desired future condition.

V. CHALLENGING DESIRED FUTURE CONDITIONS

There are several ways for someone to protest the desired future conditions or the implementation of the desired future conditions, one through the TWDB and one through the Texas Commission on Environmental Quality.

A person with a legally defined interest in groundwater in the management area, a district in or adjacent to the groundwater management area, or a regional water planning group in the groundwater management area may file a petition with the TWDB appealing the approval of desired future conditions. TWDB rules define a “person with a legally defined interest” as a person “…who owns land or groundwater rights in the district, has a legal interest in a well in the district, has authorization from the district to produce groundwater, or otherwise has an interest in groundwater in the district as granted by court order or judgment.”

The petition has to include evidence that the districts did not establish a reasonable desired future condition. The process is as follows:

- A person with a legally defined interest files a petition with the TWDB appealing the approval of the desired future condition, including evidence that the groundwater conservation districts did not establish a reasonable desired future condition. The petitioner is required to send the petition to the groundwater conservation districts in the groundwater management area at least 30 days before he or she submits the petition to the TWDB.
- TWDB staff determines if the petition is reviewable. If the petition is not reviewable, the Executive Administrator of the TWDB may dismiss the petition.
- Groundwater conservation districts in the groundwater management area have 10 days to request 60 days to try and resolve the petition.
- The Executive Administrator of the TWDB, or his designee, holds at least one public hearing at a central location in the groundwater management area.
- TWDB staff reviews the petition, testimony, and any relevant evidence and provides a summary analysis, which may include a recommendation, to the TWDB. The summary analysis may include information on groundwater use, socio-economic impacts, environmental impacts, impacts on private property rights, reasonable and prudent development of the state’s groundwater resources, state policy, legislative directives, and any other information relevant to the specific condition, including whether or not the desired future condition is reasonably possible.
- The TWDB reviews the summary analysis and decides whether or not the desired future condition is reasonable. The TWDB may table the decision for further consideration at another meeting.
- If the TWDB decides that the desired future condition is reasonable, the TWDB issues written findings to the petitioner and the groundwater conservation districts and the petition process ends.
- If the TWDB decides that the desired future condition is not reasonable, the TWDB issues written findings to the petitioner and the groundwater conservation districts which include recommended changes to the desired future condition.
- The groundwater conservation districts revise their desired future condition in accordance with the TWDB’s findings and recommendations.
- The groundwater conservation districts submit the revised desired future condition to the TWDB and may request TWDB opinion regarding whether the revisions are in accordance with TWDB’s recommendations.

---

31 TWC§36108(d-2)
32 TWC§36.1132
33 TWC§16.053(e)(3)(A)
34 TWC§ 36.108(c)(4)
35 31TAC§356.2(17) of the TWDB’s rules, updated in January 2008, states that a person with a legally defined interest in groundwater is a person who owns land or groundwater rights in the district, has a legal interest in a well in the district, has authorization from the district to produce groundwater, or otherwise has an interest in groundwater in the district as granted by court order or judgment.
36 TWC§36.108(l)
37 TAC§356.2(17)
38 TWC§§36.10(m)–(o), TAC§§356.41–356.46
● The groundwater conservation districts hold at least one public hearing at a central location in the groundwater management area to seek public comment on TWDB’s recommended revisions.

● The groundwater conservation districts revise the desired future condition after considering public comments and the TWDB's findings and recommendations.

● The groundwater conservation districts submit the revised desired future condition to the TWDB for review. If the districts changed the desired future condition from TWDB's recommendations, then the districts have to provide a rationale, based on comments received at their public hearing, for the changes.

● TWDB will provide public notice of the district's revisions and may provide a response to the revisions.

● If the groundwater conservation districts have followed TWDB’s TWDB provides managed available groundwater values to the groundwater conservation districts and the regional water planning groups.

It is possible, after going through this lengthy process, to wind up with the same desired future condition that existed at the beginning of the process. This is because the districts have the final say on what the final desired future condition is. At a minimum, the process gives the public the opportunity an official vetting of issues independent of the groundwater management area process.

A district or person with a legally defined interest in the groundwater in the groundwater management area may also file a petition with the Texas Commission on Environmental Quality alleging that a district has not adopted rules that are designed to achieve the desired future conditions or that a district is not enforcing compliance with their district rules.39 Once the petition is filed, the following occurs:40

- the Commission reviews the petition within 90 days and either (1) dismisses the petition if the evidence does not support the allegations or (2) selects a review panel;
- the commission assembles a review panel that consists of a chairman, four other members, and a non-voting member to serve as a recording secretary;
- within 120 days of appointment, the review panel will review the petition and any evidence relevant to the petition and, in a public meeting, consider and adopt a report to the commission with recommended action (The commission may direct the review panel to hold public hearings in the groundwater management area. The review panel may attempt to negotiate a settlement or resolve the dispute.); and
- the Commission will then take action on the report within 45 days.

If the rules adopted by the district are not designed to achieve the desired future conditions, the Commission may issue an order. This order could (1) require the district to take or not take certain actions, (2) dissolve the district’s board and call for the election of a new board, (3) place the district in receivership, (4) dissolve the district, or (5) give recommendations to the legislature on how to achieve comprehensive management in the district.

Before the passage of House Bill 1763, there were opportunities for conflict between groundwater availability in a groundwater management plan and a regional water plan. The passage of House Bill 1763 removed this language from statute and addressed the issue of inconsistent plans since the groundwater management area process will result in consistent groundwater availability numbers between groundwater management plans and regional water plans. However, there is still a chance for conflict if a region decides to distribute the managed available groundwater different than the districts do. House Bill 1763 put into place a process by which a conflict is resolved between a groundwater conservation district and a regional water planning group.41 In this process:

- a person with a legally defined interest in a groundwater conservation district or the regional water planning group files a petition with the TWDB that a conflict requiring resolution may exist between the district’s approved groundwater management plan and the state water plan;
- if a conflict exists, the TWDB provides technical assistance and facilitates coordination between the petitioner and the district to resolve the conflict;
- if the conflict is not resolved, the petitioner and district may seek mediation;
- if the conflict cannot be resolved through mediation, the TWDB resolves the conflict, which can include required changes to the groundwater management plan and/or the regional and state water plans, no later than 60 days after the end of mediation efforts; and
- if the district disagrees with TWDB’s resolution, the district may appeal the

40 TWC§36.108(g), (h), (i), (j), and (k)
41 TWC§36.1072(g)
VI. PLANNING FOR THE “WHITE AREAS”

The TWDB’s groundwater conservation district map is a colorful patchwork in which each of the 95 groundwater conservation districts is assigned a different color (Figure 2). Groundwater management areas without districts are without color, what we refer to around the office as the “white areas.” An interesting provision of House Bill 1763 is that groundwater conservation districts are not only deciding desired future conditions for the aquifers in their districts, but also for the aquifers outside of their districts. For some groundwater management areas—such as areas 10 and 12—this should not be much of a challenge because most of the areas have groundwater conservation districts. For other groundwater management areas—such as areas 3 and 8—this could be more of a challenge because most of the areas do not have groundwater conservation districts.42

The desired future conditions that groundwater conservation districts develop for the groundwater management areas will also be used to develop managed available groundwater values for the “white areas.” These values will be used by the regional water planning groups and could affect state funding for water projects outside of the districts, even though the rule of capture applies. The reason for this is because the regions are required to use the numbers from the districts. Therefore, although the lack of groundwater conservation districts means there are effectively no limits on pumping, there is a limit for water planning purposes. If a project is not in the regional water plan, then the project cannot receive state funding. However, if a municipality can find alternative funding, they can still build the project, regardless of what the groundwater conservation districts and regional water planning groups say (This only applies to the white areas: a municipality within a district will need to abide by the district’s rules).

In addition, any new districts will be created under the existing desired future conditions statements and managed available groundwater values, at least until the next time desired future conditions are reconsidered. A low managed available groundwater value for an area, especially one below current use, could hurt the formation of a district in the area.

Because of the importance of the desired future conditions in the “white areas,” districts should strongly consider involving stakeholders in these areas as part of the process. Districts in several groundwater management areas have already addressed this. Groundwater Management Area 13 has invited county judges in those counties without districts to participate as non-voting members. Groundwater Management Area 14 is including the subsidence districts43 in the joint planning process. Groundwater management areas 3, 8, and 16 have also worked to include other stakeholders. Additional stakeholder involvement up front may minimize petitions against the desired future conditions later.

The legislature, recognizing the importance of including other stakeholders in the process, amended the water code in 2007 to state that “[i]t is the policy of the state to encourage public participation in the groundwater management process in areas within a groundwater management area not represented by a groundwater conservation district.”44

VII. TIMING IS EVERYTHING

Statute requires that groundwater conservation districts in groundwater management areas submit their desired future conditions to the TWDB by September 1, 2010. However, for managed available groundwater values to be used in the next round of regional and state water planning (2007–2012), desired future conditions statements will need to be submitted much earlier, probably before the summer of 2008.45 Time is needed for TWDB staff to estimate managed available groundwater values and for regional water planning groups to incorporate the new managed available groundwater values into their planning documents.46 At some point during the regional water planning process, if managed available groundwater values are not available, regional water planning groups have to use their own numbers to meet their statutory deadlines.

The TWDB amended its rules such that if the districts in a groundwater management area submitted desired future conditions before January 1, 2008, regional water planning groups would be required to use the managed available groundwater values in their plan.47 The groundwater conservation districts in Groundwater Management Area 8 were the only ones to submit desired future conditions (for some of its aquifers) by that deadline. After January 1, 2008, the decision to include managed available groundwater

42 In the case of Area 5, there are no groundwater conservation districts.

43 The Legislature removed the subsidence districts from Chapter 36 in 2005, thus they are technically not part of the joint planning process in groundwater management areas.

44 TWC§35.020

45 By statute, adopted regional water plans are due to the TWDB by January 5, 2011. By this time, initially prepared plans have already been submitted to the TWDB, and the planning groups have held meetings to take public comment.

46 Groundwater availability numbers are needed before regions can evaluate and consider different water management strategies.

47 TWC§356.33
values in the 2011 regional water plans rests with the regional water planning groups.

By the fourth round of regional water planning (2012–2017), managed available groundwater based on the districts’ desired future conditions should be available for use in all regional water plans. Once districts establish their desired future conditions, they may update them at any time but at a minimum of once every five years. Because of the nexus between desired future conditions and regional water planning, we recommend that districts follow a schedule that allows them to sync their latest desired future conditions with regional water planning.

VIII. TWDB SUPPORT

The water code lists the TWDB’s involvement as providing values of managed available groundwater and participating in the petition process when someone wants to protest a desired future condition. Our interpretation of “provide” is that the TWDB will estimate managed available groundwater and then deliver the information to the districts and regional water planning groups.

Although statute does not require the TWDB’s involvement until we receive the desired future conditions statements, we recommend that districts in the groundwater management areas include us early in the groundwater management area process. One reason for this is to coordinate our technical assistance and to ensure, as much as possible, a smooth path to managed available groundwater. Another reason is that the TWDB can also be a resource recording and reporting on what districts in each groundwater management area are doing and can be a clearinghouse on information concerning joint planning in groundwater management areas.

Statute requires districts to consider groundwater availability models when deciding on desired future conditions. TWDB staff can provide technical assistance on the groundwater availability models to help districts decide which desired future conditions to use. We recommend an iterative process for coming to consensus on desired future conditions, similar to the process described for consensus yield in Mace and others (2001). With an iterative process, the districts would investigate various desired future conditions or several permutations of a desired future condition before settling on a final condition. We encourage districts to submit model run requests as soon as possible. Our priority list gives greater weight to model requests to evaluate desired future conditions (Appendix F).

Besides attending meetings, coordinating technical assistance, and running models, the TWDB has developed guidance documents and provided training to districts in public participation and conflict resolution. We also maintain a list of frequently asked questions on our Web page: http://www.twdb.state.tx.us/GwRD/GCD/faqmain.htm

IX. SUMMARY

Groundwater management areas have been around for more than 50 years. However, they have assumed greater importance with the passage of House Bill 1763 in 2005, a bill that resulted in several fundamental changes in how groundwater availability is determined and used in Texas. The more important changes include (1) regionalizing decisions on groundwater availability, (2) requiring regional water planning groups to use groundwater availability numbers developed from the groundwater management area process, and (3) requiring a permitting target for groundwater production. This new process involves (1) groundwater conservation districts developing desired future conditions for the groundwater resources in the groundwater management areas, (2) the TWDB providing values of managed available groundwater based on the desired future conditions to the districts and regional water planning groups, and (3) the districts and the regional water planning groups including the values of managed available groundwater in their plans. There are also processes in place to challenge desired future conditions and the implementation of desired future conditions.

The desired future conditions that districts develop for their groundwater management area apply not only to their districts, but also to the areas outside of their districts for regional water planning purposes. For managed available groundwater values to be included in the next round of regional water planning, districts either had to have submitted their desired future conditions before the end of 2007 (in order for TWDB to require their use in the next round of regional water plans) or sometime in 2008 with the cooperation of the regional water planning groups. The TWDB is providing technical assistance to the districts in support of joint planning in the groundwater management areas as much as possible. Because of the anticipated backlog of groundwater availability model run requests, we encourage districts to submit their requests for model runs as soon as possible.

In Tennessee Williams’ play, “A Streetcar Named Desire,” Blanche DuBois rides a New Orleans’ streetcar on her way from bankruptcy and loneliness to more heartbreak. In Texas, a streetcar named Desired Future Conditions will hopefully carry us to a more desirable destination: managed available groundwater. Working together, we should be able to get there.

48 The statute does not provide for changes to be made more frequently than every five years from the date of the first change; however, there is also no prohibition against more frequent changes.
X. ACKNOWLEDGMENTS

We are grateful for the reviews and comments of Merry Klonower in the preparation of this paper. Our paper has also benefited from discussions and guidance from Carolyn Brittin, Ron Fieseler, and Ron Pigott. We are also grateful to Luanna Buckner for providing the quote on groundwater management areas in the South Central Texas Regional Water Plan.

**Legislative History Concerning Groundwater Management Areas**

<table>
<thead>
<tr>
<th>Legislative act</th>
<th>Legislature</th>
<th>Major provisions or changes</th>
</tr>
</thead>
</table>
| House Bill 162  | 51st, 1949  | • Authorized petition process for designating underground water reservoirs and creating underground water conservation districts.  
• Amended in 1955 to authorize Texas Board of Water Engineers to designate underground water reservoirs on its own motion. |
| House Bill 2    | 69th, 1985  | • Changed underground water reservoirs to management areas. |
| Senate Bill 1212| 71st, 1989  | • Changed management areas to underground water management areas.  
• Repealed underground water management area delineation requirements for legislatively-created districts.  
• Required groundwater conservation districts to develop comprehensive groundwater management plans. |
| House Bill 2294 | 74th, 1995  | • Replaced references to underground water management areas and underground water reservoirs with groundwater management areas and groundwater reservoirs, respectively. |
| Senate Bill 1   | 74th, 1997  | • Required certain content in groundwater management plans.  
• Created the regional water planning process.  
• Groundwater management plans needed to address water supply needs not in conflict with the appropriate regional water plan. |
| Senate Bill 2   | 77th, 2001  | • Authorized the Texas Water Development Board to designate groundwater management areas that would include all major and minor aquifers of the state.  
• Required groundwater conservation districts to share groundwater management plans with other districts in the groundwater management area.  
• Allowed a groundwater conservation district to call for joint planning among districts in a groundwater management area.  
• Removed the requirement for a groundwater management area or a priority groundwater management area to exist to create a groundwater conservation district by petition. |
| House Bill 1763 | 79th, 2005  | • Required groundwater conservation districts in groundwater management areas to meet at least once every year and to define the desired future conditions of the groundwater resources within the groundwater management area.  
• Based on the desired future conditions, the Texas Water Development Board delivers managed available groundwater values to groundwater conservation districts and regional water planning groups for inclusion in their plans. |
| Senate Bill 3   | 80th, 2007  | • Added a policy statement that encourages public participation in the joint planning process by those not represented by a groundwater conservation district. |

Information through 1997 is after TNRCC and TWDB (2001).
Appendix B
Quick Reference Sheet to Groundwater Statute and Rules
Related to Groundwater Management Areas

**Texas Water Code**

TWC§16.053(e)(3)(a)  Requirement for regional water planning groups to use managed available groundwater.
TWC§35.007  Identifying, designating, and delineating priority groundwater management areas.
TWC§36.002  Ownership of groundwater.
TWC§35.004  Designation of groundwater management areas.
TWC§36.1071  Groundwater management plan.
TWC§36.1072  Texas Water Development Board review and approval of management plan.
TWC§36.108  Joint planning in groundwater management area.
TWC§36.1132  Permits based on managed available groundwater.

**Texas Administrative Code**

TAC§356.2  Definitions
TAC§356.10  Possible conflicts of a groundwater management plan with the state water plan.
TAC§356.11  Appealing approval of the desired future conditions of the groundwater resources.
TAC§356.23  Designation of groundwater management areas.
TAC§§356.31–35  Submittal of desired future conditions.
TAC§§356.41–46  Appealing approval of desired future conditions.

Appendix F
Priority List for Making Model Runs with the Groundwater Availability Models

The following list represents which model run requests will receive the highest priority.

(1) Model runs to estimate managed available groundwater based on a final desired future conditions statement.
(2) Model runs to provide required information for groundwater management plans.
(3) Model runs to provide required information for regional water plans.
(4) Model runs to estimate managed available groundwater based on a draft desired future conditions
(5) Any other request from a groundwater conservation district or regional water planning group.

TWDB staff is currently developing required information from the models for groundwater management plans for all of the groundwater conservation districts. This will allow more time to run models on draft desired future conditions. We do not anticipate many requests from regional water planning groups until later in the next round of the regional water planning process.
