Re: Visual Structural Observation of bridges along the Raymondville Drain Channel.

Dear Mr. Espinoza

In accordance with your request and authorization we are providing you the following preliminary report on our findings for the above-mentioned project.

#### PURPOSE, SCOPE AND METHODOLOGY

The North Main Drain Channel carries storm water from metropolitan areas in the Rio Grande Valley, starting west of McAllen, to the Gulf of Mexico. A new route has been proposed for the areas west of McAllen to flow into the Raymondville Drain Channel (RDC) instead of the North Main Drain Channel. Because of the added volume of storm water that will be carried by the RDC, a check of the existing capacity of the channel, and structures along it, is needed.

Hinojosa Engineering, Inc. was asked by Turner Collie & Braden, Inc. to perform a preliminary visual structural observation on the existing bridges along the RDC. Observations are of the exterior of the structure, both above and below the driving surface and are limited to components of the bridge that are readily visible without removing items causing visual obstruction. This structural observation is a preliminary report of first impression conclusions and/or recommendations only.

Hinojosa Engineering, Inc. performed the observations on June 15 and June 19, 2000. The process consisted of driving along the RDC and inspecting the structure at every major highway, farm road and county road.

#### **CONCLUSIONS**

Based on our visual structural observations, in our opinion the bridge structures are in good conditions, except for the bridge at County Road #121. The supporting beams at this bridge have failed in flexure, leading to exposed steel reinforcing (see Figure 49), and in shear (see Figures 48, 51-53). The beams at the end of the bridge have eroded (see Figure 50). Structural repairs are foreseen for this bridge structure.
