EXECUTIVE OVERVIEW

The Texas Water Development Board entered into a contract with the Brazos River Authority to perform a volumetric survey of Belton Lake. The goal of the study was to produce updated elevation-area and elevation-volume tables using current GPS, acoustical depth sounder and GIS technology.

Records indicate the top of the conservation pool for Belton Lake is at elevation 594.0 feet above mean seal level. A lake boundary was digitized from digital orthophoto quadrangle images (DOQ's). Depth and positional data were collected along a layout of transects or pre-plotted navigation lines spaced approximately 500 feet apart using commercially available software.

Data were collected at Belton Lake during the period of May 13 through May 21, 2003. The water levels varied between 594.0 ft and 594.2 ft. Approximately 120,500 data points were collected over 290 miles.

Post-processing the data included removing any depth spikes and erroneous depths caused by vegetation interference. All the edited files were combined into an X, Y, and Z (latitude, longitude and elevation) file and imported into a popular GIS software package. The digitized boundary file and point file were then used to create a Digital Terrain Model (DTM) of the lake's bottom surface using a Triangulated Irregular Network (TIN) software module. Volumes and areas were calculated from the TIN for the entire lake at one-tenth of a foot interval from the lowest elevation to the contour used for the lake boundary.

The result of the current survey indicates the lake encompasses 12,135 surface acres and contains a total of 435,225 ac-ft at the top of conservation pool elevation 594.0 ft. When compared to the TWDB 1994 survey, which found 12,385 surface acres and a total volume of 434,500 ac-ft; there is a 2% reduction in surface area and a 2% increase in total volume at the top of conservation pool.

VOLUMETRIC SURVEY REPORT

ON BELTON LAKE

SURVEY OF MAY 2003

INTRODUCTION

Staff of the Surface Water Resources Division of the Texas Water Development Board (TWDB) conducted a volumetric survey of Belton Lake during the period of May 13 and May 21, 2003. The primary purpose of the survey was to determine the total volume when the lake is at conservation pool elevation (CPE) 594.0 feet above mean sea level¹. See references on page 13. For the purpose of this report, the term “top of conservation (TOC) pool” will be used to mean the conservation pool elevation (594.0 feet) for Belton Lake. The results of the current survey will be compared to the baseline survey performed by TWDB in September of 1994. Survey results are presented in the following pages in both graphical and tabular form.

The vertical datum used during this survey is that used by the United States Geological Survey (USGS) for the lake elevation gage at Belton Lake. The station number and name is 08102000 Belton Lk nr Belton, TX². The datum for this gage is reported as mean sea level (msl) NGVD29 (USGS, 2002). Thus, elevations are reported here in feet (ft) above mean sea level (msl) NGVD29. Volume and area calculations in this report are referenced to water levels provided by the USGS gage.

Original design information for Belton Lake is based on information furnished by the U.S. Army Corps of Engineers³. The equipment and methodology used in the current survey is similar to that used in the September 1994 TWDB survey. Please refer to the Volumetric Survey of Belton Lake (TWDB 1994) for more information⁴.

PERTINENT DATA

Table 1. Belton Dam and Belton Lake Pertinent Data

Owner of Dam and Facilities:

U. S. Army Corps of Engineers

Operator of Dam and Facilities:

U. S. Army Corps of Engineers, Fort Worth District

Engineer and General Contractor

U. S. Army Corps of Engineers (Design)

J. W. Morgan & Son of Snyder (General Contractor)

Location:

Belton Lake is located in Bell County on the Leon River, tributary of the Brazos River (Figure 1).

Purpose:

Multi-purpose reservoir for flood control, water supply and recreation⁵.

Authorization:

Federal: Federal Flood Control Act of July 24, 1946, modified by the Federal Flood Control Act 1954⁶.

State: Certificate of Adjudication 12-2936 was issued by the Texas Water Commission on April 30, 1984, to the United States Army Corps of Engineers to divert 12,000 ac-ft of water for use at Fort Hood⁷.

Certificate of Adjudication 12-5160 was issued by the Texas Water Commission⁸ on December 14, 1987 to the Brazos River Authority (BRA) to impound 457,600 ac-ft of water in Belton Lake between elevations 540.0 ft. and 594.0 ft. The BRA was authorized a priority right to divert and use not to exceed 95,000 ac-ft of water per annum for municipal purposes, 150,000 ac-ft of water for industrial, 100,000 ac-ft of water for irrigation purposes and 50,000 ac-ft of water for mining. For detailed information about the water rights permits and the System Operation Order, refer to Volumetric Survey of Belton Lake (TWDB, 1994). The following information was obtained from the U. S. Army Corps of Engineers' website⁹.

Drainage area

3,560 square miles

Dam

Type:	Rolled earth fill
Length:	5,524 ft (including spillway and 418-ft dike)
Maximum height:	192 ft (above natural streambed)
Top width:	30 ft

Spillway

Type:	Broad-crested weir
Control:	Uncontrolled
Length:	1,300 ft
Crest elevation:	631.0 ft

Outlet works

Type:	1 conduit, 22 ft diameter with 3 inlets
Dimensions:	Tower- 22 ft diameter
Invert elevation (lowest gate):	483.0 ft
Control:	3 broome-type gates, each 7 ft by 22 ft

Low-Flow Outlets

Type:	1 – 3 ft by 3 ft gated outlet discharging into flood control conduit.
Invert Elevation:	540.0 ft msl (at intake to wet well)

Reservoir Data

FEATURE	ELEVATION (Feet)	CAPACITY (Acre-Feet)	AREA (Acres)
Top of Dam	662.0	-----	-----
Maximum Design Water Surface	656.9	1,876,700	37,340
Top of Flood control and Spillway Crest	631.0	1,097,600	23,620

The following information was obtained from the TWDB 1994 Volumetric Survey of Belton Lake⁴:

FEATURE	ELEVATION (Feet)	CAPACITY (Acre-feet)	AREA (Acres)
Top of Conservation Storage Space	594.0	434,500	12,385
Service outlet (invert)	540.0	52,401	2,961
Lowest gated outlet (invert)	483.0	0	0

The following information was obtained from the TWDB 2003 Volumetric Survey of Belton Lake:

FEATURE	ELEVATION (Feet)	CAPACITY (Acre-feet)	AREA (Acres)
Top of Conservation Storage Space	594.0	435,225	12,154
Service outlet (invert)	540.0	52,618	2,987
Lowest gated outlet (invert)	483.0	0	0

VOLUMETRIC SURVEYING TECHNOLOGY

The equipment used to perform the latest volumetric survey consisted of a 23-foot aluminum tri-hull SeaArk craft with cabin, equipped with twin 90-Horsepower Honda outboard motors. (Reference to brand names throughout this report does not imply endorsement by TWDB). Installed within the enclosed cabin are a Coastal Oceanographics' Helmsman Display (for navigation), an Innerspace Technology Model 449 Depth Sounder and Model 443 Velocity Profiler, Trimble Navigation, Inc. AG132 GPS receiver with Omnistar differential GPS correction signal and PC. A water-cooled 4.5 kW generator provides electrical power through an in-line uninterruptible power supply.

In shallow areas and where navigational hazards such as stumps were present, a 20-foot aluminum shallow-draft flat bottom SeaArk craft with cabin and equipped with one 100-horsepower Yamaha outboard motor was used. The portable data collection equipment on-board the boat included a Knudsen 320 B/P Echosounder (depth sounder), a Trimble Navigation, Inc. AG132 GPS receiver with Omnistar differential GPS correction signal and a laptop computer.

The GPS equipment, survey vessel, and depth sounder in combination provide an efficient hydrographic survey system. As the boat travels across the pre-plotted transect lines, the depth sounder takes approximately ten readings of the lake bottom each second. The depth readings are stored on the computer along with the positional data generated by the boat's GPS receiver. The data files collected are downloaded and transferred to the office for editing after the survey is completed. During editing, poor-quality data is removed or corrected, multiple data points are averaged to one data point per second, and the average depths are converted to elevation readings based on the water-level elevation recorded on the day the survey was performed. Accurate estimates of the lake volume can then be determined by standard Geographic Information System (GIS) analysis using the collected data.

PRESURVEY PROCEDURES

The lake's boundary was digitized using Environmental Systems Research Institute's (ESRI) ArcGIS from digital orthophoto quadrangles (DOQ's). VARGIS of Texas LLC produced the DOQ's for the Texas Orthoimagery Program (TOP). The DOQ's produced for the Department of Information Resources and the GIS Planning Council under the TOP reside in the public domain. More information can be obtained on the Internet at <http://www.tnris.state.tx.us/DigitalData/doqs.htm>. The lake elevations at the time the DOQ's were photographed (January 19, 1995, January 23, 1995 and January 31, 1995) were 594.2 ft, 594.18 ft, and 594.18 ft., respectively. The lake and island boundaries were given an elevation of 594.2 ft and TWDB Staff utilized these updated boundary conditions in modeling Belton Lake for this report. The lake elevations varied between elevation 594.28 ft and 594.36 ft during the survey (May 13, 2003 through May 21, 2003).

The survey layout was designed by placing survey track lines at 500-foot intervals within the digitized lake boundary using the HYPACK software. The survey design required the use of approximately 600 survey lines placed perpendicular to the original river channel and tributaries along the length of the lake. The survey track lines (transects) are similar to those track lines designed for the 1994 TWDB survey.

SURVEY PROCEDURES

The following procedures were followed during the volumetric survey of Belton Lake performed by the TWDB. Information regarding equipment calibration and operation, the field survey, and data processing is also presented.

Equipment Calibration and Operation

Prior to collecting data onboard the Hydro-survey boat, the depth sounder was calibrated with the Innerspace 443 Velocity Profiler, an instrument used to measure the variation in the speed of sound at different depths in the water column. The average speed of sound through the entire water column below the boat was determined by averaging local speed-of-sound measurements collected through the water column. The velocity profiler probe was first placed in the water to acclimate it. The probe was next raised to the water surface where the depth was considered zero. The probe was then gradually lowered on a cable to a depth just above the lake bottom, and then raised again to the surface. During this lowering and raising procedure, local speed-of-sound measurements were collected, from which the average speed was computed by the velocity profiler. This average speed of sound was entered into the ITI449 depth sounder, which then provided the depth of the lake bottom. The depth was then checked manually with a weighted measuring tape to ensure that the depth sounder was properly calibrated and operating correctly.

While collecting data onboard the River Runner (shallow draft) boat, the Knudsen depth sounder was calibrated using the DIGIBAR-Pro Profiling Sound Velocimeter by Odem Hydrographic Systems. The steps to determine the speed of sound are similar to those used for the Innerspace 443 Velocity Profiler. The probe was first placed in the water to acclimate it, then raised to the water surface where the depth was considered zero. The probe was then gradually lowered on a cable to a depth just above the lake bottom, and then raised again to the surface. During this lowering and raising procedure, local speed-of-sound measurements were collected, from which the average speed was computed by the velocimeter. The speed of sound was then entered into the bar check feature in the Knudsen software program. The depth was then checked manually with a stadia (survey) rod or weighted measuring tape to ensure that the depth sounder was properly calibrated and operating correctly.

The speed of sound in the water column varied from 4,883 feet per second to 4,910 feet per second during the Belton Lake survey. Based on the measured speed of sound for various depths and the average speed of sound calculated for the entire water column, the depth sounder is accurate to within ± 0.2 ft. An additional estimated error of ± 0.3 ft arises from variation in boat inclination. These two factors combine to give an overall accuracy of ± 0.5 ft for any instantaneous reading. These errors tend to be fairly minimal over the entire survey, since some errors are positive and some are negative, canceling each other out.

During the survey, the horizontal mask setting on the onboard GPS receiver was set to 10 degrees and the PDOP (Position Dilution of Precision) limit was set to seven to maximize the accuracy of the horizontal positioning. An internal alarm sounds if PDOP rises above seven to advise the field crew that the horizontal position has degraded to an unacceptable level. Further positional accuracy is obtained through differential corrections from the Omnistar receiver. The lake's initialization file used by the HYPACK data collection program was set up to convert the collected Differential GPS positions to NAD 83, State Plane, Texas Central Zone coordinates on the fly.

Data Collection

TWDB staff collected data at Belton Lake for approximately 7 days during the period of May 13 through May 21, 2003. The USACE were able to maintain the lake levels above TOC pool during the survey. The lake level elevations varied between 594.26 ft and 594.00 ft, thus allowing the survey crew to collect data in most areas of the lake that would be inundated at TOC pool.

The design layout for collecting data at Belton Lake required pre-plotting transects (range lines) that were perpendicular to the old river and creek channels. These transects had an average spacing of 500 ft. While collecting data, the boat operator would steer the boat on course (with GPS navigation) starting from one shore and

heading to the opposite shore. The data collector would monitor the data display and depth sounder to make sure the latitude, longitude and depth (x,y,z) values were being logged; adjustments can be made if the instruments start receiving bad data. The depth sounder and GPS equipment records 10 data points every second. These points are averaged to one data point per second for generating the model; the distance between data points depends on the speed of the boat. The maximum distance between averaged data points during the resurvey of Belton Lake was approximately 30 ft.

Over 120,000 data points were collected over the 290 miles traveled during the data collection phase of Belton Lake. These points were stored digitally on the boat's computer in 577 data files. Data were still collected in those areas where the crew was not able to stay on course due to obstructions. Data were not collected in areas with significant obstructions or where the water was too shallow. Figure 2 shows the actual location of all data points collected.

Data Processing

The collected data were downloaded from diskettes onto TWDB's network computers. CD backups were made for future reference as needed. To process the data, the EDIT routine in the HYPACK Program was run on each raw data file. Data points such as depth spikes or data with missing depth or positional information were deleted from the files. A correction for the lake elevation at the time of data collection was also applied to each file during the EDIT routine. After all adjustments had been made to the raw data files, the edited files were saved. The edited files were then combined into a single X, Y, Z data file, to be used with the GIS software to develop a model of the lake bottom elevation.

The resulting data file was imported into Environmental System Research Institute's (ESRI) Arc/Info Workstation GIS software. This software was used to convert the data to a MASS points file. The MASS points and the boundary file were then used

to create a Digital Terrain Model (DTM) of the lake's bottom surface using Arc/Info's TIN software module. The module generates a triangulated irregular network (TIN) from the data points and the boundary file using a method known as Delauney's criteria for triangulation. A triangle is formed between three non-uniformly spaced points, including all points along the boundary. If there is another point within the triangle, additional triangles are created until all points lie on the vertex of a triangle. All of the data points are used in this method. The generated network of three-dimensional triangular planes represents the bottom surface. With this representation of the bottom, the software then calculates elevations along the triangle surface plane by determining the elevation along each leg of the triangle. The lake area and volume can be determined from the triangulated irregular network created using this method of interpolation.

Volumes and areas were calculated from the TIN for the entire lake at one-tenth of a foot interval from the lowest elevation to the contour used for the lake boundary during the current survey. The surface areas and volumes of the lake were computed from elevation 481.1 ft to 594.2 ft using Arc/Info Workstation software. The computed lake volume and area tables are presented in Appendix A and Appendix C, respectively for the 2003 Belton Lake Survey. The 1994 lake volume and area tables are presented in Appendix B and Appendix D. An elevation-volume graph and an elevation-area graph including both surveys are presented in Appendix E and Appendix F, respectively.

Figures 3, 4, and 5 were developed by converting the TIN model to a lattice using the TINLATTICE command and then to a polygon coverage using the LATTICEPOLY command. Ranges of elevation were assigned to the polygons for Figure 3 (Elevation Relief Map) and associated depth ranges assigned for Figure 4 (Shaded Depth Ranges Map). Linear filtration algorithms were then applied to the DTM to produce smooth cartographic contours. The resulting contour map of the bottom surface at 5-ft intervals is presented in Figure 5. Finally, endpoint coordinates for 35 range lines can be found in Appendix G. These range lines were used in comparing the current TWDB TIN model (2003) and a TIN model based on the 1994 data using the current boundary conditions. Differences between cross-sections are partially due to the fact that the 2003 range lines do not exactly match the range lines driven in the 1994 survey and in the way Arc/Info

interpolates between points in developing the TIN model. The range line plots are presented in Appendix H.

RESULTS

Results from the 2003 TWDB Survey indicate Belton Lake encompasses 12,135 surface acres and contains a total volume of 435,225 ac-ft at TOC pool. The length of the shoreline at the digitized elevation of 594.2 ft was calculated to be approximately 153 miles. The deepest point physically measured during the survey was at elevation 481.0 ft corresponding to a depth of 113 ft from TOC pool and was located approximately 1900 ft upstream of Belton Dam.

SUMMARY AND COMPARISONS

The Federal Flood Control Act of July 24, 1946 (modified September 3, 1954) authorized the construction of Belton Dam and creation of Belton Lake. Construction commenced in July 1949. Deliberate impoundment began March 8, 1954. Original design information, based on 1936, 1937 and 1948 surveys estimated the volume of the lake at TOC pool to be 457,600 ac-ft with surface area of 12,300 acres. Prior to this report, the most recent volumetric survey report on Belton Lake was published by the TWDB in December 1994.

At TOC pool, the 2003 TWDB survey calculated 12,135 surface acres and reports a volume of 435,225 ac-ft. The capacity of the active pool (conservation storage) between elevations 594.0 ft and 483.0 ft is 435,225 ac-ft. The dead pool storage or that capacity of water below the invert of the lowest outlet (elevation 483.0 ft) was negligible.

The 1994 elevation-area-capacity table indicates that Belton Lake had a volume of 434,500 ac-ft and a surface area of 12,385 acres at TOC pool.

Despite the similarity in total capacity of the lake as estimated by the 1994 and 2003 surveys, there are some rather large differences in the surveys when comparing the bathymetry at the range lines. A good example is SR18, where the navigational difficulties caused different boat paths in the vicinity and resulted in drastically different software extrapolations to the cross-section (see Figure 6).

A comparative summary of the historical data and the results of the TWDB 2003 resurvey are presented in Table 2. Comparisons between initial volume calculations and the TWDB volumetric surveys are difficult and some apparent changes might simply be due to methodological differences. The 1994 and 2003 volumetric survey results are within the margin of error and are essentially identical. In fact the methodology and experience of the staff have improved since 1994 and so it is recommended that more reliance be placed on the current survey. It is recommended that a similar survey be performed in five to ten years or after major flood events to monitor changes to the lake's capacity.

Table 2. Area and Volume Comparisons of Belton Lake

FEATURE	USACE Original Design	USACE Re-Survey	USACE Re-Survey	TWDB Volumetric	TWDB Current Survey
Year	1948	1961	1966	1994	2003
Area (acres)	12,300	12,420	12,423	12,385	12,135
Volume (ac-ft)	457,600	447,500	441,984	434,500	435,225

Notes:

1. All pre-1994 data provided by the U. S. Army Corps of Engineers, Fort Worth District
2. All results from top of conservation pool elevation 594.0 ft
