Austin, TX 78711-3231, [www.twdb.texas.gov](http://www.twdb.texas.gov)  
Phone (512) 463-7847, Fax (512) 475-2053

## MEMORANDUM

**TO:** Regional Water Planning Groups

**FROM:** Dan Hardin, Director, Water Resources Planning Division, Texas Water Development Board (TWDB) *DH*

**DATE:** January 11, 2013

**SUBJECT:** Proposed Mining Demands for 2016 Regional Water Plans and 2017 State Water Plan

Attached are the TWDB's recommended demand projections for mining demands. The data is based on a study titled "Oil and Gas Water Use Report: Update to the 2011 Mining Water Use Report", which is available on the TWDB's website at:

[http://www.twdb.state.tx.us/waterplanning/rwp/planningdocu/2016/current\\_docs.asp](http://www.twdb.state.tx.us/waterplanning/rwp/planningdocu/2016/current_docs.asp).

The report is an update to the TWDB study conducted in 2011. The update was conducted by the University of Texas, Bureau of Economic Geology for the Texas Oil and Gas Association. TWDB reviewed and agreed with the methodology used in the study and reviewed the draft updated report and had no comments.

This report includes 2011 mining water use estimates as well as projected water demands for 2020 – 2060. TWDB requests that the regional water planning groups review the attached projections and provide any requests for revisions to the TWDB, along with the necessary data to justify such requests, no later than **March 29, 2013**.

Part of the update involves a distinction between Total Water Demands (fresh, saline, treated effluent and recycled water) and Fresh Water Demands (described as 'consumptive use' in the report). In previous regional water plans, water demands for mining have been equivalent to what is presented in this report as Total Water Demands. The spreadsheet includes both Total and Fresh water demand projections. As in previous rounds of planning, Total water demand will be used to represent mining demand, however, the fresh water demand estimates are also provided as information to be considered as the planning groups evaluate existing supplies or water management strategies, if appropriate. Water demand volumes for the non-oil and gas mining sectors are considered fresh water demands unless otherwise specified in the 2011 report.

### Our Mission

To provide leadership, planning, financial assistance, information, and education for the conservation and responsible development of water for Texas

### Board Members

Billy R. Bradford Jr., Chairman	Lewis H. McMahan, Member
Joe M. Crutcher, Vice Chairman	Edward G. Vaughan, Member
Melanie Callahan, Executive Administrator	

Monte Cluck, Member  
F.A. "Rick" Rylander, Member

The 2070 projections have been calculated by TWDB staff using the 2050-2060 trends in the report.

A summary of the updated report follows:

**SUMMARY - Oil and Gas Water Use Report: Update to the 2011 Mining Water Use Report**

This updated report employs similar methodology as the 2011 report but differs in several ways, notably:

- Clearly distinguishes between water use and water consumption;
- Includes information on the increased use of brackish water, reused produced water and recycled water from other users; and
- Presents high, low and mostly likely water use scenarios. The most likely scenario is the one recommended for use in regional water planning.

Specific, updated findings since the publication of the 2011 report include:

- An increasing proportion of the total water used is from non-potable sources.
- The oil and gas industry has been developing more water efficient techniques for operations.
- Overall, the total water use for hydraulic fracturing has increased from 36,000 acre-feet in 2008 to approximately 81,500 acre-feet in 2011 (See “Report,” Fig. ES1, p. i)
- The amount of recycling/reuse and brackish water use has also increased to approximately 17,000 acre-feet in 2011, 21 percent of the total.
- The Anadarko Basin has hosted much recycling and reuse (estimated at 20 percent) and use of brackish water (estimated at 30 percent).
- For the most part in the Barnett Shale, operators use fresh water (estimated at 80 percent of “new” water). Overall, little recycling/reuse or brackish water use is occurring in this shale gas play.
- Operators in Eagle Ford Shale rely mostly on groundwater, and there is a significant amount of brackish water being used.
- In the Haynesville and East Texas Basin, about 70 percent of the “new” water is groundwater. Water is generally plentiful in East Texas and no significant recycling/reuse and use for brackish water was documented during this updated study.

- The Permian Basin used a significant (30 percent or more) of brackish water in hydraulic fracturing water. Nearly all water used in this region is groundwater.
- The amount of water used depends not only on the length of the well and on operator preferences but, more importantly, on localized factors. For example, in the Eagle Ford the drilling muds used in drilling through horizontal sections (for example, Fan et al., 2011) are oil-based.

In summary:

- The overall result is that the hydraulic fracturing (HF) water use will have a broad plateau at 125,000 acre-feet per year in the 2020-2030 decade and then slowly decrease over time.
- The amount of fresh water consumed (that is, not recycled or reused or brackish water) will stay relatively constant at 70,000 acre-feet per year through the next decade, despite the increase in total water use, and then slowly subside with the decrease in HF activities.
- Fresh water use will decrease for two reasons: (1) the industry is getting better at using brackish water, reusing produced water and recycling water from other users; and (2) in the long run, a greater share of the state's activity is likely to take place in the Permian Basin, where fresh water is at a premium and brackish water is already used by the industry.
- For the oil and gas industry as a whole, water use is projected to peak with a broad plateau at 180,000 acre-feet per year in the 2020-2030 decade, slowly declining to 60,000 acre-feet by 2060. Fresh water consumption in the oil and gas industry is projected to remain at a level close to 100,000 acre-feet per year through the end of this decade and then to slowly decrease to a low level of a few tens of thousands acre-feet by the middle of the century.
