POPULATION PROJECTIONS FOR TEXAS
STATE, COUNTY, STATE PLANNING
REGION AND 208 WATER QUALITY
DESIGNATED AREAS

December, 1979

Prepared by the
Economics, Water Requirements and Uses Section
of the Planning and Development Division

Texas Department of Water Resources
LP - 126
January 22, 1980
Introduction

The Texas Department of Water Resources is directed by State statutes to plan the development of the State's water resources.¹ Part of the planning process involves estimating future water demands in all parts of the State, based on projections of growth patterns and population change.

Historically, the Department has maintained a set of long-range population projections for Texas counties since 1965. When available information has indicated an existing set of projections no longer reflected the prospects for population change, the Department has revised the entire series. The projections presented here are the results of the latest revision by the Department and reflect the latest available information.

On August 10, 1979, the Texas Department of Water Resources distributed Population Projections for Texas (6, 1979), which contained county, state planning region and 208 Water Quality Designated Area population projections proposed for use in the development of waste treatment facility plans pursuant to Title II, Grants for Construction of Treatment Works, of the Clean Water Act of 1977. Subsequently, on September 26, 1979, the Texas Department of Water Resources held a public meeting to obtain local input and to receive public comments concerning the proposed projections.

¹Acts, 1965, 59th Leg., V.A.C.S. 8280(b).
Since September, the Department has reviewed all comments and information submitted at the public meeting, acquired additional data and written comments from persons unable to attend the meeting and made special trips to the areas where the proposed projections were questioned by the staffs of councils of governments and other interested parties. In addition, a review of all county projections was conducted utilizing the latest population statistics available to the Department.

As a result of this review process, some county projections were modified when the preponderance of the latest statistics on population trends indicated a need for revision. The resulting state projection, as well as the projections for the seven 208 Water Quality Designated Areas, are consistent with the rules and regulations for water quality planning as set forth by the U. S. Environmental Protection Agency.

Methods

A variation of the cohort survival-migration component method was used in developing population projections for the State of Texas and each of the 254 counties. The components of population change are natural increase and migration. Natural increase is the result of births less deaths. Net migration is the balance of in-migrants less out-migrants.

---

The base unit used in the projections is a five-year age cohort. There are 16 cohorts for each sex. The terminal cohort represents persons 75 years and older. For projection purposes, the population is divided into three ethnic groups: white, non-white and Spanish surname.

The projection method produces estimates of population by county and cohort for each five-year interval through the year 2000. The procedure consists of three major steps at each time interval:

1) estimation of births;
2) estimation of deaths to each cohort; and,
3) estimation of net migration for each cohort.

Birth Component

Five-year fertility rates for the eight female child-bearing cohorts (between the ages of 10 and 49) for the white and non-white groups were developed from U. S. Bureau of the Census estimates in "Projections of the Population of the United States: 1975 to 2050" (1, 1975). Current Spanish surname fertility rates were developed from Texas Department of Health data (7, 1977), since Census estimates and forecasts of these rates were unavailable. Although fertility rates among the ethnic groups are different, the data show that the rate of change of fertility rates over time is quite similar for the different groups and thus, it was assumed that the Spanish surname fertility rates would change over time at the same rate as projected changes for the non-white group.
The fertility rates for the three ethnic groups were applied to the child-bearing female cohorts to obtain a five-year estimate of births for each county for 1970-75. The county birth estimates were compared to reported birth data for that period. The ratio of reported births to estimated births was used to derive county-specific fertility rates for each ethnic group for the succeeding time periods. These county-specific fertility rates were used to estimate births for the remainder of the projection period. Fifteen-year averages of ethnic-specific male to female birth ratios from the records of the Texas Department of Health (7, 1977) were applied to the estimated total births to obtain estimates of male and female births.

Death Component

Survival rates for each cohort for each five-year interval were derived from U. S. Bureau of the Census estimates (1, 1975). Deaths were estimated at each five-year period by applying the survival rates to each cohort, including the estimated births. Prior to calculation of net migration, deaths were deducted from the base population to estimate the expected population for the following time period.

Migration Component

Migration rates for each county and each cohort were used to estimate net migration. The rates were developed using data from the U. S. Census of Population for 1950, 1960, and 1970. Historical migration rates for two different time periods, 1950-1970 and
1960-1970 (4, 1975; 5, 1965) were applied to the 1970 population to estimate net migration from 1970 through 1976. The historical rate which most accurately projected the 1976 population for each county, as estimated by the U. S. Bureau of the Census in annual estimates of net migration by county for the period 1971 through 1976 (3, 1978), and by other sources of information about county migration patterns, was used for the remaining time periods.

State projections for each cohort were developed in five-year intervals. The cohort totals for each interval were used as control totals for the county projections. For all counties, population by cohort was then projected, summed, and adjusted proportionately to the State control totals for each five-year interval.

NOTE: The population projection data included in this publication are available in machine processable form through the Texas Natural Resources Information System (TNRIS) by contacting:

TNRIS Systems Central
