    b. All water loss reduction savings associated with this activity are detailed in Section 5, which assessed utility baseline water loss GPCD and most recently reported water loss GPCD to determine water savings.

---

[15] If current water loss levels exceed a utility's baseline, this value is treated as a deduction from total quantified savings.
[16] In the absence of having a baseline figure provided in the utility's most recently submitted 5-year water conservation plan, the historic 5-year average for water loss GPCD in the plan was used.
[17] Correspondence with utility staff.
[18] We estimate 2% demand reduction with 10% increase in price on a targeted customer class. By applying a ratio, we can determine the savings for lower or higher percentage increases.

c. For estimated water savings that could be increased by implementing meter data management (MDM) and customer engagement portal applications, refer to Section 6 of this report.
d. With these additional applications, water savings can be achieved through changed customer behavior and other real-time actions that go beyond water loss reduction.

5 Summary of Savings

Table 5-1. Savings by Water Conservation Activity (MG).

Year	Water Rate Increase	TOTAL SAVINGS
2009		0
2010		0
2011		0
2012		0
2013	45	45
2014	45	45
2015	45	45
2016	45	45
2017	45	45
2018	45	45
2019	45	45

2024	23,675	41.00	(104)

6 Suggested Activities

Up to four activities were chosen as potential suggested activities for individual reports. These activities are: AMI system with customer portal, twice-per-week (or less) outdoor watering ordinances, strategic water rate increases, and rain barrels.

Activities were chosen because they are:

- Achievable
- Prevalence of vendors that can actually implement them
- Acceptability to city councils, MUD boards, et al.
- Easily adopted
- Cost effective
- Yield high savings relative to cost

AMI systems with customer engagement portals were also chosen because they represent a profusion of future applications that will undoubtedly continue to advance conservation efforts. AMI and meter data management (MDM) companies are developing new and innovative ways to benefit water providers, customers, and ultimately states that are pushing conservation and usage analytics further.

Each utility should be cognizant of the potential impact that these suggested activities may have on its own unique rate and revenue situation.

Benefits to consider:

- Avoided water supply and wastewater costs
    - The higher water purchase, transmission, and distribution costs are, the greater the potential benefit realized when large amounts of water are conserved with these activities.
- Avoided system expansion costs

- Conserving water may allow a utility to postpone building new system capacity by decreasing demand even as population grows.

Costs to consider:

- Staff time and resources
- Unit cost per unit saved
- Implementation costs
- Stakeholder agreement and support
- Other overhead and budget considerations

6.1 Suggested Activities with Savings Estimates

1. Twice-a-week Outdoor Watering Restriction Ordinance

a. Potentially 7.79% savings of total demand Hermitte and Mace, 2012; Sierra Club-Lone Star Chapter and National Wildlife Federation, 2015)

i. Average Region J savings

ii. Specific percentage of outdoor usage unknown for your utility at this time

b. Savings could be 117 MG per year with current demand.

c. See Table 6-1 for potential savings from this measure compared with the city's WMS supply volumes targets.

Table 6-1. Current Savings + Potential Savings from 2x per Week Watering Ordinance (MG).

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Potential Savings from Ordinance	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)
2016	45	(102)	(57)	117	0	27	27	33
2017	45	(102)	(57)	117	0	32	32	28
2018	45	(102)	(57)	117	0	37	37	23
2019	45	(102)	(57)	117	0	43	43	17
2020	45	(102)	(57)	117	0	48	48	12
2021	45	(103)	(57)	117	0	48	48	12
2022	45	(103)	(58)	118	0	48	48	12
2023	45	(103)	(58)	118	0	48	48	12
2024	45	(104)	(58)	118	0	48	48	12
2025	45	(104)	(59)	118	0	48	48	12
2026	46	(104)	(59)	118	0	48	48	11
2027	46	(105)	(59)	118	0	48	48	11
2028	46	(105)	(60)	119	0	48	48	11
2029	46	(106)	(60)	119	0	48	48	11
2030	46	(106)	(60)	119	0	48	48	11
2031	46	(106)	(60)	119	0	48	48	11
2032	46	(106)	(61)	119	0	48	48	11
2033	46	(107)	(61)	119	0	48	48	10
2034	46	(107)	(61)	119	0	48	48	10
2035	46	(107)	(61)	119	0	48	48	10
2036	46	(107)	(61)	119	0	48	48	10
2037	46	(108)	(62)	119	0	48	48	10
2038	46	(108)	(62)	119	0	48	48	10
2039	46	(108)	(62)	119	0	48	48	9
2040	46	(108)	(62)	119	0	48	48	9

2. Advanced Metering Infrastructure with Customer Engagement Portal

These portals, along with mobile applications and billing statements, can provide customers with much more access to their water use data in simple and compelling formats. This access and comparison with other customers' usage can reduce water use through changed behavior, as well as provide an opportunity for other conservation programs to be offered to the customer for increased adoption and additional savings. AMI systems support leak notification and web portals with real-time data. Any water loss reduction savings that these systems also yield were included in the water loss assessment of individual reports for this project.

- **a.** Specific utility results will vary based on portal features and frequency of customer notifications
- **b.** Potential savings estimate assumes 20% of residential customers will use and save water due to the portal (Westin Engineering, 2015)
- **c.** Estimate assumes customers will save 10% of total annual use due to the portal
    - i. Savings estimate of 10% is an average of results from multiple studies (Chesnutt and Mitchell, 2013; East Bay Municipal Utility District, 2014; IBM, 2011; Texas A&M and Texas Water Resources Institute, 2016; Westin Engineering, 2015)
- **d.** Residential customers' use assumed to make up approximately 67% of all retail customers' use based on utility profile information submitted to the TWDB
    - i. This was the most common percentage of residential use among participating utilities in this project.
    - ii. Actual customer class demand percentages will vary by utility.
- **e.** 20% of residential customers saving 10% with this customer class breakdown amounts to 1.34% of total demand
- **f.** Savings are assumed to increase along with demand as connections increase each year[19]
- **g.** See Table 6-2 for potential savings from this measure compared with the utility's WMS supply volumes targets.

[19] The 10% consumption reduction figure for 20% of residential customers is conservative, but savings could be greater when monitored yearly as customer engagement increases.

Table 6-2. Current Savings + Potential Savings from AMI with Customer Portal (MG).

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Potential Savings from AMI with Customer Portal	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)
2016	45	(102)	(57)	20	0	27	27	(64)
2017	45	(102)	(57)	20	0	32	32	(69)
2018	45	(102)	(57)	20	0	37	37	(74)
2019	45	(102)	(57)	20	0	43	43	(79)

2021	45	(103)	(57)	20	0	48	48	(85)
2022	45	(103)	(58)	20	0	48	48	(85)
2023	45	(103)	(58)	20	0	48	48	(86)
2024	45	(104)	(58)	20	0	48	48	(86)
2025	45	(104)	(59)	20	0	48	48	(86)
2026	46	(104)	(59)	20	0	48	48	(86)
2027	46	(105)	(59)	20	0	48	48	(87)
2028	46	(105)	(60)	20	0	48	48	(87)
2029	46	(106)	(60)	20	0	48	48	(87)
2030	46	(106)	(60)	20	0	48	48	(88)
2031	46	(106)	(60)	20	0	48	48	(88)
2032	46	(106)	(61)	20	0	48	48	(88)
2033	46	(107)	(61)	20	0	48	48	(88)
2034	46	(107)	(61)	21	0	48	48	(88)
2035	46	(107)	(61)	21	0	48	48	(89)
2036	46	(107)	(61)	21	0	48	48	(89)
2037	46	(108)	(62)	21	0	48	48	(89)
2038	46	(108)	(62)	21	0	48	48	(89)
2039	46	(108)	(62)	21	0	48	48	(89)
2040	46	(108)	(62)	21	0	48	48	(90)

3. Rain Barrels
   a. In Region J, utilities could save approximately 12.6 gallons per year per gallon of capacity rebated, sold, or distributed (GDS Associates, 2002).
   b. Estimated 10-year useful life for most barrels

Region K Individual Reports

Statewide Water Conservation Quantification Project
City of Austin Report • 2017

1 Introduction

In Texas' 2017 State Water Plan, municipal water conservation is projected to meet 9.6 percent[1] of the state's future water needs by 2070. According to the 16 regional water plans that comprise the state water plan, this is expected to be achieved through a variety of measures such as installation of water efficient plumbing fixtures, water conservation pricing structures, water system audits, landscape irrigation ordinances, as well as other water conservation activities. The 9.6 percent is "in addition to the estimated share of future passive conservation savings from plumbing codes and water efficiency standards, which are embedded in municipal water demand projections" (Texas Water Development Board, 2017).

In 2015, the Texas Legislature appropriated funds to the Texas Water Development Board (TWDB) to fund a research project principally charged with quantitatively determining the savings of municipal water conservation activities being implemented in relation to the recommended conservation goals (supply volumes) in the State Water Plan. As part of the project, individual reports were completed for all participating utilities.

With this report, utilities will benefit by receiving a clear and concise picture of its water conservation goals alongside estimated savings from quantifiable activities. In the event that current activity savings may not be able to reach long-term goals, this report offers suggestions on how utilities can reach water conservation goals with activities that are effective, easily adopted, have widespread appeal, and are quantifiable.

2 Municipal Conservation Terminology and Review of Methodology Used by Regional Planners

To make use of the results of this study, it is important to understand several key terms used in the water planning process.

What is a water user group?

In this report, a water user group (WUG) refers to a retail water provider in the form a city, municipal utility district, water control and improvement district, special utility district, water supply corporation, fresh water supply district, or other type of water utility. The TWDB further defines WUGs as one of the following (Texas Water Development Board, 2016b):

- Cities and towns with a population of 500 or more
- Non-city utilities providing more than 280 acre-feet per year per year of water for municipal use
- Collective reporting units (CRUs) consisting of grouped utilities having a common association

[1] Equal to 811,224 acre-feet per year in conservation savings.

- County-Wide WUGs:
    - County-Other (Rural/unincorporated areas of municipal water use)
    - Manufacturing
    - Steam electric power generation

What is a recommended water management strategy?

A recommended water management strategy (WMS) is a measure that will help ensure WUGs have adequate water supplies for their end users well into the future. WMS examples include river diversions, groundwater use, reservoir and aquifer development, and irrigation conservation. When WMS is referred to in this report, it refers only to municipal conservation, which may include water loss reduction as a part of the same strategy.

What is a WMS supply volume?

A WMS supply volume is the amount of water that a given strategy is expected to yield each decade in the planning period if carried out by the WUG. In this report, a WMS supply volume is the amount of water recommended to come from municipal water conservation.

Some regional water plans separate this strategy's supply volume into a volume for municipal water conservation and a volume for water loss reduction for each decade. The total strategy supply volume is the sum of both. A regional water plan may also refer to "advanced conservation" as part of this strategy. Advanced conservation usually indicates that the volume could be achieved through a more robust mix of conservation activities described in the plan.

2.1 Regional Planning Group Approach to Determining Supply Volumes

Each regional water planning group (RWPG) is responsible for producing its own individual plan that, if executed, will provide sufficient water to its WUGs throughout a 50-year planning period. These plans are completed in five-year cycles, with the most recent edition being completed in 2016. The 2016 regional plans make up the 2017 State Water Plan, which sets out WMS supply volumes for the years 2020 through 2070.

The decadal WMS supply volumes for municipal conservation were established by each of the RWPGs in much the same manner. The RWPGs generally followed the guidelines of the Texas Legislature's Water Conservation Implementation Task Force on the pace utilities should target to reduce gallons per capita per day (GPCD)[2] consumption levels.

The targeted reductions used by most regions follow this formula:

- For municipal WUGs with water use of 140 GPCD and greater, the goal is to reduce per capita water use by one percent per year until the level of 140 GPCD is reached,

[2] Regional water planning GPCD is defined as the annual volume of water pumped, diverted, or purchased minus the volume exported (sold) to other water systems or large industrial facilities divided by the permanent resident population of the Municipal Water User Group in the regional water planning process divided by 365. Saline and reused/recycled water are not included in this volume (Texas Water Development Board, 2012).

after which, the goal is to reduce per capita water use by one-fourth percent per year for the remainder of the planning period (Texas Water Development Board, 2016j).

The yearly reductions in GPCD for a given WUG are then converted into recommended supply volumes in acre-feet per year for each decade as the reductions in consumption continue. Some regions reduce GPCD by slightly different percentages before and after the 140 GPCD threshold, some do not apply further reductions in GPCD for WUGs once they reach 140 GPCD, while others recommend only "advanced conservation" activities once WUGs meet 140 GPCD.

2.2 Methodology

In order to complete a uniform quantification process, the first engagement was with utilities that agreed to participate and collected as much relevant data as possible. These data included, among many others, historical GPCD consumption figures, advanced metering infrastructure (AMI) specifications, and detailed feedback on each conservation activity being implemented. Personal interviews focused on determining when and to what extent these activities were being employed, as well as assessing plans to continue such conservation. Examples of frequently implemented activities include tiered water rate conservation pricing, strategic water rate increases, outdoor irrigation audits and ordinances, and rain barrel distribution.

Subsequently, each utility's conservation activities were quantified through several different means, including evidence-based studies, utility field results and savings determinations, manufacturer guarantees, water loss audits, TWDB studies, and other information that assigned a savings value to the activity's implementation.

Every conservation activity studied and quantified has a gallons-per-year estimate, useful life, and decay rate (if applicable) associated with it. Some activities' savings are projected to grow as demand grows over time, while some savings are constant each year and subside once useful life has run its course. For expanded methodology and details on studies and formulas used to determine activity savings, refer to Section 6 of the State Report included as part of this document.

Once analyzed, the resulting savings estimates from each utility were compared with the recommended WMS supply volumes in its respective regional plan to determine if the savings met, exceeded, or fell short of those volumes. Individual utility savings were aggregated to compare with regional volumes, and regional savings were aggregated to compare with state volumes.

It is important to note that this report quantified activity savings—not including water loss reduction—for the WMS supply volume comparison dating back to 2012. The reason for this is, with a few exceptions, the regional planners used 2011 as the base year for establishing potential WMS supply volumes.[3] In addition, any conservation savings achieved through 2011 are assumed to be accounted for in the regional water planning GPCD for that year.[4] Thus, quantifying from 2012 and forward is the most accurate way to determine if utilities are meeting

[3] Confirmed via personal communication with Region C, H, K, and L Plan consultants.
[4] It was established with TWDB planning staff that 2011 GPCD levels were chosen because they represented the most current water use and conservation patterns at the time.

the recommended conservation volumes in the regional plans. This assumption is by no means 100 percent accurate, however. Some previously implemented activities' savings persist into future years beyond this starting point, while some activities' savings have ceased. One year's GPCD will not necessarily include all savings yielded by conservation activities that came before it, but the quantification assessment must have a starting point.

2.3 Quantifiable Savings

The key to the project being useful and reliable is that the results from year to year are measurable. Quantifying conservation activities that can be accurately measured provides greater certainty and better planning for all stakeholders.

While many utilities are engaged in a variety of conservation activities, not all can currently be properly measured. Some examples of these activities include education initiatives, website and social media engagement, and enforcement for water waste. That does not mean these measures are not essential. Education of consumers, for example, is a fundamental activity that makes all others effective, but little hard data exists to quantify the results of education alone.

In addition, the work of conservation coordinators can have a particularly significant effect on the savings of all other activities, but the specific savings attributed to that staff role is difficult to quantify.

3 Results

This report compares Austin's current water conservation activities and their quantified savings to two metrics: 1) Region K Water Plan's (Texas Water Development Board, 2016i) recommended WMS supply volumes for municipal conservation, and 2) Austin's own 5- and 10-year goals as established in its most recent water conservation plan submitted to the TWDB.

The WMS supply volumes for municipal water conservation are laid out by decade (2020 – 2070) in the regional water plans to serve as benchmarks for what each utility could achieve via that strategy during a 50-year planning period.[5]

The 5- and 10-year goals in Austin's most recent water conservation plan are established by the utility as realistic targets for reducing consumption over that timeframe. These reductions[6] are expressed in decreasing total GPCD[7] consumption and water loss GPCD.[8] [9]

The estimated savings in Tables 3-1 through 3-3 indicate the best information available as

---

[5] Some regional water plans separate this strategy volume into a volume for water conservation and a volume for water loss reduction for each decade. The total strategy volume is the sum of both.

[6] Occasionally, some utilities expect consumption to increase due to various reasons, such as an incoming industrial presence expected to raise consumption figures for the entire service area.

[7] As defined in TWDB water conservation plan annual report (Texas Water Development Board, 2016o): (Total Gallons in System ÷ Permanent Population) ÷ 365

[8] These plans also have targets for residential GPCD and water loss as a percentage (rather than GPCD), but this report does not address those goals.

[9] As defined in TWDB water conservation plan annual report (Texas Water Development Board, 2016o): (Total Water Loss ÷ Permanent Population) ÷ 365

provided by utility staff. Some ongoing activities may not be known and are within a utility's service area are implemented on a micro-scale that may not be quantified. Individual households and businesses may be implementing conservation measures that are unknown and therefore cannot be included in the report.

Explanation of approach to assessing water loss reduction savings

Water loss reduction savings are defined as the volume of water participating utilities are realizing from their water loss mitigation efforts. For this report, this value is the difference between each individual utility's baseline[10] for water loss GPCD and its most recent water loss GPCD reported in 2015 water loss audits on file with TWDB. Savings from all water loss reduction efforts—including pipe replacements and leak repair—are assumed to be included in this comparison to a utility's baseline.

Note that because a single year (2015) value was used for comparison, it is possible that the 2015 value could be anomalous due to a number of events that may have occurred that year, such as a water main break, a particularly wet year, or a robust effort by the utility to curtail water loss. This will distort future savings figures that were carried forward in the study because water loss will inevitably increase or decrease in later years.

Ideally, using a rolling five-year average in the calculation would correct such anomalies. However, there was insufficient data to do that for every utility. The approach was to use the most complete water loss data possible, which was represented by the 2015 water loss audit. This problem will be further minimized, as continued data collection will allow five-year averages to be calculated for a majority of utilities.

In this way, water loss savings estimates are different from all other activity savings estimates in the project. Whether savings were positive or negative depended on where individual utilities established their own baselines or where their five-year average started, and what water loss GPCD value was reported in 2015.

3.1 Current Savings Compared to Conservation WMS Supply Volume (in Million Gallons) in Regional Water Plan

Table 3-1 shows the 2070 outlook for Austin with the utility's yearly recommended WMS supply volume in million gallons (MG) alongside its water savings from implemented activities, including from water loss reduction. These activities and their associated savings are covered in greater detail in Sections 4 and 5.

Starting in 2015, this table compares all quantified conservation activity and the recommended conservation WMS supply volume for the planning period. The following definitions pair with the column headers in Table 3-1.

<u>Actual Current Conservation Activity Savings</u> – All quantified activities currently being performed by the utility, *excluding* savings from water loss reduction. The regional planners used

[10] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.

2011 GPCD as the baseline for determining future conservation WMS supply volumes, therefore the study quantifies utility savings starting in 2012 for this comparison. The summary of these savings can be referenced in Table 5-1.

Actual Water Loss Reduction Savings (as of 2015) – The difference between the baseline[11] for water loss GPCD and most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB. [12] The summary of these savings can be referenced in Table 5-6.

Total Savings from All Conservation Activity – Actual Current Conservation Activity Savings plus Actual Water Loss Reduction Savings (as of 2015).

Conservation WMS Volume – The recommended municipal water conservation supply volume in the regional plan for the decades ranging from 2020 to 2070. These volumes are converted to MG from the values listed in the plan in acre-feet and then calculated in annual increments.

Water Loss Reduction WMS Volume – Some regional water plans have a separate WMS volume for water conservation and for water loss reduction for each decade. If a WUG's regional plan has a WMS volume for water loss reduction, this column will have values other than zero.

Total Yearly WMS Volume – The sum of the Conservation WMS Volume and Water Loss Reduction WMS Volume.

Over (Short) – The amount that the utility's Total Savings from All Conservation Activity (since 2012), is over or below the Total Yearly WMS Volume in the regional water plan. If the amount falls below the WMS volume, it will appear in parentheses.

[11] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.

[12] If water loss GPCD has increased from the utility's baseline or historic five-year average to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount.

Table 3-1. Current Savings Compared to Conservation WMS Supply Volume (MG) in Regional Water Plan.

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)
2015	8,002	(923)	7,079	3,327	0	3,327	3,752
2016	11,853	94	11,947	4,159	0	4,159	7,788
2017	11,772	96	11,868	4,159	0	4,159	7,709

3.2 Utility Water Conservation Plan Goals – Total GPCD

Table 3-2 shows how Austin's quantified savings from its implemented activities compare with 5- and 10-year goals established in its individual water conservation plan submitted to the TWDB. The following definitions pair with the column headers in Table 3-2.

Utility Population – Estimated utility service area population for the years indicated.

Total GPCD Goals – Total GPCD goals start with the utility's baseline[13] for total GPCD and progress in subsequent years to match 5- and 10-year goals indicated in a utility's five-year water conservation plan on file with the TWDB. The first five annual GPCD goals were developed by spreading the difference between the baseline and five-year goal evenly over five years. The second five annual GPCD goals spread the difference between the five-year goal and 10-year goal evenly over the next five years.

Annual Savings Goal with Reduction in GPCD (MG) – This column shows what reductions from the baseline GPCD would yield in terms of volume each year as more water is saved. The volumes indicated here are what target GPCD goals look like expressed in million gallons. Annual volumes were derived using the formula: (baseline total GPCD – target total GPCD for that year) x 365 days ÷ 1,000,000 gallons.

Total Savings for All Current Quantified Activities (MG) – Total quantified savings for all current conservation activities and savings from water loss reduction. Refer to Section 5 for details on these savings.

Over (Short) – The amount that the utility's total quantified savings for all current conservation activities (since 2012), including water loss reduction, is over or below the volume represented by reductions in GPCD each year. If the quantified savings are less than these target volumes, the value will appear in parentheses.

Table 3-2. Utility Water Conservation Plan Goals — Total GPCD.

Year #	Year	Utility Population	Total GPCD Goals	Annual Savings Goal with Reduction in GPCD (MG)	Total Savings for All Current Quantified Activities (MG)	Over (Short) (MG)
0	**Baseline**	-	162	0	0	0
1	2015	926,624	158	1,421	7,079	5,658
2	2016	951,497	154	2,917	11,947	9,030
3	2017	976,371	149	4,490	11,868	7,378
4	2018	1,001,244	145	6,140	11,645	5,505
5-year Goal	2019	1,026,118	141	7,865	11,782	3,917
6	2020	1,050,991	140	8,286	11,948	3,662
7	2021	1,072,217	140	8,688	12,125	3,436
8	2022	1,093,444	139	9,100	12,263	3,163
9	2023	1,114,670	139	9,520	12,413	2,892
10-year Goal	2024	1,135,896	138	9,950	12,557	2,607

[13] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for total GPCD from the utility's most recently submitted five-year water conservation plan was used.

3.3 Utility Water Conservation Plan Goals – Water Loss GPCD

Table 3-3 shows how Austin's most recent water loss audit compares with 5- and 10-year water loss goals in its water conservation plan. The following definitions pair with the column headers in Table 3-2.

Utility Population – Estimated utility service area population for the years indicated.

Water Loss GPCD Goals – Water loss GPCD goals start with the utility's baseline[14] for water loss GPCD and progress in subsequent years to match 5- and 10-year water loss goals indicated in a utility's five-year water conservation plan on file with the TWDB. The first five annual GPCD goals were developed by spreading the difference between the baseline and five-year goal evenly over five years. The second five annual GPCD goals spread the difference between the five-year goal and 10-year goal evenly over the next five years.

Yearly Savings Goal with Reduction in GPCD (MG) – This column shows what reductions from the baseline water loss GPCD would yield in terms of volume each year as more water is saved. The volumes indicated here are what target water loss GPCD goals look like expressed in million gallons. Annual volumes were derived using the formula: (baseline water loss GPCD – target water loss GPCD for that year) x 365 days ÷ 1,000,000 gallons.

Total Savings from Water Loss Reduction (MG) – The difference between a utility's established baseline for water loss GPCD and the most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB. If water loss GPCD has increased from the utility's baseline to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount. Reference Table 5-6 for savings from water loss reduction.

Over (Short) – The amount that the utility's total savings from water loss reduction is over or below the volume represented by reductions in GPCD each year. If water loss reduction savings are less than these target volumes, the value will appear in parentheses.

Table 3-3. Utility Water Conservation Plan Goals — Water Loss GPCD.

Year #	Year	Utility Population	Water Loss GPCD Goals	Yearly Savings Goal with Reduction in GPCD (MG)	Total Savings from Water Loss Reduction (MG)	Over (Short) (MG)
0	Baseline	-	17.27	0	0	0
1	2015	926,624	16.67	204	(923)	(1,127)
2	2016	951,497	16.07	418	94	(324)
3	2017	976,371	15.46	644	96	(547)
4	2018	1,001,244	14.86	880	99	(781)
5-year Goal	2019	1,026,118	14.26	1,127	101	(1,026)
6	2020	1,050,991	14.20	1,177	104	(1,073)
7	2021	1,072,217	14.14	1,223	106	(1,118)
8	2022	1,093,444	14.09	1,271	108	(1,163)
9	2023	1,114,670	14.03	1,319	110	(1,209)
10-year Goal	2024	1,135,896	13.97	1,368	112	(1,256)

[14] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.

4 Implemented Activities

Below is a list of completed activities with estimated water savings. Note that drought response and other measures are not included in the utility's water savings because they are temporary, awareness-based or not able to be accurately quantified on an annual basis.

These are not savings projections of potential future activities. Estimated savings are based on measures that have actually been implemented. If savings are shown to persist in future years, it is because the measure is permanent, such as an ordinance, or the savings are assumed to continue for the reason listed under the itemized activity. Estimated savings from water rate increases are the one exception to these conditions.

Water Rate Increases

Savings from water rate increases were included because entities such as the U.S. Environmental Protection Agency and others indicate specific savings for utilities that raise rates (Texas Water Development Board, 2013; U.S. E.P.A., 1998; Whitcomb, 1999). This project includes surveys of several utilities that have minimal education efforts, perform no other substantive conservation activities, and yet experienced significant demand reduction that coincided with rate increases. In those cases, savings estimates matched up closely with decreases in total GPCD. For many smaller utilities, especially those with customers lacking disposable income, this measure is the only tool used to conserve other than water loss reduction.

The following assumptions were made for water rate increases:

- The model assumes that savings persist into future years because it is expected that the utility will continue to make periodic rate increases in line with the percentage increases from previous years.
- Only the last two rate increases for a utility were quantified.
- Savings grow with demand because as new customers enter the service area, they are assumed to adhere to the same price elasticity model estimates.
- A weighted average for savings was used when rate increases differed between residential and industrial-commercial-institutional (ICI) customers based on the individual utility's customer class breakdown.
- When a utility raised rates using tiered rate conservation pricing, a 50/50 savings split was used when increases differed between base and volumetric rates.
    - The reasoning is that all customers must react to the base increase, yet the pricing signal is stronger when volumetric rate increases affect the higher usage customers.
    - The 50/50 split is reasonable because many customers will not reach the higher volumetric tiers.
    - Studies show that most customers do not actually know they have reached the higher volumetric tiers; just that their bill has increased (Texas Water Development Board, 2013).

4.1 Itemized Activities

4.1.1 Service Area-wide and Ordinance Activities

1. **Outdoor Watering Ordinances**
    a. 2007 Peak-season restriction to twice-per-week (Austin Water, 2016)
        i. Single-family (SF) savings = 5.43 million gallons daily (MGD) or 1,981.95 MG annually by 2020
        ii. Multi-family (MF) savings = 0.99 MGD or 361.35 MG annually by 2020
        iii. Institutional-Commercial-Industrial (ICI) savings = 3.58 MGD or 1,306.7 MG annually by 2020
    b. 2012 Year-round restriction to twice-per-week (Austin Water, 2016)
        i. Additional SF savings of 0.48 MGD
        ii. 5.91 MGD total for SF customers or 2,157.15 MG annually by 2020
        iii. Total for all customer classes = 10.48 MGD or 3,825.2 MG annually by 2020
    c. 2016 Year-round restriction to once-per-week
        i. Estimated savings of 6.6% of total demand in addition to savings from year-round restriction to twice-per-week
            1. Utility staff estimated between 6.6% and 8.8% (Sierra Club-Lone Star Chapter and the National Wildlife Federation, 2015)
            2. The lower figure was quantified to be conservative
    d. All savings estimates grow each year at the same rate demand figures for the utility grow in the regional water plan.

2. **Conservation Pricing and Water Rate Increases**
    a. Tiered rate structure price increases effective in 2013 (Austin Water, 2016)
        i. SF savings = 3.7 MGD or 1,350.5 MG annually by 2020
        ii. MF savings = 2.8 MGD or 1,022 MG annually by 2020
        iii. ICI savings = 1.6 MGD or 584 MG annually by 2020
        iv. Combined savings = 8.1 MGD or 2,956.5 MG annually by 2020
        v. 2,956.5 MG annually amounts to 5.492% of demand
        vi. Savings grow with demand in future years
    b. The last two major rate increases:[15]
        i. 4.9% combined rate revenue increase in 2015
        ii. 3% combined rate revenue increase in 2016
        iii. 7.9% increase = 1.58% of total demand
    c. Estimated total demand reduction of 7.072% with tiered rate increase and two most recent rate increases
    d. Savings are cumulative and based on TWDB's Best Management Practices for Municipal Water Users Guide,[16] as well as Environmental Protection Agency guidelines and other sources (U.S. EPA, 1998; Whitcomb, 1999).

[15] Correspondence with utility staff.
[16] Water Conservation Advisory Council (WCAC) estimates 2% demand reduction with 10% increase in price on a targeted customer class. By applying a ratio, we can determine the savings for lower or higher percentage increases.

3. **Irrigation System Permits (Code)**
    a. Estimated savings of 0.49 MGD or 178.85 MG annually by 2017 (Austin Water, 2016)
        i. Code established in 2008
            1. Full savings realized in 10 years, or 2017

4. **Stormwater Landscape Ordinance (ICI)**
    a. Estimated savings of 15,744.5 gallons per day or 5.746 MG per year (Austin Water, 2016)
    b. Savings estimates grow each year at the same rate demand figures for Austin grow in the regional water plan.

5. **WaterWise Take-home Kits**
    a. Estimated savings of 7,384 gallons per year per kit (Frontier Associates, 2015)
    b. Conservative five-year useful life for all items in kit
    c. 15% adoption rate assumed

6. **Water Waste Administrative Enforcement**
    a. Utility staff estimates savings of 37.5 gallons per day during peak-season (Austin Water, 2016)
    b. 37.5 gallons per day for 150 days (5 months of peak season) = 5,625 gallons
    c. Assumed a conservative 9.375 gallons per day (25% of peak season figure) for 215 days (7 months of off-peak season) = 2,015 gallons
    d. Total of 7,640 per year per citation
    e. Savings expected to persist for 3 years after citation issued
    f. Number of citations were not separated by customer class in materials provided by staff

7. **Rainwater Harvesting Rebate**
    a. Estimated 24.61 gallons per day per rebate issued (Austin Water, 2016)
    b. 10-year useful life

8. **Dropcountr Home Water Use Reports**
    a. Not quantified for this report
        i. Lacked sufficient support material to estimate savings for monthly usage reports
        ii. Dropcountr may be able to provide specific savings estimates for its monthly program.
    b. Other customer engagement portal studies show that 20% of residential customers could save 10% of their consumption over a year's time with potential to save more as more customers engage with the portal's features (Chesnutt and Mitchell, 2013; East Bay Municipal Utility District, 2014; IBM, 2011; Texas A&M and Texas Water Resources Institute, 2016; Westin Engineering, 2015)
        i. See Section 6 for details on potential savings.

4.1.2 Single-family Residential Activities

9. Free Toilet Voucher Program

a. Estimated savings of 8,440 gallons per year per toilet for 1.6 gallons per flush Ultra-Low Flush (ULF) model (A&N Technical Services, 2005)
b. Number of vouchers per year provided by staff
c. 10-year useful life
d. Replaced by 1.28 gallons per flush model at the end of useful life
    i. Estimated 10,390 gallons per year per toilet (A&N Technical Services, 2005)

10. High Efficiency (HE) Toilet Rebate

a. Estimated 10,390 gallons per year per toilet (A&N Technical Services, 2005)
b. Savings carry on indefinitely because replacement toilet will be as efficient

11. Clothes Washer Rebate

a. Estimated 14.5 gallons per day for single-family customers or 5,293 gallons per year per washer (Austin Water, 2016)
b. 13-years useful life

12. Free Irrigation System Efficiency Evaluation

a. Estimated 205.1 gallons per day savings or 74,862 gallons per year per audit (Austin Water, 2016)
b. Savings expected to persist 3 years after evaluation

13. Irrigation Update Rebate

a. Estimated savings of 50 gallons per day or 18,250 gallons per year per rebate (GDS Associates, 2002)
b. Savings expected to last 3 years after rebate issued

14. Lawn Conversion (WaterWise) Rebate

a. Estimated savings of 59.1 gallons per day or 21,572 gallons per year per rebate (Austin Water, 2016)
b. 10-year useful life

15. Showerhead Distribution

a. Estimated 10.48 gallons per day savings or 3,825.2 gallons per year per showerhead (Austin Water, 2016)
b. 5-year useful life
    i. If distributed after 2009, plumbing code will require that replacement is equally as efficient, so savings will carry forward indefinitely

16. Bathroom/Kitchen Faucet Aerator Distribution

a. Estimated 5.43 gallons per day savings or 1,982 gallons per year per aerator (Austin Water, 2016)
b. 5-year useful life

17. Soil Moisture Monitor Distribution

a. Savings estimate not available

18. Tree Gator Distribution

a. Estimated 0.54 gallons per day savings or 391 gallons per year per Tree Gator (Austin Water, 2016)
b. 5-year useful life

19. Pool Cover Rebate

a. Estimated 21.88 gallons per day savings or 7,986 gallons per year per pool cover (Austin Water, 2016)
b. 10-year useful life

20. Hose Timer Rebate

a. Estimated 18.28 gallons per day savings or 6,672.2 gallons per year per hose timer (Austin Water, 2016)
b. 3-year useful life

21. Pressure Regulating Valve Rebate

a. Estimated 23.56 gallons per day savings or 8,600 gallons per year per valve (Austin Water, 2016)
b. 10-year useful life

4.1.3 Multi-family Residential Activities

22. Free Toilet Voucher Program

a. Estimated savings of 12,810 gallons per year per toilet for 1.6 gallons per flush ULF model (A&N Technical Services, 2005)
b. Number of vouchers per year provided by staff
c. 10-year useful life
d. Replaced by 1.28 gallons per flush model at the end of useful life
    i. Estimated 15,756 gallons per year per toilet (A&N Technical Services, 2005)

23. HE Toilet Rebate

a. Estimated 15,756 gallons per year per toilet (A&N Technical Services, 2005)
b. Savings carry on indefinitely because replacement toilet will be as efficient

24. Clothes Washer Rebate

a. Estimated 81.46 gallons per day for multi-family customers or 29,733 gallons per year per washer (Austin Water, 2016)
b. 8-year useful life

25. Lawn Conversion (WaterWise) Rebate

a. Savings estimate not available
b. Only one issued in years analyzed (2014)

26. Pressure Regulating Valve Rebate

a. Variable savings for multi-family customers
b. No rebates issued for years analyzed

27. Showerhead Distribution

a. Estimated 8.06 gallons per day savings or gallons per year per showerhead (Austin Water, 2016)
b. 5-year useful life
    i. If distributed after 2009, plumbing code will require that replacement is equally as efficient, so savings will carry forward indefinitely

28. Bathroom/Kitchen Faucet Aerator Distribution

a. Estimated 3.98 gallons per day or 1,453 gallons per year per aerator (Austin Water, 2016)
b. 5-year useful life

29. Soil Moisture Monitor Distribution

a. Savings estimate not available

30. Tree Gator Distribution

a. Savings estimate not available
b. No rebates issued for years analyzed

4.1.4 Commercial Activities

31. Free Toilet Voucher Program

a. Estimated savings of 10,580 gallons per year per toilet for 1.6 gallons per flush ULF model (A&N Technical Services, 2005)
b. Number of vouchers per year provided by staff
c. 10-year useful life
d. Replaced by 1.28 gallons per flush model at the end of useful life
    i. Estimated 13,000 gallons per year per toilet (A&N Technical Services, 2005)

32. HE Toilet Rebate

a. Estimated 13,000 gallons per year per toilet (A&N Technical Services, 2005)
b. Savings carry on indefinitely because replacement toilet will be as efficient

33. Clothes Washer Rebate

a. Estimated 81.46 gallons per day for multi-family customers or 29,733 gallons per year per washer (Austin Water, 2016)
b. 8-year useful life

34. Irrigation Controller Rebate

a. Estimated conservative savings of 11,340 gallons per year per controller

b. Used EPA WaterSense Water Budget Tool Formula[17] with 4,000 sq. ft. as basis for landscape hydrozone (U.S. EPA, 2017)
c. Number of rebates per year provided by staff
d. Savings assumed to last 10 years with no decay rate

35. Commercial Irrigation Rebate
a. Savings estimate not available
b. Minimal rebates issued

36. ICI Audit
a. Savings estimate not available
b. Minimal rebates issued

37. Commercial Kitchen Rebate
a. Variable savings
b. No rebates issued for years analyzed

38. Commercial Process Rebate
a. Variable savings
b. Minimal rebates issued

39. Mandatory Commercial Facility Irrigation Assessment
a. Conservatively estimated 500 gallons per day savings or 182,500 gallons per year per assessment (Austin Water, 2016)
b. 3-year life for each assessment

40. Mandatory Commercial Vehicle Facility Efficiency Assessment
a. Savings estimate not available

[17] $LWR_H = RTM\ [(ET_o \times K_L) - R_a] \times A \times C_u$

5 Summary of Savings

Table 5-1. Savings for Service Area-wide and Ordinance Activities (MG).

Year	Outdoor Watering Ordinances	Conservation Pricing Increases	Water Rate Increases	Irrigation System Permits	Stormwater Landscape Ordinance (ICI)	WaterWise Take-home Kits	Water Waste Violations + Inspections	Rainwater Harvesting	TOTAL SAVINGS
2010	Variable			54	6		26	23.5	109

6 Suggested Activities

Up to four activities were chosen as potential suggested activities for individual reports. These activities are: AMI system with customer portal, twice-per-week (or less) outdoor watering ordinances, strategic water rate increases, and rain barrels.

Activities were chosen because they are:

- Achievable
- Prevalence of vendors that can actually implement them
- Acceptability to city councils, MUD boards, et al.
- Easily adopted
- Cost effective
- Yield high savings relative to cost

AMI systems with customer engagement portals were also chosen because they represent a profusion of future applications that will undoubtedly continue to advance conservation efforts. AMI and meter data management (MDM) companies are developing new and innovative ways to benefit water providers, customers, and ultimately states that are pushing conservation and usage analytics further.

Each utility should be cognizant of the potential impact that these suggested activities may have on its own unique rate and revenue situation.

Benefits to consider:

- Avoided water supply and wastewater costs
    - The higher water purchase, transmission, and distribution costs are, the greater the potential benefit realized when large amounts of water are conserved with these activities.
- Avoided system expansion costs

- Conserving water may allow a utility to postpone building new system capacity by decreasing demand even as population grows.

Costs to consider:

- Staff time and resources
- Unit cost per unit saved
- Implementation costs
- Stakeholder agreement and support
- Other overhead and budget considerations

6.1 Suggested Activities with Savings Estimates

1. Advanced Metering Infrastructure with Customer Engagement Portal

These portals, along with mobile applications and billing statements, can provide customers with much more access to their water use data in simple and compelling formats. This access and comparison with other customers' usage can reduce water use through changed behavior, as well as provide an opportunity for other conservation programs to be offered to the customer for increased adoption and additional savings. AMI systems support leak notification and web portals with real-time data. Any water loss reduction savings that these systems also yield were included in the water loss assessment of individual reports for this project.

a. Specific utility results will vary based on portal features and frequency of customer notifications.
b. Potential savings estimate assumes 20% of residential customers will use and save water due to the portal (Westin Engineering, 2015)
c. Estimate assumes customers will save 10% of total annual use due to the portal
  i. Savings estimate of 10% is an average of results from multiple studies (Chesnutt and Mitchell, 2013; East Bay Municipal Utility District, 2014; IBM, 2011; Texas A&M and Texas Water Resources Institute, 2016; Westin Engineering, 2015).
d. Residential customers' use assumed to make up approximately 67% of all retail customers' use based on utility profile information submitted to the TWDB
  i. This was the most common percentage of residential use among participating utilities in this project.
  ii. Actual customer class demand percentages will vary by utility.
e. 20% of residential customers saving 10% with this customer class breakdown amounts to 1.34% of total demand
f. Savings are assumed to increase along with demand as connections increase each year.[18]

[18] The 10% consumption reduction figure for 20% of residential customers is conservative, but savings could be greater when monitored yearly as customer engagement increases.

g. See Table 6-1 for potential savings from this measure compared with the utility's WMS supply volumes targets.

Table 6-1. Current Savings + Potential Savings from AMI with Customer Portal (MG).

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Potential Savings from AMI with Customer Portal	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)

Statewide Water Conservation Quantification Project
Aqua WSC Report • 2017

1 Introduction

In Texas' 2017 State Water Plan, municipal water conservation is projected to meet 9.6 percent[1] of the state's future water needs by 2070. According to the 16 regional water plans that comprise the state water plan, this is expected to be achieved through a variety of measures such as installation of water efficient plumbing fixtures, water conservation pricing structures, water system audits, landscape irrigation ordinances, as well as other water conservation activities. The 9.6 percent is "in addition to the estimated share of future passive conservation savings from plumbing codes and water efficiency standards, which are embedded in municipal water demand projections" (Texas Water Development Board, 2017).

In 2015, the Texas Legislature appropriated funds to the Texas Water Development Board (TWDB) to fund a research project principally charged with quantitatively determining the savings of municipal water conservation activities being implemented in relation to the recommended conservation goals (supply volumes) in the State Water Plan. As part of the project, individual reports were completed for all participating utilities.

With this report, utilities will benefit by receiving a clear and concise picture of its water conservation goals alongside estimated savings from quantifiable activities. In the event that current activity savings may not be able to reach long-term goals, this report offers suggestions on how utilities can reach water conservation goals with activities that are effective, easily adopted, have widespread appeal, and are quantifiable.

2 Municipal Conservation Terminology and Review of Methodology Used by Regional Planners

To make use of the results of this study, it is important to understand several key terms used in the water planning process.

What is a water user group?

In this report, a water user group (WUG) refers to a retail water provider in the form a city, municipal utility district, water control and improvement district, special utility district, water supply corporation, fresh water supply district, or other type of water utility. The TWDB further defines WUGs as one of the following (Texas Water Development Board, 2016b):

- Cities and towns with a population of 500 or more
- Non-city utilities providing more than 280 acre-feet per year per year of water for municipal use
- Collective reporting units (CRUs) consisting of grouped utilities having a common association

[1] Equal to 811,224 acre-feet per year in conservation savings.

- County-Wide WUGs:
    - County-Other (Rural/unincorporated areas of municipal water use)
    - Manufacturing
    - Steam electric power generation

What is a recommended water management strategy?

A recommended water management strategy (WMS) is a measure that will help ensure WUGs have adequate water supplies for their end users well into the future. WMS examples include river diversions, groundwater use, reservoir and aquifer development, and irrigation conservation. When WMS is referred to in this report, it refers only to municipal conservation, which may include water loss reduction as a part of the same strategy.

What is a WMS supply volume?

A WMS supply volume is the amount of water that a given strategy is expected to yield each decade in the planning period if carried out by the WUG. In this report, a WMS supply volume is the amount of water recommended to come from municipal water conservation.

Some regional water plans separate this strategy's supply volume into a volume for municipal water conservation and a volume for water loss reduction for each decade. The total strategy supply volume is the sum of both. A regional water plan may also refer to "advanced conservation" as part of this strategy. Advanced conservation usually indicates that the volume could be achieved through a more robust mix of conservation activities described in the plan.

2.1 Regional Planning Group Approach to Determining Supply Volumes

Each regional water planning group (RWPG) is responsible for producing its own individual plan that, if executed, will provide sufficient water to its WUGs throughout a 50-year planning period. These plans are completed in five-year cycles, with the most recent edition being completed in 2016. The 2016 regional plans make up the 2017 State Water Plan, which sets out WMS supply volumes for the years 2020 through 2070.

The decadal WMS supply volumes for municipal conservation were established by each of the RWPGs in much the same manner. The RWPGs generally followed the guidelines of the Texas Legislature's Water Conservation Implementation Task Force on the pace utilities should target to reduce gallons per capita per day (GPCD)[2] consumption levels.

The targeted reductions used by most regions follow this formula:

- For municipal WUGs with water use of 140 GPCD and greater, the goal is to reduce per capita water use by one percent per year until the level of 140 GPCD is reached,

[2] Regional water planning GPCD is defined as the annual volume of water pumped, diverted, or purchased minus the volume exported (sold) to other water systems or large industrial facilities divided by the permanent resident population of the Municipal Water User Group in the regional water planning process divided by 365. Saline and reused/recycled water are not included in this volume (Texas Water Development Board, 2012).

after which, the goal is to reduce per capita water use by one-fourth percent per year for the remainder of the planning period (Texas Water Development Board, 2016j).

The yearly reductions in GPCD for a given WUG are then converted into recommended supply volumes in acre-feet per year for each decade as the reductions in consumption continue. Some regions reduce GPCD by slightly different percentages before and after the 140 GPCD threshold, some do not apply further reductions in GPCD for WUGs once they reach 140 GPCD, while others recommend only "advanced conservation" activities once WUGs meet 140 GPCD.

2.2 Methodology

In order to complete a uniform quantification process, the first engagement was with utilities that agreed to participate and collected as much relevant data as possible. These data included, among many others, historical GPCD consumption figures, advanced metering infrastructure (AMI) specifications, and detailed feedback on each conservation activity being implemented. Personal interviews focused on determining when and to what extent these activities were being employed, as well as assessing plans to continue such conservation. Examples of frequently implemented activities include tiered water rate conservation pricing, strategic water rate increases, outdoor irrigation audits and ordinances, and rain barrel distribution.

Subsequently, each utility's conservation activities were quantified through several different means, including evidence-based studies, utility field results and savings determinations, manufacturer guarantees, water loss audits, TWDB studies, and other information that assigned a savings value to the activity's implementation.

Every conservation activity studied and quantified has a gallons-per-year estimate, useful life, and decay rate (if applicable) associated with it. Some activities' savings are projected to grow as demand grows over time, while some savings are constant each year and subside once useful life has run its course. For expanded methodology and details on studies and formulas used to determine activity savings, refer to Section 6 of the State Report included as part of this document.

Once analyzed, the resulting savings estimates from each utility were compared with the recommended WMS supply volumes in its respective regional plan to determine if the savings met, exceeded, or fell short of those volumes. Individual utility savings were aggregated to compare with regional volumes, and regional savings were aggregated to compare with state volumes.

It is important to note that this report quantified activity savings—not including water loss reduction—for the WMS supply volume comparison dating back to 2012. The reason for this is, with a few exceptions, the regional planners used 2011 as the base year for establishing potential WMS supply volumes.[3] In addition, any conservation savings achieved through 2011 are assumed to be accounted for in the regional water planning GPCD for that year.[4] Thus, quantifying from 2012 and forward is the most accurate way to determine if utilities are meeting

[3] Confirmed via personal communication with Region C, H, K, and L Plan consultants.
[4] It was established with TWDB planning staff that 2011 GPCD levels were chosen because they represented the most current water use and conservation patterns at the time.

the recommended conservation volumes in the regional plans. This assumption is by no means 100 percent accurate, however. Some previously implemented activities' savings persist into future years beyond this starting point, while some activities' savings have ceased. One year's GPCD will not necessarily include all savings yielded by conservation activities that came before it, but the quantification assessment must have a starting point.

2.3 Quantifiable Savings

The key to the project being useful and reliable is that the results from year to year are measurable. Quantifying conservation activities that can be accurately measured provides greater certainty and better planning for all stakeholders.

While many utilities are engaged in a variety of conservation activities, not all can currently be properly measured. Some examples of these activities include education initiatives, website and social media engagement, and enforcement for water waste. That does not mean these measures are not essential. Education of consumers, for example, is a fundamental activity that makes all others effective, but little hard data exists to quantify the results of education alone.

In addition, the work of conservation coordinators can have a particularly significant effect on the savings of all other activities, but the specific savings attributed to that staff role is difficult to quantify.

3 Results

This report compares Aqua WSC's current water conservation activities and their quantified savings to two metrics: 1) Region K Water Plan's (Texas Water Development Board, 2016i) recommended WMS supply volumes for municipal conservation, and 2) Aqua WSC's own 5- and 10-year goals as established in its most recent water conservation plan submitted to the TWDB.

The WMS supply volumes for municipal water conservation are laid out by decade (2020 – 2070) in the regional water plans to serve as benchmarks for what each utility could achieve via that strategy during a 50-year planning period.[5]

The 5- and 10-year goals in Aqua WSC's most recent water conservation plan are established by the utility as realistic targets for reducing consumption over that timeframe. These reductions[6] are expressed in decreasing total GPCD [7] consumption and water loss GPCD.[8] [9]

[5] Some regional water plans separate this strategy volume into a volume for water conservation and a volume for water loss reduction for each decade. The total strategy volume is the sum of both.

[6] Occasionally, some utilities expect consumption to increase due to various reasons, such as an incoming industrial presence expected to raise consumption figures for the entire service area.

[7] As defined in TWDB water conservation plan annual report (Texas Water Development Board, 2016o): (Total Gallons in System ÷ Permanent Population) ÷ 365

[8] These plans also have targets for residential GPCD and water loss as a percentage (rather than GPCD), but this report does not address those goals.

[9] As defined in TWDB water conservation plan annual report (Texas Water Development Board, 2016o): (Total Water Loss ÷ Permanent Population) ÷ 365

The estimated savings in Tables 3-1 through 3-3 indicate the best information available as provided by utility staff. Some ongoing activities may not be known and are within a utility's service area are implemented on a micro-scale that may not be quantified. Individual households and businesses may be implementing conservation measures that are unknown and therefore cannot be included in the report.

Explanation of approach to assessing water loss reduction savings

Water loss reduction savings are defined as the volume of water participating utilities are realizing from their water loss mitigation efforts. For this report, this value is the difference between each individual utility's baseline[10] for water loss GPCD and its most recent water loss GPCD reported in 2015 water loss audits on file with TWDB. Savings from all water loss reduction efforts—including pipe replacements and leak repair—are assumed to be included in this comparison to a utility's baseline.

Note that because a single year (2015) value was used for comparison, it is possible that the 2015 value could be anomalous due to a number of events that may have occurred that year, such as a water main break, a particularly wet year, or a robust effort by the utility to curtail water loss. This will distort future savings figures that were carried forward in the study because water loss will inevitably increase or decrease in later years.

Ideally, using a rolling five-year average in the calculation would correct such anomalies. However, there was insufficient data to do that for every utility. The approach was to use the most complete water loss data possible, which was represented by the 2015 water loss audit. This problem will be further minimized, as continued data collection will allow five-year averages to be calculated for a majority of utilities.

In this way, water loss savings estimates are different from all other activity savings estimates in the project. Whether savings were positive or negative depended on where individual utilities established their own baselines or where their five-year average started, and what water loss GPCD value was reported in 2015.

3.1 Current Savings Compared to Conservation WMS Supply Volume (in Million Gallons) in Regional Water Plan

Table 3-1 shows the 2070 outlook for Aqua WSC with the utility's yearly recommended WMS supply volume in million gallons (MG) alongside its water savings from implemented activities, including from water loss reduction. These activities and their associated savings are covered in greater detail in Sections 4 and 5.

Starting in 2015, this table compares all quantified conservation activity and the recommended conservation WMS supply volume for the planning period. The following definitions pair with the column headers in Table 3-1.

Actual Current Conservation Activity Savings – All quantified activities currently being

[10] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.

performed by the utility, *excluding* savings from water loss reduction. The regional planners used 2011 GPCD as the baseline for determining future conservation WMS supply volumes, therefore the study quantifies utility savings starting in 2012 for this comparison. The summary of these savings can be referenced in Table 5-1.

<u>Actual Water Loss Reduction Savings (as of 2015)</u> – The difference between the baseline[11] for water loss GPCD and most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB. [12] The summary of these savings can be referenced in Table 5-2.

<u>Total Savings from All Conservation Activity</u> – Actual Current Conservation Activity Savings plus Actual Water Loss Reduction Savings (as of 2015).

<u>Conservation WMS Volume</u> – The recommended municipal water conservation supply volume in the regional plan for the decades ranging from 2020 to 2070. These volumes are converted to MG from the values listed in the plan in acre-feet and then calculated in annual increments.

<u>Water Loss Reduction WMS Volume</u> – Some regional water plans have a separate WMS volume for water conservation and for water loss reduction for each decade. If a WUG's regional plan has a WMS volume for water loss reduction, this column will have values other than zero.

<u>Total Yearly WMS Volume</u> – The sum of the Conservation WMS Volume and Water Loss Reduction WMS Volume.

<u>Over (Short)</u> – The amount that the utility's Total Savings from All Conservation Activity (since 2012), is over or below the Total Yearly WMS Volume in the regional water plan. If the amount falls below the WMS volume, it will appear in parentheses.

[11] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.
[12] If water loss GPCD has increased from the utility's baseline or historic five-year average to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount.

Table 3-1. Current Savings Compared to Conservation WMS Supply Volume (MG) in Regional Water Plan.

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)
2015	72	(119)	(47)	102	0	102	(149)
2016	74	(120)	(46)	127	0	127	(173)

2066	261	(446)	(185)	628	0	628	(813)
2067	268	(458)	(191)	645	0	645	(836)
2068	274	(471)	(196)	661	0	661	(858)
2069	281	(483)	(202)	678	0	678	(880)
2070	288	(495)	(208)	694	0	694	(902)

3.2 Utility Water Conservation Plan Goals – Total GPCD

Table 3-2 shows how Aqua WSC's quantified savings from its implemented activities compare with 5- and 10-year goals established in its individual water conservation plan submitted to the TWDB. The following definitions pair with the column headers in Table 3-2.

Utility Population – Estimated utility service area population for the years indicated.

Total GPCD Goals – Total GPCD goals start with the utility's baseline[13] for total GPCD and progress in subsequent years to match 5- and 10-year goals indicated in a utility's five-year water conservation plan on file with the TWDB. The first five annual GPCD goals were developed by spreading the difference between the baseline and five-year goal evenly over five years. The second five annual GPCD goals spread the difference between the five-year goal and 10-year goal evenly over the next five years.

Annual Savings Goal with Reduction in GPCD (MG) – This column shows what reductions from the baseline GPCD would yield in terms of volume each year as more water is saved. The volumes indicated here are what target GPCD goals look like expressed in million gallons. Annual volumes were derived using the formula: (baseline total GPCD – target total GPCD for that year) x 365 days ÷ 1,000,000 gallons.

Total Savings for All Current Quantified Activities (MG) – Total quantified savings for all current conservation activities and savings from water loss reduction. Refer to Tables 5-1 and 5-2 for details on these savings.

Over (Short) – The amount that the utility's total quantified savings for all current conservation activities (since 2012), including water loss reduction, is over or below the volume represented by reductions in GPCD each year. If the quantified savings are less than these target volumes, the value will appear in parentheses.

Table 3-2. Utility Water Conservation Plan Goals — Total GPCD.

Year #	Year	Utility Population	Total GPCD Goals	Annual Savings Goal with Reduction in GPCD (MG)	Total Savings for All Current Quantified Activities (MG)	Over (Short) (MG)
0	**Baseline**	-	132	0	1	1
1	2015	54,500	130	32	(47)	(79)
2	2016	54,839	129	64	(46)	(110)
3	2017	55,178	127	97	(44)	(141)
4	2018	55,516	126	130	(43)	(173)
5-year Goal	2019	55,855	124	163	(41)	(205)
6	2020	56,194	124	172	(40)	(212)
7	2021	57,964	123	186	(42)	(228)
8	2022	59,734	123	201	(44)	(244)
9	2023	61,503	122	216	(45)	(261)
10-year Goal	2024	63,273	122	231	(47)	(278)

[13] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for total GPCD from the utility's most recently submitted five-year water conservation plan was used.

3.3 Utility Water Conservation Plan Goals – Water Loss GPCD

Table 3-3 shows how Aqua WSC's most recent water loss audit compares with 5- and 10-year water loss goals in its water conservation plan. The following definitions pair with the column headers in Table 3-2.

Utility Population – Estimated utility service area population for the years indicated.

Water Loss GPCD Goals – Water loss GPCD goals start with the utility's baseline[14] for water loss GPCD and progress in subsequent years to match 5- and 10-year water loss goals indicated in a utility's five-year water conservation plan on file with the TWDB. The first five annual GPCD goals were developed by spreading the difference between the baseline and five-year goal evenly over five years. The second five annual GPCD goals spread the difference between the five-year goal and 10-year goal evenly over the next five years.

Yearly Savings Goal with Reduction in GPCD (MG) – This column shows what reductions from the baseline water loss GPCD would yield in terms of volume each year as more water is saved. The volumes indicated here are what target water loss GPCD goals look like expressed in million gallons. Annual volumes were derived using the formula: (baseline water loss GPCD – target water loss GPCD for that year) x 365 days ÷ 1,000,000 gallons.

Total Savings from Water Loss Reduction (MG) – The difference between a utility's established baseline for water loss GPCD and the most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB. If water loss GPCD has increased from the utility's baseline to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount. Reference Table 5-2 for savings from water loss reduction.

Over (Short) – The amount that the utility's total savings from water loss reduction is over or below the volume represented by reductions in GPCD each year. If water loss reduction savings are less than these target volumes, the value will appear in parentheses.

Table 3-3. Utility Water Conservation Plan Goals — Water Loss GPCD.

Year #	Year	Utility Population	Water Loss GPCD Goals	Yearly Savings Goal with Reduction in GPCD (MG)	Total Savings from Water Loss Reduction (MG)	Over (Short) (MG)
0	**Baseline**	-	25.00	0	0	0
1	2015	54,500	24.40	12	(119)	(131)
2	2016	54,839	23.80	24	(120)	(144)
3	2017	55,178	23.20	36	(121)	(157)
4	2018	55,516	22.60	49	(122)	(170)
5-year Goal	2019	55,855	22.00	61	(122)	(183)
6	2020	56,194	21.40	74	(123)	(197)
7	2021	57,964	20.80	89	(127)	(216)
8	2022	59,734	20.20	105	(131)	(235)
9	2023	61,503	19.60	121	(135)	(256)
10-year Goal	2024	63,273	19.00	139	(139)	(277)

[14] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.

4 Implemented Activities

Below is a list of completed activities with estimated water savings. Note that drought response and other measures are not included in the utility's water savings because they are temporary, awareness-based or not able to be accurately quantified on an annual basis.

These are not savings projections of potential future activities. Estimated savings are based on measures that have actually been implemented. If savings are shown to persist in future years, it is because the measure is permanent, such as an ordinance, or the savings are assumed to continue for the reason listed under the itemized activity. Estimated savings from water rate increases are the one exception to these conditions.

Water Rate Increases

Savings from water rate increases were included because entities such as the U.S. Environmental Protection Agency and others indicate specific savings for utilities that raise rates (Texas Water Development Board, 2013; U.S. E.P.A., 1998; Whitcomb, 1999). This project includes surveys of several utilities that have minimal education efforts, perform no other substantive conservation activities, and yet experienced significant demand reduction that coincided with rate increases. In those cases, savings estimates matched up closely with decreases in total GPCD. For many smaller utilities, especially those with customers lacking disposable income, this measure is the only tool used to conserve other than water loss reduction.

The following assumptions were made for water rate increases:

- The model assumes that savings persist into future years because it is expected that the utility will continue to make periodic rate increases in line with the percentage increases from previous years.
- Only the last two rate increases for a utility were quantified.
- Savings grow with demand because as new customers enter the service area, they are assumed to adhere to the same price elasticity model estimates.
- A weighted average for savings was used when rate increases differed between residential and industrial-commercial-institutional (ICI) customers based on the individual utility's customer class breakdown.
- When a utility raised rates using tiered rate conservation pricing, a 50/50 savings split was used when increases differed between base and volumetric rates.
    - The reasoning is that all customers must react to the base increase, yet the pricing signal is stronger when volumetric rate increases affect the higher usage customers.
    - The 50/50 split is reasonable because many customers will not reach the higher volumetric tiers.
    - Studies show that most customers do not actually know they have reached the higher volumetric tiers; just that their bill has increased (Texas Water Development Board, 2013).

4.1 Itemized Activities

1. **Utility Website**
    a. Easy-to-use website with conservation tips and water rates
    b. Features contact information for Public Works staff and customer service

2. **Continuing Public Education**
    a. The utility engages the public in many ways including:
        i. Brochures, bill messages, displays, and exhibits

3. **Water Loss Reduction Savings**[15]
    a. Loss of 119 MG annually in 2015
    b. Water loss reduction savings = the difference between a utility's baseline[16] water loss GPCD submitted in its most recent 5-year water conservation plan and its most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB
    c. If water loss GPCD has increased from the utility's baseline or historic 5-year average to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount.
    d. All savings estimates grow each year at the same rate population figures for the utility grow in the regional water plan.

4. **Water Rate Increases**
    a. Last rate increases:[17]
        i. 10.0% increase in 2011
        ii. 1.5% increase in 2014
    b. Estimated customer demand reduction of 2.3%
    c. Savings is cumulative and based on more than one source[18] (U.S. EPA, 1998; Whitcomb, 1999)
    d. Savings from rate increases are shown to persist over time, however, note that savings from these pricing signals will likely decrease if rates remain the same in future year.

[15] If current water loss levels exceed a utility's baseline, this value is treated as a deduction from total quantified savings.
[16] In the absence of having a baseline figure provided in the utility's most recently submitted 5-year water conservation plan, the historic 5-year average for water loss GPCD in the plan was used.
[17] Correspondence with utility staff.
[18] The study estimates a 2% demand reduction with 10% increase in price on a targeted customer class. By applying a ratio, it is possible to determine the savings for lower or higher percentage increases.

5 Summary of Savings

Table 5-1. Savings by Water Conservation Activity (MG).

Year	Water Rate Increases	TOTAL SAVINGS
2009		0
2010		0
2011	63.8	64
2012	65.9	66
2013	68.1	68
2014	70.2	70
2015	72.3	72
2016	74.5	74
2017	76.6	77
2018	78.7	79
2019	80.9	81
2020	83.0	83
2021	85.1	85
2022	87.3	87

2066	260.8	261
2067	267.5	268
2068	274.2	274
2069	280.9	281
2070	287.6	288

Table 5-2. Savings from Water Loss Reduction (MG).

Year	Utility Population	Water Loss GPCD	Total Savings from Water Loss Reduction
Baseline	-	25.00	0
2015	54,500	31.00	(119)
2016	54,839	31.00	(120)
2017	55,178	31.00	(121)
2018	55,516	31.00	(122)
2019	55,855	31.00	(122)
2020	56,194	31.00	(123)
2021	57,964	31.00	(127)
2022	59,734	31.00	(131)
2023	61,503	31.00	(135)
2024	63,273	31.00	(139)

6 Suggested Activities

Up to four activities were chosen as potential suggested activities for individual reports. These activities are: AMI system with customer portal, twice-per-week (or less) outdoor watering ordinances, strategic water rate increases, and rain barrels.

Activities were chosen because they are:

- Achievable
- Prevalence of vendors that can actually implement them
- Acceptability to city councils, MUD boards, et al.
- Easily adopted
- Cost effective
- Yield high savings relative to cost

AMI systems with customer engagement portals were also chosen because they represent a profusion of future applications that will undoubtedly continue to advance conservation efforts. AMI and meter data management (MDM) companies are developing new and innovative ways to benefit water providers, customers, and ultimately states that are pushing conservation and usage analytics further.

Each utility should be cognizant of the potential impact that these suggested activities may have on its own unique rate and revenue situation.

Benefits to consider:

- Avoided water supply and wastewater costs
    - The higher water purchase, transmission, and distribution costs are, the greater the potential benefit realized when large amounts of water are conserved with these activities.
- Avoided system expansion costs
    - Conserving water may allow a utility to postpone building new system capacity by decreasing demand even as population grows.

Costs to consider:

- Staff time and resources
- Unit cost per unit saved
- Implementation costs
- Stakeholder agreement and support
- Other overhead and budget considerations

6.1 Suggested Activities with Savings Estimates

1. Twice-a-week Outdoor Watering Restriction Ordinance
    a. Potentially 6.53% savings of total demand (Hermitte and Mace, 2012; Sierra Club-Lone Star Chapter and National Wildlife Federation, 2015)
        i. Average Region K savings
        ii. Specific percentage of outdoor usage unknown for your utility at this time
    b. Savings could be 211 MG per year with current demand.
    c. See Table 6-1 for potential savings from this measure compared with the city's WMS supply volumes targets.

Table 6-1. Current Savings + Potential Savings from 2x per Week Watering Ordinance (MG).

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Potential Savings from Ordinance	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)
2016	74	(120)	(46)	211	127	0	127	38
2017	77	(121)	(44)	217	127	0	127	46
2018	79	(122)	(43)	224	153	0	153	28
2019	81	(122)	(41)	230	178	0	178	10
2020	83	(123)	(40)	236	229	0	229	(34)
2021	85	(127)	(42)	242	239	0	239	(39)
2022	87	(131)	(44)	248	249	0	249	(45)

2. Advanced Metering Infrastructure with Customer Engagement Portal

These portals, along with mobile applications and billing statements, can provide customers with much more access to their water use data in simple and compelling formats. This access and comparison with other customers' usage can reduce water use through changed behavior, as well as provide an opportunity for other conservation programs to be offered to the customer for increased adoption and additional savings. AMI systems support leak notification and web portals with real-time data. Any water loss reduction savings that these systems also yield were included in the water loss assessment of individual reports for this project.

- **a.** Specific utility results will vary based on portal features and frequency of customer notifications
- **b.** Potential savings estimate assumes 20% of residential customers will use and save water due to the portal (Westin Engineering, 2015)
- **c.** Estimate assumes customers will save 10% of total annual use due to the portal
    - i. Savings estimate of 10% is an average of results from multiple studies (Chesnutt and Mitchell, 2013; East Bay Municipal Utility District, 2014; IBM, 2011; Texas A&M and Texas Water Resources Institute, 2016; Westin Engineering, 2015)
- **d.** Residential customers' use assumed to make up approximately 67% of all retail customers' use based on utility profile information submitted to the TWDB
    - i. This was the most common percentage of residential use among participating utilities in this project.
    - ii. Actual customer class demand percentages will vary by utility.
- **e.** 20% of residential customers saving 10% with this customer class breakdown amounts to 1.34% of total demand
- **f.** Savings are assumed to increase along with demand as connections increase each year[19]
- **g.** See Table 6-2 for potential savings from this measure compared with the utility's WMS supply volumes targets.

[19] The 10% consumption reduction figure for 20% of residential customers is conservative, but savings could be greater when monitored yearly as customer engagement increases.

Table 6-2. Current Savings + Potential Savings from AMI with Customer Portal (MG).

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Potential Savings from AMI with Customer Portal	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)

3. Rain Barrels
    a. In Region K, utilities could save approximately 22.4 gallons per year per gallon of capacity rebated, sold, or distributed (GDS Associates, 2002).
    b. Estimated 10-year useful life for most barrels

Statewide Water Conservation Quantification Project
City of Horseshoe Bay Report • 2017

1 Introduction

In Texas' 2017 State Water Plan, municipal water conservation is projected to meet 9.6 percent[1] of the state's future water needs by 2070. According to the 16 regional water plans that comprise the state water plan, this is expected to be achieved through a variety of measures such as installation of water efficient plumbing fixtures, water conservation pricing structures, water system audits, landscape irrigation ordinances, as well as other water conservation activities. The 9.6 percent is "in addition to the estimated share of future passive conservation savings from plumbing codes and water efficiency standards, which are embedded in municipal water demand projections" (Texas Water Development Board, 2017).

In 2015, the Texas Legislature appropriated funds to the Texas Water Development Board (TWDB) to fund a research project principally charged with quantitatively determining the savings of municipal water conservation activities being implemented in relation to the recommended conservation goals (supply volumes) in the State Water Plan. As part of the project, individual reports were completed for all participating utilities.

With this report, utilities will benefit by receiving a clear and concise picture of its water conservation goals alongside estimated savings from quantifiable activities. In the event that current activity savings may not be able to reach long-term goals, this report offers suggestions on how utilities can reach water conservation goals with activities that are effective, easily adopted, have widespread appeal, and are quantifiable.

2 Municipal Conservation Terminology and Review of Methodology Used by Regional Planners

To make use of the results of this study, it is important to understand several key terms used in the water planning process.

What is a water user group?

In this report, a water user group (WUG) refers to a retail water provider in the form a city, municipal utility district, water control and improvement district, special utility district, water supply corporation, fresh water supply district, or other type of water utility. The TWDB further defines WUGs as one of the following (Texas Water Development Board, 2016b):

- Cities and towns with a population of 500 or more
- Non-city utilities providing more than 280 acre-feet per year per year of water for municipal use
- Collective reporting units (CRUs) consisting of grouped utilities having a common association

[1] Equal to 811,224 acre-feet per year in conservation savings.

- County-Wide WUGs:
  - County-Other (Rural/unincorporated areas of municipal water use)
  - Manufacturing
  - Steam electric power generation

What is a recommended water management strategy?

A recommended water management strategy (WMS) is a measure that will help ensure WUGs have adequate water supplies for their end users well into the future. WMS examples include river diversions, groundwater use, reservoir and aquifer development, and irrigation conservation. When WMS is referred to in this report, it refers only to municipal conservation, which may include water loss reduction as a part of the same strategy.

What is a WMS supply volume?

A WMS supply volume is the amount of water that a given strategy is expected to yield each decade in the planning period if carried out by the WUG. In this report, a WMS supply volume is the amount of water recommended to come from municipal water conservation.

Some regional water plans separate this strategy's supply volume into a volume for municipal water conservation and a volume for water loss reduction for each decade. The total strategy supply volume is the sum of both. A regional water plan may also refer to "advanced conservation" as part of this strategy. Advanced conservation usually indicates that the volume could be achieved through a more robust mix of conservation activities described in the plan.

2.1 Regional Planning Group Approach to Determining Supply Volumes

Each regional water planning group (RWPG) is responsible for producing its own individual plan that, if executed, will provide sufficient water to its WUGs throughout a 50-year planning period. These plans are completed in five-year cycles, with the most recent edition being completed in 2016. The 2016 regional plans make up the 2017 State Water Plan, which sets out WMS supply volumes for the years 2020 through 2070.

The decadal WMS supply volumes for municipal conservation were established by each of the RWPGs in much the same manner. The RWPGs generally followed the guidelines of the Texas Legislature's Water Conservation Implementation Task Force on the pace utilities should target to reduce gallons per capita per day (GPCD)[2] consumption levels.

The targeted reductions used by most regions follow this formula:

- For municipal WUGs with water use of 140 GPCD and greater, the goal is to reduce per capita water use by one percent per year until the level of 140 GPCD is reached,

[2] Regional water planning GPCD is defined as the annual volume of water pumped, diverted, or purchased minus the volume exported (sold) to other water systems or large industrial facilities divided by the permanent resident population of the Municipal Water User Group in the regional water planning process divided by 365. Saline and reused/recycled water are not included in this volume (Texas Water Development Board, 2012).

after which, the goal is to reduce per capita water use by one-fourth percent per year for the remainder of the planning period (Texas Water Development Board, 2016j).

The yearly reductions in GPCD for a given WUG are then converted into recommended supply volumes in acre-feet per year for each decade as the reductions in consumption continue. Some regions reduce GPCD by slightly different percentages before and after the 140 GPCD threshold, some do not apply further reductions in GPCD for WUGs once they reach 140 GPCD, while others recommend only "advanced conservation" activities once WUGs meet 140 GPCD.

2.2 Methodology

In order to complete a uniform quantification process, the first engagement was with utilities that agreed to participate and collected as much relevant data as possible. These data included, among many others, historical GPCD consumption figures, advanced metering infrastructure (AMI) specifications, and detailed feedback on each conservation activity being implemented. Personal interviews focused on determining when and to what extent these activities were being employed, as well as assessing plans to continue such conservation. Examples of frequently implemented activities include tiered water rate conservation pricing, strategic water rate increases, outdoor irrigation audits and ordinances, and rain barrel distribution.

Subsequently, each utility's conservation activities were quantified through several different means, including evidence-based studies, utility field results and savings determinations, manufacturer guarantees, water loss audits, TWDB studies, and other information that assigned a savings value to the activity's implementation.

Every conservation activity studied and quantified has a gallons-per-year estimate, useful life, and decay rate (if applicable) associated with it. Some activities' savings are projected to grow as demand grows over time, while some savings are constant each year and subside once useful life has run its course. For expanded methodology and details on studies and formulas used to determine activity savings, refer to Section 6 of the State Report included as part of this document.

Once analyzed, the resulting savings estimates from each utility were compared with the recommended WMS supply volumes in its respective regional plan to determine if the savings met, exceeded, or fell short of those volumes. Individual utility savings were aggregated to compare with regional volumes, and regional savings were aggregated to compare with state volumes.

It is important to note that this report quantified activity savings—not including water loss reduction—for the WMS supply volume comparison dating back to 2012. The reason for this is, with a few exceptions, the regional planners used 2011 as the base year for establishing potential WMS supply volumes.[3] In addition, any conservation savings achieved through 2011 are assumed to be accounted for in the regional water planning GPCD for that year.[4] Thus, quantifying from 2012 and forward is the most accurate way to determine if utilities are meeting

[3] Confirmed via personal communication with Region C, H, K, and L Plan consultants.
[4] It was established with TWDB planning staff that 2011 GPCD levels were chosen because they represented the most current water use and conservation patterns at the time.

the recommended conservation volumes in the regional plans. This assumption is by no means 100 percent accurate, however. Some previously implemented activities' savings persist into future years beyond this starting point, while some activities' savings have ceased. One year's GPCD will not necessarily include all savings yielded by conservation activities that came before it, but the quantification assessment must have a starting point.

2.3 Quantifiable Savings

The key to the project being useful and reliable is that the results from year to year are measurable. Quantifying conservation activities that can be accurately measured provides greater certainty and better planning for all stakeholders.

While many utilities are engaged in a variety of conservation activities, not all can currently be properly measured. Some examples of these activities include education initiatives, website and social media engagement, and enforcement for water waste. That does not mean these measures are not essential. Education of consumers, for example, is a fundamental activity that makes all others effective, but little hard data exists to quantify the results of education alone.

In addition, the work of conservation coordinators can have a particularly significant effect on the savings of all other activities, but the specific savings attributed to that staff role is difficult to quantify.

3 Results

This report compares Horseshoe Bay's current water conservation activities and their quantified savings to two metrics: 1) Region K Water Plan's (Texas Water Development Board, 2016i) recommended WMS supply volumes for municipal conservation, and 2) Horseshoe Bay's own 5- and 10-year goals as established in its most recent water conservation plan submitted to the TWDB.

The WMS supply volumes for municipal water conservation are laid out by decade (2020 – 2070) in the regional water plans to serve as benchmarks for what each utility could achieve via that strategy during a 50-year planning period.[5]

The 5- and 10-year goals in Horseshoe Bay's most recent water conservation plan are established by the utility as realistic targets for reducing consumption over that timeframe. These reductions[6] are expressed in decreasing total GPCD [7] consumption and water loss GPCD.[8] [9]

---

[5] Some regional water plans separate this strategy volume into a volume for water conservation and a volume for water loss reduction for each decade. The total strategy volume is the sum of both.

[6] Occasionally, some utilities expect consumption to increase due to various reasons, such as an incoming industrial presence expected to raise consumption figures for the entire service area.

[7] As defined in TWDB water conservation plan annual report (Texas Water Development Board, 2016o): (Total Gallons in System ÷ Permanent Population) ÷ 365

[8] These plans also have targets for residential GPCD and water loss as a percentage (rather than GPCD), but this report does not address those goals.

[9] As defined in TWDB water conservation plan annual report (Texas Water Development Board, 2016o): (Total Water Loss ÷ Permanent Population) ÷ 365

The estimated savings in Tables 3-1 through 3-3 indicate the best information available as provided by utility staff. Some ongoing activities may not be known and are within a utility's service area are implemented on a micro-scale that may not be quantified. Individual households and businesses may be implementing conservation measures that are unknown and therefore cannot be included in the report.

Explanation of approach to assessing water loss reduction savings

Water loss reduction savings are defined as the volume of water participating utilities are realizing from their water loss mitigation efforts. For this report, this value is the difference between each individual utility's baseline[10] for water loss GPCD and its most recent water loss GPCD reported in 2015 water loss audits on file with TWDB. Savings from all water loss reduction efforts—including pipe replacements and leak repair—are assumed to be included in this comparison to a utility's baseline.

Note that because a single year (2015) value was used for comparison, it is possible that the 2015 value could be anomalous due to a number of events that may have occurred that year, such as a water main break, a particularly wet year, or a robust effort by the utility to curtail water loss. This will distort future savings figures that were carried forward in the study because water loss will inevitably increase or decrease in later years.

Ideally, using a rolling five-year average in the calculation would correct such anomalies. However, there was insufficient data to do that for every utility. The approach was to use the most complete water loss data possible, which was represented by the 2015 water loss audit. This problem will be further minimized, as continued data collection will allow five-year averages to be calculated for a majority of utilities.

In this way, water loss savings estimates are different from all other activity savings estimates in the project. Whether savings were positive or negative depended on where individual utilities established their own baselines or where their five-year average started, and what water loss GPCD value was reported in 2015.

3.1 Current Savings Compared to Conservation WMS Supply Volume (in Million Gallons) in Regional Water Plan

Table 3-1 shows the 2070 outlook for Horseshoe Bay with the utility's yearly recommended WMS supply volume in million gallons (MG) alongside its water savings from implemented activities, including from water loss reduction. These activities and their associated savings are covered in greater detail in Sections 4 and 5.

Starting in 2015, this table compares all quantified conservation activity and the recommended conservation WMS supply volume for the planning period. The following definitions pair with the column headers in Table 3-1.

<u>Actual Current Conservation Activity Savings</u> – All quantified activities currently being

[10] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.

performed by the utility, *excluding* savings from water loss reduction. The regional planners used 2011 GPCD as the baseline for determining future conservation WMS supply volumes, therefore the study quantifies utility savings starting in 2012 for this comparison. The summary of these savings can be referenced in Table 5-1.

Actual Water Loss Reduction Savings (as of 2015) – The difference between the baseline[11] for water loss GPCD and most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB. [12] The summary of these savings can be referenced in Table 5-2.

Total Savings from All Conservation Activity – Actual Current Conservation Activity Savings plus Actual Water Loss Reduction Savings (as of 2015).

Conservation WMS Volume – The recommended municipal water conservation supply volume in the regional plan for the decades ranging from 2020 to 2070. These volumes are converted to MG from the values listed in the plan in acre-feet and then calculated in annual increments.

Water Loss Reduction WMS Volume – Some regional water plans have a separate WMS volume for water conservation and for water loss reduction for each decade. If a WUG's regional plan has a WMS volume for water loss reduction, this column will have values other than zero.

Total Yearly WMS Volume – The sum of the Conservation WMS Volume and Water Loss Reduction WMS Volume.

Over (Short) – The amount that the utility's Total Savings from All Conservation Activity (since 2012), is over or below the Total Yearly WMS Volume in the regional water plan. If the amount falls below the WMS volume, it will appear in parentheses.

[11] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.
[12] If water loss GPCD has increased from the utility's baseline or historic five-year average to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount.

Table 3-1. Current Savings Compared to Conservation WMS Supply Volume (MG) in Regional Water Plan.

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)

3.2 Utility Water Conservation Plan Goals – Total GPCD

Table 3-2 shows how Horseshoe Bay's quantified savings from its implemented activities compare with 5- and 10-year goals established in its individual water conservation plan submitted to the TWDB. The following definitions pair with the column headers in Table 3-2.

Utility Population – Estimated utility service area population for the years indicated.

Total GPCD Goals – Total GPCD goals start with the utility's baseline[13] for total GPCD and progress in subsequent years to match 5- and 10-year goals indicated in a utility's five-year water conservation plan on file with the TWDB. The first five annual GPCD goals were developed by spreading the difference between the baseline and five-year goal evenly over five years. The second five annual GPCD goals spread the difference between the five-year goal and 10-year goal evenly over the next five years.

Annual Savings Goal with Reduction in GPCD (MG) – This column shows what reductions from the baseline GPCD would yield in terms of volume each year as more water is saved. The volumes indicated here are what target GPCD goals look like expressed in million gallons. Annual volumes were derived using the formula: (baseline total GPCD – target total GPCD for that year) x 365 days ÷ 1,000,000 gallons.

Total Savings for All Current Quantified Activities (MG) – Total quantified savings for all current conservation activities and savings from water loss reduction. Refer to Tables 5-1 and 5-2 for details on these savings.

Over (Short) – The amount that the utility's total quantified savings for all current conservation activities (since 2012), including water loss reduction, is over or below the volume represented by reductions in GPCD each year. If the quantified savings are less than these target volumes, the value will appear in parentheses.

Table 3-2. Utility Water Conservation Plan Goals — Total GPCD.

Year #	Year	Utility Population	Total GPCD Goals	Annual Savings Goal with Reduction in GPCD (MG)	Total Savings for All Current Quantified Activities (MG)	Over (Short) (MG)
0	**Baseline**	-	217	0	0	0
1	2015	7,589	210	19	72	52
2	2016	7,747	203	40	101	61
3	2017	7,905	196	61	102	41
4	2018	8,062	189	82	103	20
5-year Goal	2019	8,220	182	105	104	(1)
6	2020	8,378	180	112	105	(7)
7	2021	8,666	179	121	107	(14)
8	2022	8,954	177	130	108	(22)
9	2023	9,243	176	140	110	(30)
10-year Goal	2024	9,531	174	150	111	(38)

[13] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for total GPCD from the utility's most recently submitted five-year water conservation plan was used.

3.3 Utility Water Conservation Plan Goals – Water Loss GPCD

Table 3-3 shows how Horseshoe Bay's most recent water loss audit compares with 5- and 10-year water loss goals in its water conservation plan. The following definitions pair with the column headers in Table 3-2.

Utility Population – Estimated utility service area population for the years indicated.

Water Loss GPCD Goals – Water loss GPCD goals start with the utility's baseline[14] for water loss GPCD and progress in subsequent years to match 5- and 10-year water loss goals indicated in a utility's five-year water conservation plan on file with the TWDB. The first five annual GPCD goals were developed by spreading the difference between the baseline and five-year goal evenly over five years. The second five annual GPCD goals spread the difference between the five-year goal and 10-year goal evenly over the next five years.

Yearly Savings Goal with Reduction in GPCD (MG) – This column shows what reductions from the baseline water loss GPCD would yield in terms of volume each year as more water is saved. The volumes indicated here are what target water loss GPCD goals look like expressed in million gallons. Annual volumes were derived using the formula: (baseline water loss GPCD – target water loss GPCD for that year) x 365 days ÷ 1,000,000 gallons.

Total Savings from Water Loss Reduction (MG) – The difference between a utility's established baseline for water loss GPCD and the most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB. If water loss GPCD has increased from the utility's baseline to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount. Reference Table 5-2 for savings from water loss reduction.

Over (Short) – The amount that the utility's total savings from water loss reduction is over or below the volume represented by reductions in GPCD each year. If water loss reduction savings are less than these target volumes, the value will appear in parentheses.

Table 3-3. Utility Water Conservation Plan Goals — Water Loss GPCD.

Year #	Year	Utility Population	Water Loss GPCD Goals	Yearly Savings Goal with Reduction in GPCD (MG)	Total Savings from Water Loss Reduction (MG)	Over (Short) (MG)
0	**Baseline**	-	15.00	0	0	0
1	2015	7,589	14.40	2	19	18
2	2016	7,747	13.80	3	20	16
3	2017	7,905	13.20	5	20	15
4	2018	8,062	12.60	7	21	14
5-year Goal	2019	8,220	12.00	9	21	12
6	2020	8,378	11.60	10	21	11
7	2021	8,666	11.20	12	22	10
8	2022	8,954	10.80	14	23	9
9	2023	9,243	10.40	16	24	8
10-year Goal	2024	9,531	10.00	17	24	7

[14] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.

4 Implemented Activities

Below is a list of completed activities with estimated water savings. Note that drought response and other measures are not included in the utility's water savings because they are temporary, awareness-based or not able to be accurately quantified on an annual basis.

These are not savings projections of potential future activities. Estimated savings are based on measures that have actually been implemented. If savings are shown to persist in future years, it is because the measure is permanent, such as an ordinance, or the savings are assumed to continue for the reason listed under the itemized activity. Estimated savings from water rate increases are the one exception to these conditions.

Water Rate Increases

Savings from water rate increases were included because entities such as the U.S. Environmental Protection Agency and others indicate specific savings for utilities that raise rates (Texas Water Development Board, 2013; U.S. E.P.A., 1998; Whitcomb, 1999). This project includes surveys of several utilities that have minimal education efforts, perform no other substantive conservation activities, and yet experienced significant demand reduction that coincided with rate increases. In those cases, savings estimates matched up closely with decreases in total GPCD. For many smaller utilities, especially those with customers lacking disposable income, this measure is the only tool used to conserve other than water loss reduction.

The following assumptions were made for water rate increases:

- The model assumes that savings persist into future years because it is expected that the utility will continue to make periodic rate increases in line with the percentage increases from previous years.
- Only the last two rate increases for a utility were quantified.
- Savings grow with demand because as new customers enter the service area, they are assumed to adhere to the same price elasticity model estimates.
- A weighted average for savings was used when rate increases differed between residential and industrial-commercial-institutional (ICI) customers based on the individual utility's customer class breakdown.
- When a utility raised rates using tiered rate conservation pricing, a 50/50 savings split was used when increases differed between base and volumetric rates.
    - The reasoning is that all customers must react to the base increase, yet the pricing signal is stronger when volumetric rate increases affect the higher usage customers.
    - The 50/50 split is reasonable because many customers will not reach the higher volumetric tiers.
    - Studies show that most customers do not actually know they have reached the higher volumetric tiers; just that their bill has increased (Texas Water Development Board, 2013).

4.1 Itemized Activities

1. **Utility Website**
    a. Easy-to-use website with conservation tips and water rates
    b. Features contact information for Public Works staff and customer service

2. **Continuing Public Education**
    a. The utility engages the public in many ways including:
        i. Brochures, bill messages, displays, and exhibits

3. **Water Loss Reduction Savings**[15]
    a. Savings of 19 MG annually in 2015
    b. Water loss reduction savings = the difference between a utility's baseline[16] water loss GPCD submitted in its most recent 5-year water conservation plan and its most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB
    c. If water loss GPCD has increased from the utility's baseline or historic 5-year average to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount.
    d. All savings estimates grow each year at the same rate population figures for the utility grow in the regional water plan.

4. **Water Rate Increases**
    a. Last rate increases:[17]
        i. 1.8% increase in 2015
        ii. 4.9% increase in 2016
    b. Estimated customer demand reduction of 1.35%
    c. Savings are cumulative and based on more than one source[18] (U.S. EPA, 1998; Whitcomb, 1999)
    d. Savings from rate increases are shown to persist over time, however, note that savings from these pricing signals will likely decrease if rates remain the same in future years.

5. **Automatic Meter Reading (AMR)/Advanced Metering Infrastructure (AMI)**
    a. These metering systems can save water in a number of ways, including from water loss reduction through improved leak detection.
    b. All water loss reduction savings associated with this activity are detailed in Section 5, which assessed utility baseline water loss GPCD and most recently reported water loss GPCD to determine water savings.

---

[15] If current water loss levels exceed a utility's baseline, this value is treated as a deduction from total quantified savings.
[16] In the absence of having a baseline figure provided in the utility's most recently submitted 5-year water conservation plan, the historic 5-year average for water loss GPCD in the plan was used.
[17] Correspondence with utility staff.
[18] The study estimates a 2% demand reduction with 10% increase in price on a targeted customer class. By applying a ratio, it is possible to determine the savings for lower or higher percentage increases.

c. For estimated water savings that could be increased by implementing meter data management (MDM) and customer engagement portal applications, refer to Section 6 of this report.
    i. With these additional applications, water savings can be achieved through changed customer behavior and other real-time actions that go beyond water loss reduction.

6. Twice-a-week Outdoor Watering Restriction Ordinance

a. Estimated savings of 6.53% of total utility demand (Hermitte and Mace, 2012; Sierra Club-Lone Star Chapter and the National Wildlife Federation, 2015)
b. All savings estimates grow each year at the same rate demand figures for the utility grow in the regional water plan.

7. Outdoor landscape evaluations for single family (SF) customers

a. 127 outdoor evaluations performed since 2014
b. Estimated 8,000 gallons per year for each system evaluation (A&N Technical Services, 2005; Whitcomb, 2000)
    i. Assumed 75% savings from typical indoor and outdoor survey when only outdoor watering is evaluated
c. Approximately 22 gallons per day
d. Greater savings during peak periods
e. Lesser savings during off-peak periods
f. 20% decay rate per year attributed to customer behavior (A&N Technical Services, 2005)

8. Rain Barrels

a. In Region K, estimated savings of 22.4 gallons per year per gallon of capacity rebated, sold, or distributed (GDS Associates, 2002).
b. Estimated 10-year useful life for most barrels

5 Summary of Savings

Table 5-1. Savings by Water Conservation Activity (MG).

Year	Rain Barrels	Water Rate Increase	Outdoor Residential Survey	2x Watering Ordinance	TOTAL SAVINGS
2012					0
2013					0
2014			0.5		0.5
2015	0.01		0.9	51.2	52
2016	0.01	27	0.7	52.0	80
2017	0.01	27	0.5	52.9	81
2018	0.01	27	0.3	53.7	81
2019	0.01	27	0.1	54.5	82
2020	0.01	27		55.4	83
2021	0.01	27		56.2	83
2022	0.01	27		57.0	84
2023	0.01	27		57.8	85
2024	0.01	27		58.7	86
2025		27		59.5	87
2026		27		60.3	88
2027		27		61.2	89
2028		27		62.0	89
2029		27		62.8	90
2030		27		63.7	91
2031		27		64.2	92
2032		27		64.7	92
2033		27		65.2	93
2034		27		65.8	93
2035		27		66.3	94
2036		27		66.8	94
2037		27		67.3	95
2038		28		67.8	95
2039		28		68.3	96
2040		28		68.9	96

2051		28		73.8	102
2052		28		74.4	102
2053		28		75.0	103
2054		28		75.6	103
2055		28		76.2	104
2056		28		76.8	105
2057		28		77.4	105
2058		28		78.0	106
2059		28		78.6	106
2060		28		79.2	107
2061		28		79.7	108
2062		28		80.2	108
2063		28		80.8	109
2064		28		81.3	109
2065		28		81.8	110
2066		28		82.4	110
2067		28		82.9	111
2068		28		83.5	111
2069		28		84.0	112
2070		28		84.5	112

Table 5-2. Savings from Water Loss Reduction (MG).

Year	Utility Population	Water Loss GPCD	Total Savings from Water Loss Reduction
Baseline	-	15.00	0
2015	7,589	8.00	19
2016	7,747	8.00	20
2017	7,905	8.00	20
2018	8,062	8.00	21
2019	8,220	8.00	21
2020	8,378	8.00	21
2021	8,666	8.00	22
2022	8,954	8.00	23
2023	9,243	8.00	24
2024	9,531	8.00	24

6 Suggested Activities

Up to four activities were chosen as potential suggested activities for individual reports. These activities are: AMI system with customer portal, twice-per-week (or less) outdoor watering ordinances, strategic water rate increases, and rain barrels.

Activities were chosen because they are:

- Achievable
- Prevalence of vendors that can actually implement them
- Acceptability to city councils, MUD boards, et al.
- Easily adopted
- Cost effective
- Yield high savings relative to cost

AMI systems with customer engagement portals were also chosen because they represent a profusion of future applications that will undoubtedly continue to advance conservation efforts. AMI and meter data management (MDM) companies are developing new and innovative ways to benefit water providers, customers, and ultimately states that are pushing conservation and usage analytics further.

Each utility should be cognizant of the potential impact that these suggested activities may have on its own unique rate and revenue situation.

Benefits to consider:

- Avoided water supply and wastewater costs
    - The higher water purchase, transmission, and distribution costs are, the greater the potential benefit realized when large amounts of water are conserved with these activities.
- Avoided system expansion costs
    - Conserving water may allow a utility to postpone building new system capacity by decreasing demand even as population grows.

Costs to consider:

- Staff time and resources
- Unit cost per unit saved
- Implementation costs
- Stakeholder agreement and support
- Other overhead and budget considerations

6.1 Suggested Activities with Savings Estimates

1. Advanced Metering Infrastructure with Customer Engagement Portal

These portals, along with mobile applications and billing statements, can provide customers with much more access to their water use data in simple and compelling formats. This access and comparison with other customers' usage can reduce water use through changed behavior, as well as provide an opportunity for other conservation programs to be offered to the customer for increased adoption and additional savings. AMI systems support leak notification and web portals with real-time data. Any water loss reduction savings that these systems also yield were included in the water loss assessment of individual reports for this project.

- **a.** Specific utility results will vary based on portal features and frequency of customer notifications
- **b.** Potential savings estimate assumes 20% of residential customers will use and save water due to the portal (Westin Engineering, 2015)
- **c.** Estimate assumes customers will save 10% of total annual use due to the portal
    - i. Savings estimate of 10% is an average of results from multiple studies (Chesnutt and Mitchell, 2013; East Bay Municipal Utility District, 2014; IBM, 2011; Texas A&M and Texas Water Resources Institute, 2016; Westin Engineering, 2015)
- **d.** Residential customers' use assumed to make up approximately 67% of all retail customers' use based on utility profile information submitted to the TWDB
    - i. This was the most common percentage of residential use among participating utilities in this project.
    - ii. Actual customer class demand percentages will vary by utility.
- **e.** 20% of residential customers saving 10% with this customer class breakdown amounts to 1.34% of total demand
- **f.** Savings are assumed to increase along with demand as connections increase each year[19]
- **g.** See Table 6-1 for potential savings from this measure compared with the utility's WMS supply volumes targets.

[19] The 10% consumption reduction figure for 20% of residential customers is conservative, but savings could be greater when monitored yearly as customer engagement increases.

Table 6-1. Current Savings + Potential Savings from AMI with Customer Portal (MG).

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Potential Savings from AMI with Customer Portal	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)
2016	80	20	100	11	48	0	48	63
2017	81	20	101	11	48	0	48	64
2018	81	21	102	11	57	0	57	56
2019	82	21	103	11	67	0	67	47
2020	83	21	104	11	86	0	86	29
2021	83	22	106	12	95	0	95	22
2022	84	23	107	12	105	0	105	14
2023	85	24	109	12	114	0	114	6
2024	86	24	110	12	124	0	124	(1)
2025	87	25	112	12	133	0	133	(9)
2026	88	26	114	12	143	0	143	(17)
2027	89	27	115	13	152	0	152	(25)
2028	89	27	117	13	162	0	162	(32)
2029	90	28	118	13	171	0	171	(40)
2030	91	29	120	13	181	0	181	(48)
2031	92	30	121	13	190	0	190	(56)
2032	92	31	123	13	200	0	200	(64)
2033	93	32	124	13	210	0	210	(72)
2034	93	33	126	13	219	0	219	(80)
2035	94	34	127	14	229	0	229	(88)
2036	94	35	129	14	239	0	239	(96)
2037	95	36	131	14	249	0	249	(104)
2038	95	37	132	14	258	0	258	(112)
2039	96	38	134	14	268	0	268	(120)
2040	96	39	135	14	278	0	278	(128)

1. Employ efforts to maintain water loss volumes near baseline level or below.
2. In the future, as your utility finds water and/or wastewater service rate increases necessary, such pricing signals should continue to be effective in reducing demand.

Statewide Water Conservation Quantification Project
Johnson City Report • 2017

1 Introduction

In Texas' 2017 State Water Plan, municipal water conservation is projected to meet 9.6 percent[1] of the state's future water needs by 2070. According to the 16 regional water plans that comprise the state water plan, this is expected to be achieved through a variety of measures such as installation of water efficient plumbing fixtures, water conservation pricing structures, water system audits, landscape irrigation ordinances, as well as other water conservation activities. The 9.6 percent is "in addition to the estimated share of future passive conservation savings from plumbing codes and water efficiency standards, which are embedded in municipal water demand projections" (Texas Water Development Board, 2017).

In 2015, the Texas Legislature appropriated funds to the Texas Water Development Board (TWDB) to fund a research project principally charged with quantitatively determining the savings of municipal water conservation activities being implemented in relation to the recommended conservation goals (supply volumes) in the State Water Plan. As part of the project, individual reports were completed for all participating utilities.

With this report, utilities will benefit by receiving a clear and concise picture of its water conservation goals alongside estimated savings from quantifiable activities. In the event that current activity savings may not be able to reach long-term goals, this report offers suggestions on how utilities can reach water conservation goals with activities that are effective, easily adopted, have widespread appeal, and are quantifiable.

2 Municipal Conservation Terminology and Review of Methodology Used by Regional Planners

To make use of the results of this study, it is important to understand several key terms used in the water planning process.

What is a water user group?

In this report, a water user group (WUG) refers to a retail water provider in the form a city, municipal utility district, water control and improvement district, special utility district, water supply corporation, fresh water supply district, or other type of water utility. The TWDB further defines WUGs as one of the following (Texas Water Development Board, 2016b):

- Cities and towns with a population of 500 or more
- Non-city utilities providing more than 280 acre-feet per year per year of water for municipal use
- Collective reporting units (CRUs) consisting of grouped utilities having a common association

[1] Equal to 811,224 acre-feet per year in conservation savings.

- County-Wide WUGs:
    - County-Other (Rural/unincorporated areas of municipal water use)
    - Manufacturing
    - Steam electric power generation

What is a recommended water management strategy?

A recommended water management strategy (WMS) is a measure that will help ensure WUGs have adequate water supplies for their end users well into the future. WMS examples include river diversions, groundwater use, reservoir and aquifer development, and irrigation conservation. When WMS is referred to in this report, it refers only to municipal conservation, which may include water loss reduction as a part of the same strategy.

What is a WMS supply volume?

A WMS supply volume is the amount of water that a given strategy is expected to yield each decade in the planning period if carried out by the WUG. In this report, a WMS supply volume is the amount of water recommended to come from municipal water conservation.

Some regional water plans separate this strategy's supply volume into a volume for municipal water conservation and a volume for water loss reduction for each decade. The total strategy supply volume is the sum of both. A regional water plan may also refer to "advanced conservation" as part of this strategy. Advanced conservation usually indicates that the volume could be achieved through a more robust mix of conservation activities described in the plan.

2.1 Regional Planning Group Approach to Determining Supply Volumes

Each regional water planning group (RWPG) is responsible for producing its own individual plan that, if executed, will provide sufficient water to its WUGs throughout a 50-year planning period. These plans are completed in five-year cycles, with the most recent edition being completed in 2016. The 2016 regional plans make up the 2017 State Water Plan, which sets out WMS supply volumes for the years 2020 through 2070.

The decadal WMS supply volumes for municipal conservation were established by each of the RWPGs in much the same manner. The RWPGs generally followed the guidelines of the Texas Legislature's Water Conservation Implementation Task Force on the pace utilities should target to reduce gallons per capita per day (GPCD)[2] consumption levels.

The targeted reductions used by most regions follow this formula:

- For municipal WUGs with water use of 140 GPCD and greater, the goal is to reduce per capita water use by one percent per year until the level of 140 GPCD is reached,

[2] Regional water planning GPCD is defined as the annual volume of water pumped, diverted, or purchased minus the volume exported (sold) to other water systems or large industrial facilities divided by the permanent resident population of the Municipal Water User Group in the regional water planning process divided by 365. Saline and reused/recycled water are not included in this volume (Texas Water Development Board, 2012).

> after which, the goal is to reduce per capita water use by one-fourth percent per year for the remainder of the planning period (Texas Water Development Board, 2016j).

The yearly reductions in GPCD for a given WUG are then converted into recommended supply volumes in acre-feet per year for each decade as the reductions in consumption continue. Some regions reduce GPCD by slightly different percentages before and after the 140 GPCD threshold, some do not apply further reductions in GPCD for WUGs once they reach 140 GPCD, while others recommend only "advanced conservation" activities once WUGs meet 140 GPCD.

2.2 Methodology

In order to complete a uniform quantification process, the first engagement was with utilities that agreed to participate and collected as much relevant data as possible. These data included, among many others, historical GPCD consumption figures, advanced metering infrastructure (AMI) specifications, and detailed feedback on each conservation activity being implemented. Personal interviews focused on determining when and to what extent these activities were being employed, as well as assessing plans to continue such conservation. Examples of frequently implemented activities include tiered water rate conservation pricing, strategic water rate increases, outdoor irrigation audits and ordinances, and rain barrel distribution.

Subsequently, each utility's conservation activities were quantified through several different means, including evidence-based studies, utility field results and savings determinations, manufacturer guarantees, water loss audits, TWDB studies, and other information that assigned a savings value to the activity's implementation.

Every conservation activity studied and quantified has a gallons-per-year estimate, useful life, and decay rate (if applicable) associated with it. Some activities' savings are projected to grow as demand grows over time, while some savings are constant each year and subside once useful life has run its course. For expanded methodology and details on studies and formulas used to determine activity savings, refer to Section 6 of the State Report included as part of this document.

Once analyzed, the resulting savings estimates from each utility were compared with the recommended WMS supply volumes in its respective regional plan to determine if the savings met, exceeded, or fell short of those volumes. Individual utility savings were aggregated to compare with regional volumes, and regional savings were aggregated to compare with state volumes.

It is important to note that this report quantified activity savings—not including water loss reduction—for the WMS supply volume comparison dating back to 2012. The reason for this is, with a few exceptions, the regional planners used 2011 as the base year for establishing potential WMS supply volumes.[3] In addition, any conservation savings achieved through 2011 are assumed to be accounted for in the regional water planning GPCD for that year.[4] Thus, quantifying from 2012 and forward is the most accurate way to determine if utilities are meeting

---

[3] Confirmed via personal communication with Region C, H, K, and L Plan consultants.
[4] It was established with TWDB planning staff that 2011 GPCD levels were chosen because they represented the most current water use and conservation patterns at the time.

the recommended conservation volumes in the regional plans. This assumption is by no means 100 percent accurate, however. Some previously implemented activities' savings persist into future years beyond this starting point, while some activities' savings have ceased. One year's GPCD will not necessarily include all savings yielded by conservation activities that came before it, but the quantification assessment must have a starting point.

2.3 Quantifiable Savings

The key to the project being useful and reliable is that the results from year to year are measurable. Quantifying conservation activities that can be accurately measured provides greater certainty and better planning for all stakeholders.

While many utilities are engaged in a variety of conservation activities, not all can currently be properly measured. Some examples of these activities include education initiatives, website and social media engagement, and enforcement for water waste. That does not mean these measures are not essential. Education of consumers, for example, is a fundamental activity that makes all others effective, but little hard data exists to quantify the results of education alone.

In addition, the work of conservation coordinators can have a particularly significant effect on the savings of all other activities, but the specific savings attributed to that staff role is difficult to quantify.

3 Results

This report compares Johnson City's current water conservation activities and their quantified savings to two metrics: 1) Region K Water Plan's (Texas Water Development Board, 2016i) recommended WMS supply volumes for municipal conservation, and 2) Johnson City's own 5- and 10-year goals as established in its most recent water conservation plan submitted to the TWDB.

The WMS supply volumes for municipal water conservation are laid out by decade (2020 – 2070) in the regional water plans to serve as benchmarks for what each utility could achieve via that strategy during a 50-year planning period.[5]

The 5- and 10-year goals in Johnson City's most recent water conservation plan are established by the utility as realistic targets for reducing consumption over that timeframe. These reductions[6] are expressed in decreasing total GPCD [7] consumption and water loss GPCD.[8] [9]

---

[5] Some regional water plans separate this strategy volume into a volume for water conservation and a volume for water loss reduction for each decade. The total strategy volume is the sum of both.

[6] Occasionally, some utilities expect consumption to increase due to various reasons, such as an incoming industrial presence expected to raise consumption figures for the entire service area.

[7] As defined in TWDB water conservation plan annual report (Texas Water Development Board, 2016o): (Total Gallons in System ÷ Permanent Population) ÷ 365

[8] These plans also have targets for residential GPCD and water loss as a percentage (rather than GPCD), but this report does not address those goals.

[9] As defined in TWDB water conservation plan annual report (Texas Water Development Board, 2016o): (Total Water Loss ÷ Permanent Population) ÷ 365

The estimated savings in Tables 3-1 through 3-3 indicate the best information available as provided by utility staff. Some ongoing activities may not be known and are within a utility's service area are implemented on a micro-scale that may not be quantified. Individual households and businesses may be implementing conservation measures that are unknown and therefore cannot be included in the report.

Explanation of approach to assessing water loss reduction savings

Water loss reduction savings are defined as the volume of water participating utilities are realizing from their water loss mitigation efforts. For this report, this value is the difference between each individual utility's baseline[10] for water loss GPCD and its most recent water loss GPCD reported in 2015 water loss audits on file with TWDB. Savings from all water loss reduction efforts—including pipe replacements and leak repair—are assumed to be included in this comparison to a utility's baseline.

Note that because a single year (2015) value was used for comparison, it is possible that the 2015 value could be anomalous due to a number of events that may have occurred that year, such as a water main break, a particularly wet year, or a robust effort by the utility to curtail water loss. This will distort future savings figures that were carried forward in the study because water loss will inevitably increase or decrease in later years.

Ideally, using a rolling five-year average in the calculation would correct such anomalies. However, there was insufficient data to do that for every utility. The approach was to use the most complete water loss data possible, which was represented by the 2015 water loss audit. This problem will be further minimized, as continued data collection will allow five-year averages to be calculated for a majority of utilities.

In this way, water loss savings estimates are different from all other activity savings estimates in the project. Whether savings were positive or negative depended on where individual utilities established their own baselines or where their five-year average started, and what water loss GPCD value was reported in 2015.

3.1 Current Savings Compared to Conservation WMS Supply Volume (in Million Gallons) in Regional Water Plan

Table 3-1 shows the 2070 outlook for Johnson City with the utility's yearly recommended WMS supply volume in million gallons (MG) alongside its water savings from implemented activities, including from water loss reduction. These activities and their associated savings are covered in greater detail in Sections 4 and 5.

Starting in 2015, this table compares all quantified conservation activity and the recommended conservation WMS supply volume for the planning period. The following definitions pair with the column headers in Table 3-1.

Actual Current Conservation Activity Savings – All quantified activities currently being

[10] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.

performed by the utility, *excluding* savings from water loss reduction. The regional planners used 2011 GPCD as the baseline for determining future conservation WMS supply volumes, therefore the study quantifies utility savings starting in 2012 for this comparison. The summary of these savings can be referenced in Table 5-1.

Actual Water Loss Reduction Savings (as of 2015) – The difference between the baseline[11] for water loss GPCD and most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB. [12] The summary of these savings can be referenced in Table 5-2.

Total Savings from All Conservation Activity – Actual Current Conservation Activity Savings plus Actual Water Loss Reduction Savings (as of 2015).

Conservation WMS Volume – The recommended municipal water conservation supply volume in the regional plan for the decades ranging from 2020 to 2070. These volumes are converted to MG from the values listed in the plan in acre-feet and then calculated in annual increments.

Water Loss Reduction WMS Volume – Some regional water plans have a separate WMS volume for water conservation and for water loss reduction for each decade. If a WUG's regional plan has a WMS volume for water loss reduction, this column will have values other than zero.

Total Yearly WMS Volume – The sum of the Conservation WMS Volume and Water Loss Reduction WMS Volume.

Over (Short) – The amount that the utility's Total Savings from All Conservation Activity (since 2012), is over or below the Total Yearly WMS Volume in the regional water plan. If the amount falls below the WMS volume, it will appear in parentheses.

[11] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.

[12] If water loss GPCD has increased from the utility's baseline or historic five-year average to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount.

Table 3-1. Current Savings Compared to Conservation WMS Supply Volume (MG) in Regional Water Plan.

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)
2015	10	2.6	13	3	0	3	10
2016	10	2.8	13	3	0	3	10
2017	10	3.1	14	3	0	3	10

3.2 Utility Water Conservation Plan Goals – Total GPCD

Table 3-2 shows how Johnson City's quantified savings from its implemented activities compare with 5- and 10-year goals established in its individual water conservation plan submitted to the TWDB. The following definitions pair with the column headers in Table 3-2.

Utility Population – Estimated utility service area population for the years indicated.

Total GPCD Goals – Total GPCD goals start with the utility's baseline[13] for total GPCD and progress in subsequent years to match 5- and 10-year goals indicated in a utility's five-year water conservation plan on file with the TWDB. The first five annual GPCD goals were developed by spreading the difference between the baseline and five-year goal evenly over five years. The second five annual GPCD goals spread the difference between the five-year goal and 10-year goal evenly over the next five years.

Annual Savings Goal with Reduction in GPCD (MG) – This column shows what reductions from the baseline GPCD would yield in terms of volume each year as more water is saved. The volumes indicated here are what target GPCD goals look like expressed in million gallons. Annual volumes were derived using the formula: (baseline total GPCD – target total GPCD for that year) x 365 days ÷ 1,000,000 gallons.

Total Savings for All Current Quantified Activities (MG) – Total quantified savings for all current conservation activities and savings from water loss reduction. Refer to Tables 5-1 and 5-2 for details on these savings.

Over (Short) – The amount that the utility's total quantified savings for all current conservation activities (since 2012), including water loss reduction, is over or below the volume represented by reductions in GPCD each year. If the quantified savings are less than these target volumes, the value will appear in parentheses.

Table 3-2. Utility Water Conservation Plan Goals — Total GPCD.

Year #	Year	Utility Population	Total GPCD Goals	Annual Savings Goal with Reduction in GPCD (MG)	Total Savings for All Current Quantified Activities (MG)	Over (Short) (MG)
0	**Baseline**	-	124	0	0	0
1	2016	1,544	123	1	13	12
2	2017	1,671	122	1	14	12
3	2018	1,799	120	2	14	12
4	2019	1,926	119	3	14	11
5-year Goal	2020	2,053	118	4	15	10
6	2021	2,092	117	5	15	10
7	2022	2,131	116	6	15	9
8	2023	2,169	116	7	15	9
9	2024	2,208	115	7	16	8
10-year Goal	2025	2,247	114	8	16	8

[13] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for total GPCD from the utility's most recently submitted five-year water conservation plan was used.

3.3 Utility Water Conservation Plan Goals – Water Loss GPCD

Table 3-3 shows how Johnson City's most recent water loss audit compares with 5- and 10-year water loss goals in its water conservation plan. The following definitions pair with the column headers in Table 3-2.

Utility Population – Estimated utility service area population for the years indicated.

Water Loss GPCD Goals – Water loss GPCD goals start with the utility's baseline[14] for water loss GPCD and progress in subsequent years to match 5- and 10-year water loss goals indicated in a utility's five-year water conservation plan on file with the TWDB. The first five annual GPCD goals were developed by spreading the difference between the baseline and five-year goal evenly over five years. The second five annual GPCD goals spread the difference between the five-year goal and 10-year goal evenly over the next five years.

Yearly Savings Goal with Reduction in GPCD (MG) – This column shows what reductions from the baseline water loss GPCD would yield in terms of volume each year as more water is saved. The volumes indicated here are what target water loss GPCD goals look like expressed in million gallons. Annual volumes were derived using the formula: (baseline water loss GPCD – target water loss GPCD for that year) x 365 days ÷ 1,000,000 gallons.

Total Savings from Water Loss Reduction (MG) – The difference between a utility's established baseline for water loss GPCD and the most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB. If water loss GPCD has increased from the utility's baseline to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount. Reference Table 5-2 for savings from water loss reduction.

Over (Short) – The amount that the utility's total savings from water loss reduction is over or below the volume represented by reductions in GPCD each year. If water loss reduction savings are less than these target volumes, the value will appear in parentheses.

Table 3-3. Utility Water Conservation Plan Goals — Water Loss GPCD.

Year #	Year	Utility Population	Water Loss GPCD Goals	Yearly Savings Goal with Reduction in GPCD (MG)	Total Savings from Water Loss Reduction (MG)	Over (Short) (MG)
0	**Baseline**	-	12.00	0	0	0
1	2016	1,544	11.60	0	2.6	2
2	2017	1,671	11.20	0	2.8	2
3	2018	1,799	10.80	1	3.1	2
4	2019	1,926	10.40	1	3.3	2
5-year Goal	2020	2,053	10.00	1	3.5	2
6	2021	2,092	9.60	2	3.7	2
7	2022	2,131	9.20	2	3.8	2
8	2023	2,169	8.80	3	3.9	1
9	2024	2,208	8.40	3	4.0	1
10-year Goal	2025	2,247	8.00	3	4.0	1

[14] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.

4 Implemented Activities

Below is a list of completed activities with estimated water savings. Note that drought response and other measures are not included in the utility's water savings because they are temporary, awareness-based or not able to be accurately quantified on an annual basis.

These are not savings projections of potential future activities. Estimated savings are based on measures that have actually been implemented. If savings are shown to persist in future years, it is because the measure is permanent, such as an ordinance, or the savings are assumed to continue for the reason listed under the itemized activity. Estimated savings from water rate increases are the one exception to these conditions.

Water Rate Increases

Savings from water rate increases were included because entities such as the U.S. Environmental Protection Agency and others indicate specific savings for utilities that raise rates (Texas Water Development Board, 2013; U.S. E.P.A., 1998; Whitcomb, 1999). This project includes surveys of several utilities that have minimal education efforts, perform no other substantive conservation activities, and yet experienced significant demand reduction that coincided with rate increases. In those cases, savings estimates matched up closely with decreases in total GPCD. For many smaller utilities, especially those with customers lacking disposable income, this measure is the only tool used to conserve other than water loss reduction.

The following assumptions were made for water rate increases:

- The model assumes that savings persist into future years because it is expected that the utility will continue to make periodic rate increases in line with the percentage increases from previous years.
- Only the last two rate increases for a utility were quantified.
- Savings grow with demand because as new customers enter the service area, they are assumed to adhere to the same price elasticity model estimates.
- A weighted average for savings was used when rate increases differed between residential and industrial-commercial-institutional (ICI) customers based on the individual utility's customer class breakdown.
- When a utility raised rates using tiered rate conservation pricing, a 50/50 savings split was used when increases differed between base and volumetric rates.
    - The reasoning is that all customers must react to the base increase, yet the pricing signal is stronger when volumetric rate increases affect the higher usage customers.
    - The 50/50 split is reasonable because many customers will not reach the higher volumetric tiers.
    - Studies show that most customers do not actually know they have reached the higher volumetric tiers; just that their bill has increased (Texas Water Development Board, 2013).

4.1 Itemized Activities

1. **Utility Website**
    a. Easy-to-use website with conservation tips and water rates
    b. Features contact information for Public Works staff and customer service

2. **Continuing Public Education**
    a. The utility engages the public in many ways including:
        i. Brochures, bill messages, displays, and exhibits

3. **Water Loss Reduction Savings**[15]
    a. Savings of 2.6 MG annually in 2015
    b. Water loss reduction savings = the difference between a utility's baseline[16] water loss GPCD submitted in its most recent 5-year water conservation plan and its most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB
    c. If water loss GPCD has increased from the utility's baseline or historic 5-year average to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount.
    d. All savings estimates grow each year at the same rate population figures for the utility grow in the regional water plan.

4. **Water Rate Increase**
    a. Last rate increase:[17]
        i. 5.0% increase in 2014
    b. Estimated customer demand reduction of 1.0%
    c. Savings is cumulative and based on more than one source[18] (U.S. EPA, 1998; Whitcomb, 1999)
    d. Savings from rate increases are shown to persist over time, however, note that savings from these pricing signals will likely decrease if rates remain the same in future years.

5. **Automatic Meter Reading (AMR)/Advanced Metering Infrastructure (AMI)**
    a. These metering systems can save water in a number of ways, including from water loss reduction through improved leak detection.
    b. All water loss reduction savings associated with this activity are detailed in Section 5, which assessed utility baseline water loss GPCD and most recently reported water loss GPCD to determine water savings.

---

[15] If current water loss levels exceed a utility's baseline, this value is treated as a deduction from total quantified savings.
[16] In the absence of having a baseline figure provided in the utility's most recently submitted 5-year water conservation plan, the historic 5-year average for water loss GPCD in the plan was used.
[17] Correspondence with utility staff.
[18] The study estimates a 2% demand reduction with 10% increase in price on a targeted customer class. By applying a ratio, it is possible to determine the savings for lower or higher percentage increases.

c. For estimated water savings that could be increased by implementing meter data management (MDM) and customer engagement portal applications, refer to Section 6 of this report.
    i. With these additional applications, water savings can be achieved through changed customer behavior and other real-time actions that go beyond water loss reduction.

6. Twice-a-week Outdoor Watering Restriction Ordinance

a. Estimated savings of 6.53% of total utility demand (Hermitte and Mace, 2012; Sierra Club-Lone Star Chapter and the National Wildlife Federation, 2015)
b. All savings estimates grow each year at the same rate demand figures for the utility grow in the regional water plan.

5 Summary of Savings

Table 5-1. Savings by Water Conservation Activity (MG).

Year	2x Watering Ordinance	Water Rate Increases	TOTAL SAVINGS
2009		1.9	2
2010		1.9	2
2011		2.0	2
2012		3.0	3
2013		3.1	3
2014	6.8	3.1	10
2015	6.9	3.2	10
2016	7.0	3.2	10
2017	7.2	3.3	10
2018	7.3	3.3	11
2019	7.4	3.4	11
2020	7.5	3.5	11
2021	7.7	3.5	11
2022	7.8	3.6	11
2023	7.9	3.6	12
2024	8.0	3.7	12

2070	10.2	4.7	15

Table 5-2. Savings from Water Loss Reduction (MG).

Year	Utility Population	Water Loss GPCD	Total Savings from Water Loss Reduction
2014	-	12	0
2015	1,417	7	2.6
2016	1,544	7	2.8
2017	1,671	7	3.1
2018	1,799	7	3.3
2019	1,926	7	3.5
2020	2,053	7	3.7
2021	2,092	7	3.8
2022	2,131	7	3.9
2023	2,169	7	4.0
2024	2,208	7	4.0

6 Suggested Activities

Up to four activities were chosen as potential suggested activities for individual reports. These activities are: AMI system with customer portal, twice-per-week (or less) outdoor watering ordinances, strategic water rate increases, and rain barrels.

Activities were chosen because they are:

- Achievable
- Prevalence of vendors that can actually implement them
- Acceptability to city councils, MUD boards, et al.
- Easily adopted
- Cost effective
- Yield high savings relative to cost

AMI systems with customer engagement portals were also chosen because they represent a profusion of future applications that will undoubtedly continue to advance conservation efforts. AMI and meter data management (MDM) companies are developing new and innovative ways to benefit water providers, customers, and ultimately states that are pushing conservation and usage analytics further.

Each utility should be cognizant of the potential impact that these suggested activities may have on its own unique rate and revenue situation.

Benefits to consider:

- Avoided water supply and wastewater costs
    - The higher water purchase, transmission, and distribution costs are, the greater the potential benefit realized when large amounts of water are conserved with these activities.
- Avoided system expansion costs
    - Conserving water may allow a utility to postpone building new system capacity by decreasing demand even as population grows.

Costs to consider:

- Staff time and resources
- Unit cost per unit saved
- Implementation costs
- Stakeholder agreement and support
- Other overhead and budget considerations

6.1 Suggested Activities with Savings Estimates

1. Advanced Metering Infrastructure with Customer Engagement Portal

These portals, along with mobile applications and billing statements, can provide customers with much more access to their water use data in simple and compelling formats. This access and comparison with other customers' usage can reduce water use through changed behavior, as well as provide an opportunity for other conservation programs to be offered to the customer for increased adoption and additional savings. AMI systems support leak notification and web portals with real-time data. Any water loss reduction savings that these systems also yield were included in the water loss assessment of individual reports for this project.

a. Specific utility results will vary based on portal features and frequency of customer notifications

b. Potential savings estimate assumes 20% of residential customers will use and save water due to the portal (Westin Engineering, 2015)

c. Estimate assumes customers will save 10% of total annual use due to the portal

   i. Savings estimate of 10% is an average of results from multiple studies (Chesnutt and Mitchell, 2013; East Bay Municipal Utility District, 2014; IBM, 2011; Texas A&M and Texas Water Resources Institute, 2016; Westin Engineering, 2015)

d. Residential customers' use assumed to make up approximately 67% of all retail customers' use based on utility profile information submitted to the TWDB

   i. This was the most common percentage of residential use among participating utilities in this project.

   ii. Actual customer class demand percentages will vary by utility.

e. 20% of residential customers saving 10% with this customer class breakdown amounts to 1.34% of total demand

f. Savings are assumed to increase along with demand as connections increase each year[19]

g. See Table 6-1 for potential savings from this measure compared with the utility's WMS supply volumes targets.

[19] The 10% consumption reduction figure for 20% of residential customers is conservative, but savings could be greater when monitored yearly as customer engagement increases.

Table 6-1. Current Savings + Potential Savings from AMI with Customer Portal (MG).

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Potential Savings from AMI with Customer Portal	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)
2016	10	3	13	1	3	0	3	11
2017	10	3	14	1	3	0	3	12
2018	11	3	14	1	4	0	4	12
2019	11	4	14	2	5	0	5	11
2020	11	4	15	2	6	0	6	10
2021	11	4	15	2	6	0	6	10
2022	11	4	15	2	7	0	7	10
2023	12	4	15	2	7	0	7	10
2024	12	4	16	2	7	0	7	10
2025	12	4	16	2	8	0	8	10
2026	12	4	16	2	8	0	8	10
2027	12	4	16	2	9	0	9	10
2028	12	4	17	2	9	0	9	9
2029	13	4	17	2	9	0	9	9
2030	13	4	17	2	10	0	10	9
2031	13	4	17	2	10	0	10	9
2032	13	5	18	2	10	0	10	10
2033	13	5	18	2	10	0	10	10
2034	13	5	18	2	10	0	10	10
2035	13	5	18	2	10	0	10	10
2036	13	5	18	2	10	0	10	10
2037	13	5	18	2	10	0	10	10
2038	14	5	18	2	10	0	10	11
2039	14	5	19	2	10	0	10	11
2040	14	5	19	2	10	0	10	11

2. Rain Barrels
    a. In Region K, utilities could save approximately 22.4 gallons per year per gallon of capacity rebated, sold, or distributed (GDS Associates, 2002).
    b. Estimated 10-year useful life for most barrels

Statewide Water Conservation Quantification Project
City of Llano Report • 2017

1 Introduction

In Texas' 2017 State Water Plan, municipal water conservation is projected to meet 9.6 percent[1] of the state's future water needs by 2070. According to the 16 regional water plans that comprise the state water plan, this is expected to be achieved through a variety of measures such as installation of water efficient plumbing fixtures, water conservation pricing structures, water system audits, landscape irrigation ordinances, as well as other water conservation activities. The 9.6 percent is "in addition to the estimated share of future passive conservation savings from plumbing codes and water efficiency standards, which are embedded in municipal water demand projections" (Texas Water Development Board, 2017).

In 2015, the Texas Legislature appropriated funds to the Texas Water Development Board (TWDB) to fund a research project principally charged with quantitatively determining the savings of municipal water conservation activities being implemented in relation to the recommended conservation goals (supply volumes) in the State Water Plan. As part of the project, individual reports were completed for all participating utilities.

With this report, utilities will benefit by receiving a clear and concise picture of its water conservation goals alongside estimated savings from quantifiable activities. In the event that current activity savings may not be able to reach long-term goals, this report offers suggestions on how utilities can reach water conservation goals with activities that are effective, easily adopted, have widespread appeal, and are quantifiable.

2 Municipal Conservation Terminology and Review of Methodology Used by Regional Planners

To make use of the results of this study, it is important to understand several key terms used in the water planning process.

What is a water user group?

In this report, a water user group (WUG) refers to a retail water provider in the form a city, municipal utility district, water control and improvement district, special utility district, water supply corporation, fresh water supply district, or other type of water utility. The TWDB further defines WUGs as one of the following (Texas Water Development Board, 2016b):

- Cities and towns with a population of 500 or more
- Non-city utilities providing more than 280 acre-feet per year per year of water for municipal use
- Collective reporting units (CRUs) consisting of grouped utilities having a common association

[1] Equal to 811,224 acre-feet per year in conservation savings.

- County-Wide WUGs:
    - County-Other (Rural/unincorporated areas of municipal water use)
    - Manufacturing
    - Steam electric power generation

What is a recommended water management strategy?

A recommended water management strategy (WMS) is a measure that will help ensure WUGs have adequate water supplies for their end users well into the future. WMS examples include river diversions, groundwater use, reservoir and aquifer development, and irrigation conservation. When WMS is referred to in this report, it refers only to municipal conservation, which may include water loss reduction as a part of the same strategy.

What is a WMS supply volume?

A WMS supply volume is the amount of water that a given strategy is expected to yield each decade in the planning period if carried out by the WUG. In this report, a WMS supply volume is the amount of water recommended to come from municipal water conservation.

Some regional water plans separate this strategy's supply volume into a volume for municipal water conservation and a volume for water loss reduction for each decade. The total strategy supply volume is the sum of both. A regional water plan may also refer to "advanced conservation" as part of this strategy. Advanced conservation usually indicates that the volume could be achieved through a more robust mix of conservation activities described in the plan.

2.1 Regional Planning Group Approach to Determining Supply Volumes

Each regional water planning group (RWPG) is responsible for producing its own individual plan that, if executed, will provide sufficient water to its WUGs throughout a 50-year planning period. These plans are completed in five-year cycles, with the most recent edition being completed in 2016. The 2016 regional plans make up the 2017 State Water Plan, which sets out WMS supply volumes for the years 2020 through 2070.

The decadal WMS supply volumes for municipal conservation were established by each of the RWPGs in much the same manner. The RWPGs generally followed the guidelines of the Texas Legislature's Water Conservation Implementation Task Force on the pace utilities should target to reduce gallons per capita per day (GPCD)[2] consumption levels.

The targeted reductions used by most regions follow this formula:

- For municipal WUGs with water use of 140 GPCD and greater, the goal is to reduce per capita water use by one percent per year until the level of 140 GPCD is reached,

[2] Regional water planning GPCD is defined as the annual volume of water pumped, diverted, or purchased minus the volume exported (sold) to other water systems or large industrial facilities divided by the permanent resident population of the Municipal Water User Group in the regional water planning process divided by 365. Saline and reused/recycled water are not included in this volume (Texas Water Development Board, 2012).

> after which, the goal is to reduce per capita water use by one-fourth percent per year for the remainder of the planning period (Texas Water Development Board, 2016j).

The yearly reductions in GPCD for a given WUG are then converted into recommended supply volumes in acre-feet per year for each decade as the reductions in consumption continue. Some regions reduce GPCD by slightly different percentages before and after the 140 GPCD threshold, some do not apply further reductions in GPCD for WUGs once they reach 140 GPCD, while others recommend only "advanced conservation" activities once WUGs meet 140 GPCD.

2.2 Methodology

In order to complete a uniform quantification process, the first engagement was with utilities that agreed to participate and collected as much relevant data as possible. These data included, among many others, historical GPCD consumption figures, advanced metering infrastructure (AMI) specifications, and detailed feedback on each conservation activity being implemented. Personal interviews focused on determining when and to what extent these activities were being employed, as well as assessing plans to continue such conservation. Examples of frequently implemented activities include tiered water rate conservation pricing, strategic water rate increases, outdoor irrigation audits and ordinances, and rain barrel distribution.

Subsequently, each utility's conservation activities were quantified through several different means, including evidence-based studies, utility field results and savings determinations, manufacturer guarantees, water loss audits, TWDB studies, and other information that assigned a savings value to the activity's implementation.

Every conservation activity studied and quantified has a gallons-per-year estimate, useful life, and decay rate (if applicable) associated with it. Some activities' savings are projected to grow as demand grows over time, while some savings are constant each year and subside once useful life has run its course. For expanded methodology and details on studies and formulas used to determine activity savings, refer to Section 6 of the State Report included as part of this document.

Once analyzed, the resulting savings estimates from each utility were compared with the recommended WMS supply volumes in its respective regional plan to determine if the savings met, exceeded, or fell short of those volumes. Individual utility savings were aggregated to compare with regional volumes, and regional savings were aggregated to compare with state volumes.

It is important to note that this report quantified activity savings—not including water loss reduction—for the WMS supply volume comparison dating back to 2012. The reason for this is, with a few exceptions, the regional planners used 2011 as the base year for establishing potential WMS supply volumes.[3] In addition, any conservation savings achieved through 2011 are assumed to be accounted for in the regional water planning GPCD for that year.[4] Thus, quantifying from 2012 and forward is the most accurate way to determine if utilities are meeting

[3] Confirmed via personal communication with Region C, H, K, and L Plan consultants.
[4] It was established with TWDB planning staff that 2011 GPCD levels were chosen because they represented the most current water use and conservation patterns at the time.

the recommended conservation volumes in the regional plans. This assumption is by no means 100 percent accurate, however. Some previously implemented activities' savings persist into future years beyond this starting point, while some activities' savings have ceased. One year's GPCD will not necessarily include all savings yielded by conservation activities that came before it, but the quantification assessment must have a starting point.

2.3 Quantifiable Savings

The key to the project being useful and reliable is that the results from year to year are measurable. Quantifying conservation activities that can be accurately measured provides greater certainty and better planning for all stakeholders.

While many utilities are engaged in a variety of conservation activities, not all can currently be properly measured. Some examples of these activities include education initiatives, website and social media engagement, and enforcement for water waste. That does not mean these measures are not essential. Education of consumers, for example, is a fundamental activity that makes all others effective, but little hard data exists to quantify the results of education alone.

In addition, the work of conservation coordinators can have a particularly significant effect on the savings of all other activities, but the specific savings attributed to that staff role is difficult to quantify.

3 Results

This report compares Llano's current water conservation activities and their quantified savings to two metrics: 1) Region K Water Plan's (Texas Water Development Board, 2016i) recommended WMS supply volumes for municipal conservation, and 2) Llano's own 5- and 10-year goals as established in its most recent water conservation plan submitted to the TWDB.

The WMS supply volumes for municipal water conservation are laid out by decade (2020 – 2070) in the regional water plans to serve as benchmarks for what each utility could achieve via that strategy during a 50-year planning period.[5]

The 5- and 10-year goals in Llano's most recent water conservation plan are established by the utility as realistic targets for reducing consumption over that timeframe. These reductions[6] are expressed in decreasing total GPCD[7] consumption and water loss GPCD.[8][9]

The estimated savings in Tables 3-1 through 3-3 indicate the best information available as

---

[5] Some regional water plans separate this strategy volume into a volume for water conservation and a volume for water loss reduction for each decade. The total strategy volume is the sum of both.

[6] Occasionally, some utilities expect consumption to increase due to various reasons, such as an incoming industrial presence expected to raise consumption figures for the entire service area.

[7] As defined in TWDB water conservation plan annual report (Texas Water Development Board, 2016o): (Total Gallons in System ÷ Permanent Population) ÷ 365

[8] These plans also have targets for residential GPCD and water loss as a percentage (rather than GPCD), but this report does not address those goals.

[9] As defined in TWDB water conservation plan annual report (Texas Water Development Board, 2016o): (Total Water Loss ÷ Permanent Population) ÷ 365

provided by utility staff. Some ongoing activities may not be known and are within a utility's service area are implemented on a micro-scale that may not be quantified. Individual households and businesses may be implementing conservation measures that are unknown and therefore cannot be included in the report.

Explanation of approach to assessing water loss reduction savings

Water loss reduction savings are defined as the volume of water participating utilities are realizing from their water loss mitigation efforts. For this report, this value is the difference between each individual utility's baseline[10] for water loss GPCD and its most recent water loss GPCD reported in 2015 water loss audits on file with TWDB. Savings from all water loss reduction efforts—including pipe replacements and leak repair—are assumed to be included in this comparison to a utility's baseline.

Note that because a single year (2015) value was used for comparison, it is possible that the 2015 value could be anomalous due to a number of events that may have occurred that year, such as a water main break, a particularly wet year, or a robust effort by the utility to curtail water loss. This will distort future savings figures that were carried forward in the study because water loss will inevitably increase or decrease in later years.

Ideally, using a rolling five-year average in the calculation would correct such anomalies. However, there was insufficient data to do that for every utility. The approach was to use the most complete water loss data possible, which was represented by the 2015 water loss audit. This problem will be further minimized, as continued data collection will allow five-year averages to be calculated for a majority of utilities.

In this way, water loss savings estimates are different from all other activity savings estimates in the project. Whether savings were positive or negative depended on where individual utilities established their own baselines or where their five-year average started, and what water loss GPCD value was reported in 2015.

3.1 Current Savings Compared to Conservation WMS Supply Volume (in Million Gallons) in Regional Water Plan

Table 3-1 shows the 2070 outlook for Llano with the utility's yearly recommended WMS supply volume in million gallons (MG) alongside its water savings from implemented activities, including from water loss reduction. These activities and their associated savings are covered in greater detail in Sections 4 and 5.

Starting in 2015, this table compares all quantified conservation activity and the recommended conservation WMS supply volume for the planning period. The following definitions pair with the column headers in Table 3-1.

<u>Actual Current Conservation Activity Savings</u> – All quantified activities currently being performed by the utility, *excluding* savings from water loss reduction. The regional planners used

[10] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.

2011 GPCD as the baseline for determining future conservation WMS supply volumes, therefore the study quantifies utility savings starting in 2012 for this comparison. The summary of these savings can be referenced in Table 5-1.

Actual Water Loss Reduction Savings (as of 2015) – The difference between the baseline[11] for water loss GPCD and most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB. [12] The summary of these savings can be referenced in Table 5-2.

Total Savings from All Conservation Activity – Actual Current Conservation Activity Savings plus Actual Water Loss Reduction Savings (as of 2015).

Conservation WMS Volume – The recommended municipal water conservation supply volume in the regional plan for the decades ranging from 2020 to 2070. These volumes are converted to MG from the values listed in the plan in acre-feet and then calculated in annual increments.

Water Loss Reduction WMS Volume – Some regional water plans have a separate WMS volume for water conservation and for water loss reduction for each decade. If a WUG's regional plan has a WMS volume for water loss reduction, this column will have values other than zero.

Total Yearly WMS Volume – The sum of the Conservation WMS Volume and Water Loss Reduction WMS Volume.

Over (Short) – The amount that the utility's Total Savings from All Conservation Activity (since 2012), is over or below the Total Yearly WMS Volume in the regional water plan. If the amount falls below the WMS volume, it will appear in parentheses.

[11] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.
[12] If water loss GPCD has increased from the utility's baseline or historic five-year average to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount.

Table 3-1. Current Savings Compared to Conservation WMS Supply Volume (MG) in Regional Water Plan.

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)
2015	7	16	23	13	0	13	10
2016	7	16	23	16	0	16	7

2070	7	19	26	82	0	82	(56)

3.2 Utility Water Conservation Plan Goals – Total GPCD

Table 3-2 shows how Llano's quantified savings from its implemented activities compare with 5- and 10-year goals established in its individual water conservation plan submitted to the TWDB. The following definitions pair with the column headers in Table 3-2.

Utility Population – Estimated utility service area population for the years indicated.

Total GPCD Goals – Total GPCD goals start with the utility's baseline[13] for total GPCD and progress in subsequent years to match 5- and 10-year goals indicated in a utility's five-year water conservation plan on file with the TWDB. The first five annual GPCD goals were developed by spreading the difference between the baseline and five-year goal evenly over five years. The second five annual GPCD goals spread the difference between the five-year goal and 10-year goal evenly over the next five years.

Annual Savings Goal with Reduction in GPCD (MG) – This column shows what reductions from the baseline GPCD would yield in terms of volume each year as more water is saved. The volumes indicated here are what target GPCD goals look like expressed in million gallons. Annual volumes were derived using the formula: (baseline total GPCD – target total GPCD for that year) x 365 days ÷ 1,000,000 gallons.

Total Savings for All Current Quantified Activities (MG) – Total quantified savings for all current conservation activities and savings from water loss reduction. Refer to Tables 5-1 and 5-2 for details on these savings.

Over (Short) – The amount that the utility's total quantified savings for all current conservation activities (since 2012), including water loss reduction, is over or below the volume represented by reductions in GPCD each year. If the quantified savings are less than these target volumes, the value will appear in parentheses.

Table 3-2. Utility Water Conservation Plan Goals — Total GPCD.

Year #	Year	Utility Population	Total GPCD Goals	Annual Savings Goal with Reduction in GPCD (MG)	Total Savings for All Current Quantified Activities (MG)	Over (Short) (MG)
0	**Baseline**	-	216	0	0	0
1	2015	3,341	214	3	23	20
2	2016	3,386	212	5	23	18
3	2017	3,431	209	8	23	15
4	2018	3,475	207	11	23	12
5-year Goal	2019	3,520	205	14	24	10
6	2020	3,565	203	17	24	7
7	2021	3,584	201	20	24	4
8	2022	3,604	198	23	24	1
9	2023	3,623	196	26	24	(2)
10-year Goal	2024	3,643	194	29	24	(5)

[13] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for total GPCD from the utility's most recently submitted five-year water conservation plan was used.

3.3 Utility Water Conservation Plan Goals – Water Loss GPCD

Table 3-3 shows how Llano's most recent water loss audit compares with 5- and 10-year water loss goals in its water conservation plan. The following definitions pair with the column headers in Table 3-2.

Utility Population – Estimated utility service area population for the years indicated.

Water Loss GPCD Goals – Water loss GPCD goals start with the utility's baseline[14] for water loss GPCD and progress in subsequent years to match 5- and 10-year water loss goals indicated in a utility's five-year water conservation plan on file with the TWDB. The first five annual GPCD goals were developed by spreading the difference between the baseline and five-year goal evenly over five years. The second five annual GPCD goals spread the difference between the five-year goal and 10-year goal evenly over the next five years.

Yearly Savings Goal with Reduction in GPCD (MG) – This column shows what reductions from the baseline water loss GPCD would yield in terms of volume each year as more water is saved. The volumes indicated here are what target water loss GPCD goals look like expressed in million gallons. Annual volumes were derived using the formula: (baseline water loss GPCD – target water loss GPCD for that year) x 365 days ÷ 1,000,000 gallons.

Total Savings from Water Loss Reduction (MG) – The difference between a utility's established baseline for water loss GPCD and the most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB. If water loss GPCD has increased from the utility's baseline to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount. Reference Table 5-2 for savings from water loss reduction.

Over (Short) – The amount that the utility's total savings from water loss reduction is over or below the volume represented by reductions in GPCD each year. If water loss reduction savings are less than these target volumes, the value will appear in parentheses.

Table 3-3. Utility Water Conservation Plan Goals — Water Loss GPCD.

Year #	Year	Utility Population	Water Loss GPCD Goals	Yearly Savings Goal with Reduction in GPCD (MG)	Total Savings from Water Loss Reduction (MG)	Over (Short) (MG)
0	**Baseline**	-	27.00	0	0	0
1	2015	3,341	26.40	1	16	15
2	2016	3,386	25.80	1	16	15
3	2017	3,431	25.20	2	16	14
4	2018	3,475	24.60	3	16	13
5-year Goal	2019	3,520	24.00	4	17	13
6	2020	3,565	23.20	5	17	12
7	2021	3,584	22.40	6	17	11
8	2022	3,604	21.60	7	17	10
9	2023	3,623	20.80	8	17	9
10-year Goal	2024	3,643	20.00	9	17	8

[14] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.

4 Implemented Activities

Below is a list of completed activities with estimated water savings. Note that drought response and other measures are not included in the utility's water savings because they are temporary, awareness-based or not able to be accurately quantified on an annual basis.

These are not savings projections of potential future activities. Estimated savings are based on measures that have actually been implemented. If savings are shown to persist in future years, it is because the measure is permanent, such as an ordinance, or the savings are assumed to continue for the reason listed under the itemized activity. Estimated savings from water rate increases are the one exception to these conditions.

Water Rate Increases

Savings from water rate increases were included because entities such as the U.S. Environmental Protection Agency and others indicate specific savings for utilities that raise rates (Texas Water Development Board, 2013; U.S. E.P.A., 1998; Whitcomb, 1999). This project includes surveys of several utilities that have minimal education efforts, perform no other substantive conservation activities, and yet experienced significant demand reduction that coincided with rate increases. In those cases, savings estimates matched up closely with decreases in total GPCD. For many smaller utilities, especially those with customers lacking disposable income, this measure is the only tool used to conserve other than water loss reduction.

The following assumptions were made for water rate increases:

- The model assumes that savings persist into future years because it is expected that the utility will continue to make periodic rate increases in line with the percentage increases from previous years.
- Only the last two rate increases for a utility were quantified.
- Savings grow with demand because as new customers enter the service area, they are assumed to adhere to the same price elasticity model estimates.
- A weighted average for savings was used when rate increases differed between residential and industrial-commercial-institutional (ICI) customers based on the individual utility's customer class breakdown.
- When a utility raised rates using tiered rate conservation pricing, a 50/50 savings split was used when increases differed between base and volumetric rates.
    - The reasoning is that all customers must react to the base increase, yet the pricing signal is stronger when volumetric rate increases affect the higher usage customers.
    - The 50/50 split is reasonable because many customers will not reach the higher volumetric tiers.
    - Studies show that most customers do not actually know they have reached the higher volumetric tiers; just that their bill has increased (Texas Water Development Board, 2013).

4.1 Itemized Activities

1. **Utility Website**
   a. Easy-to-use website with conservation tips and water rates
   b. Features contact information for Public Works staff and customer service

2. **Continuing Public Education**
   a. The utility engages the public in many ways including:
      i. Brochures, bill messages, displays, and exhibits

3. **Water Loss Reduction Savings**[15]
   a. Savings of 15.9 MG annually in 2015
   b. Water loss reduction savings = the difference between a utility's baseline[16] water loss GPCD submitted in its most recent 5-year water conservation plan and its most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB
   c. If water loss GPCD has increased from the utility's baseline or historic 5-year average to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount.
   d. All savings estimates grow each year at the same rate population figures for the utility grow in the regional water plan.

4. **Conservation Pricing and Water Rate Increases**
   a. Tiered rate structure in place saves approximately 2.5% of total demand
   b. Savings is cumulative and based on more than one source[17] (U.S. EPA, 1998; TWDB, 2013)

5. **Automatic Meter Reading (AMR)/Advanced Metering Infrastructure (AMI)**
   a. These metering systems can save water in a number of ways, including from water loss reduction through improved leak detection.
   b. All water loss reduction savings associated with this activity are detailed in Section 5, which assessed utility baseline water loss GPCD and most recently reported water loss GPCD to determine water savings.
   c. For estimated water savings that could be increased by implementing meter data management (MDM) and customer engagement portal applications, refer to Section 6 of this report.
      i. With these additional applications, water savings can be achieved through changed customer behavior and other real-time actions that go beyond water loss reduction.

---

[15] If current water loss levels exceed a utility's baseline, this value is treated as a deduction from total quantified savings.
[16] In the absence of having a baseline figure provided in the utility's most recently submitted 5-year water conservation plan, the historic 5-year average for water loss GPCD in the plan was used.
[17] The study estimates a 2% demand reduction with 10% increase in price on a targeted customer class. By applying a ratio, it is possible to determine the savings for lower or higher percentage increases.

6. **Outdoor Landscape Evaluations (SF) with Indoor Component**
    a. 12 outdoor evaluations performed since 2013
    b. Estimated 8,000 gallons per year for each system evaluation (A&N Technical Services, 2005)
        i. Assumed 65% savings from typical indoor and outdoor survey when only outdoor watering is evaluated (Whitcomb, 2000)
    c. Approximately 22 gallons per day
    d. Greater savings during peak periods
    e. Lesser savings during off-peak periods

        20% decay rate per year attributed to customer behavior (A&N Technical Services, 2005)

5 Summary of Savings

Table 5-1. Savings by Water Conservation Activity (MG).

Year	Irrigation Audits	Conservation Pricing	TOTAL SAVINGS
2009	0.14	6.8	6.9
2010	0.16	6.8	6.9
2011	0.15	6.8	6.9
2012	0.15	6.8	7.0
2013	0.15	6.9	7.0
2014	0.14	6.9	7.0
2015	0.14	6.9	7.0
2016	0.10	6.9	7.0
2017	0.06	6.9	7.0
2018	0.03	7.0	7.0
2019	0.01	7.0	7.0
2020	0	7.0	7.0
2021	0	7.0	7.0

2021	3,584	14.00	17.0
2022	3,604	14.00	17.1
2023	3,623	14.00	17.2
2024	3,643	14.00	17.3

6 Suggested Activities

Up to four activities were chosen as potential suggested activities for individual reports. These activities are: AMI system with customer portal, twice-per-week (or less) outdoor watering ordinances, strategic water rate increases, and rain barrels.

Activities were chosen because they are:

- Achievable
- Prevalence of vendors that can actually implement them
- Acceptability to city councils, MUD boards, et al.
- Easily adopted
- Cost effective
- Yield high savings relative to cost

AMI systems with customer engagement portals were also chosen because they represent a profusion of future applications that will undoubtedly continue to advance conservation efforts. AMI and meter data management (MDM) companies are developing new and innovative ways to benefit water providers, customers, and ultimately states that are pushing conservation and usage analytics further.

Each utility should be cognizant of the potential impact that these suggested activities may have on its own unique rate and revenue situation.

Benefits to consider:

- Avoided water supply and wastewater costs
  - The higher water purchase, transmission, and distribution costs are, the greater the potential benefit realized when large amounts of water are conserved with these activities.
- Avoided system expansion costs

- Conserving water may allow a utility to postpone building new system capacity by decreasing demand even as population grows.

Costs to consider:

- Staff time and resources
- Unit cost per unit saved
- Implementation costs
- Stakeholder agreement and support
- Other overhead and budget considerations

6.1 Suggested Activities with Savings Estimates

1. Twice-a-week Outdoor Watering Restriction Ordinance

a. Potentially 6.53% savings of total demand (Hermitte and Mace, 2012; Sierra Club-Lone Star Chapter and National Wildlife Federation, 2015)

i. Average Region K savings

ii. Specific percentage of outdoor usage unknown for your utility at this time

b. Savings could be 18 MG per year with current demand.

c. See Table 6-1 for potential savings from this measure compared with the city's WMS supply volumes targets.

Table 6-1. Current Savings + Potential Savings from 2x per Week Watering Ordinance (MG).

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Potential Savings from Ordinance	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)
2016	7	16	23	18	16	0	16	25
2017	7	16	23	18	16	0	16	26
2018	7	16	23	18	19	0	19	23
2019	7	17	24	18	22	0	22	20
2020	7	17	24	18	29	0	29	14
2021	7	17	24	18	30	0	30	13
2022	7	17	24	18	31	0	31	12
2023	7	17	24	19	32	0	32	11
2024	7	17	24	19	33	0	33	10
2025	7	17	25	19	34	0	34	10
2026	7	17	25	19	35	0	35	9
2027	7	18	25	19	36	0	36	8
2028	7	18	25	19	37	0	37	7
2029	7	18	25	19	37	0	37	6
2030	7	18	25	19	38	0	38	6
2031	7	18	25	19	39	0	39	5
2032	7	18	25	19	40	0	40	4
2033	7	18	25	19	41	0	41	3
2034	7	18	25	19	42	0	42	2
2035	7	18	25	19	43	0	43	1
2036	7	18	25	19	43	0	43	0
2037	7	18	25	19	44	0	44	(0)
2038	7	18	25	19	45	0	45	(1)
2039	7	18	25	19	46	0	46	(2)
2040	7	18	25	19	47	0	47	(3)

2. Advanced Metering Infrastructure with Customer Engagement Portal

These portals, along with mobile applications and billing statements, can provide customers with much more access to their water use data in simple and compelling formats. This access and comparison with other customers' usage can reduce water use through changed behavior, as well as provide an opportunity for other conservation programs to be offered to the customer for increased adoption and additional savings. AMI systems support leak notification and web portals with real-time data. Any water loss reduction savings that these systems also yield were included in the water loss assessment of individual reports for this project.

- **a.** Specific utility results will vary based on portal features and frequency of customer notifications
- **b.** Potential savings estimate assumes 20% of residential customers will use and save water due to the portal (Westin Engineering, 2015)
- **c.** Estimate assumes customers will save 10% of total annual use due to the portal
    - i. Savings estimate of 10% is an average of results from multiple studies (Chesnutt and Mitchell, 2013; East Bay Municipal Utility District, 2014; IBM, 2011; Texas A&M and Texas Water Resources Institute, 2016; Westin Engineering, 2015)
- **d.** Residential customers' use assumed to make up approximately 67% of all retail customers' use based on utility profile information submitted to the TWDB
    - i. This was the most common percentage of residential use among participating utilities in this project.
    - ii. Actual customer class demand percentages will vary by utility.
- **e.** 20% of residential customers saving 10% with this customer class breakdown amounts to 1.34% of total demand
- **f.** Savings are assumed to increase along with demand as connections increase each year[18]
- **g.** See Table 6-2 for potential savings from this measure compared with the utility's WMS supply volumes targets.

[18] The 10% consumption reduction figure for 20% of residential customers is conservative, but savings could be greater when monitored yearly as customer engagement increases.

Table 6-2. Current Savings + Potential Savings from AMI with Customer Portal (MG).

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Potential Savings from AMI with Customer Portal	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)
2016	7	16	23	4	16	0	16	11
2017	7	16	23	4	16	0	16	11
2018	7	16	23	4	19	0	19	8
2019	7	17	24	4	22	0	22	5
2020	7	17	24	4	29	0	29	(1)
2021	7	17	24	4	30	0	30	(2)
2022	7	17	24	4	31	0	31	(3)
2023	7	17	24	4	32	0	32	(4)
2024	7	17	24	4	33	0	33	(4)
2025	7	17	25	4	34	0	34	(5)
2026	7	17	25	4	35	0	35	(6)
2027	7	18	25	4	36	0	36	(7)
2028	7	18	25	4	37	0	37	(8)
2029	7	18	25	4	37	0	37	(9)
2030	7	18	25	4	38	0	38	(9)
2031	7	18	25	4	39	0	39	(10)
2032	7	18	25	4	40	0	40	(11)
2033	7	18	25	4	41	0	41	(12)
2034	7	18	25	4	42	0	42	(13)
2035	7	18	25	4	43	0	43	(14)
2036	7	18	25	4	43	0	43	(14)
2037	7	18	25	4	44	0	44	(15)
2038	7	18	25	4	45	0	45	(16)
2039	7	18	25	4	46	0	46	(17)
2040	7	18	25	4	47	0	47	(18)

3. Water Rate Increase
   - **a.** For every 10% increase, estimated savings could be 2% of utility total demand.
   - **b.** Approximately 6 MG of savings per year with current demand
   - **c.** Savings is cumulative and based on more than one source[19] (U.S. EPA, 1998; Whitcomb, 1999)
   - **d.** See Table 6-3 for potential savings from this measure compared with the utility's conservation goals.

[19] We estimate 2% demand reduction with 10% increase in price on a targeted customer class. By applying a ratio, we can determine the savings for lower or higher percentage increases.

Table 6-3. Current Savings + Potential Savings from 10% Water Rate Increase (MG).

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Potential Savings from Water Rate Increase	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)
2016	7	16	23	6	16	0	16	13
2017	7	16	23	6	16	0	16	13
2018	7	16	23	6	19	0	19	10
2019	7	17	24	6	22	0	22	7
2020	7	17	24	6	29	0	29	1
2021	7	17	24	6	30	0	30	0
2022	7	17	24	6	31	0	31	(1)
2023	7	17	24	6	32	0	32	(2)
2024	7	17	24	6	33	0	33	(2)
2025	7	17	25	6	34	0	34	(3)
2026	7	17	25	6	35	0	35	(4)
2027	7	18	25	6	36	0	36	(5)
2028	7	18	25	6	37	0	37	(6)
2029	7	18	25	6	37	0	37	(7)
2030	7	18	25	6	38	0	38	(8)
2031	7	18	25	6	39	0	39	(8)
2032	7	18	25	6	40	0	40	(9)
2033	7	18	25	6	41	0	41	(10)
2034	7	18	25	6	42	0	42	(11)
2035	7	18	25	6	43	0	43	(12)
2036	7	18	25	6	43	0	43	(13)
2037	7	18	25	6	44	0	44	(13)
2038	7	18	25	6	45	0	45	(14)
2039	7	18	25	6	46	0	46	(15)
2040	7	18	25	6	47	0	47	(16)

4. Rain Barrels
   a. In Region K, utilities could save approximately 22.4 gallons per year per gallon of capacity rebated, sold, or distributed (GDS Associates, 2002).
   b. Estimated 10-year useful life for most barrels

Statewide Water Conservation Quantification Project
City of Pflugerville Report • 2017

1 Introduction

In Texas' 2017 State Water Plan, municipal water conservation is projected to meet 9.6 percent[1] of the state's future water needs by 2070. According to the 16 regional water plans that comprise the state water plan, this is expected to be achieved through a variety of measures such as installation of water efficient plumbing fixtures, water conservation pricing structures, water system audits, landscape irrigation ordinances, as well as other water conservation activities. The 9.6 percent is "in addition to the estimated share of future passive conservation savings from plumbing codes and water efficiency standards, which are embedded in municipal water demand projections" (Texas Water Development Board, 2017).

In 2015, the Texas Legislature appropriated funds to the Texas Water Development Board (TWDB) to fund a research project principally charged with quantitatively determining the savings of municipal water conservation activities being implemented in relation to the recommended conservation goals (supply volumes) in the State Water Plan. As part of the project, individual reports were completed for all participating utilities.

With this report, utilities will benefit by receiving a clear and concise picture of its water conservation goals alongside estimated savings from quantifiable activities. In the event that current activity savings may not be able to reach long-term goals, this report offers suggestions on how utilities can reach water conservation goals with activities that are effective, easily adopted, have widespread appeal, and are quantifiable.

2 Municipal Conservation Terminology and Review of Methodology Used by Regional Planners

To make use of the results of this study, it is important to understand several key terms used in the water planning process.

What is a water user group?

In this report, a water user group (WUG) refers to a retail water provider in the form a city, municipal utility district, water control and improvement district, special utility district, water supply corporation, fresh water supply district, or other type of water utility. The TWDB further defines WUGs as one of the following (Texas Water Development Board, 2016b):

- Cities and towns with a population of 500 or more
- Non-city utilities providing more than 280 acre-feet per year per year of water for municipal use
- Collective reporting units (CRUs) consisting of grouped utilities having a common association

[1] Equal to 811,224 acre-feet per year in conservation savings.

- County-Wide WUGs:
    - County-Other (Rural/unincorporated areas of municipal water use)
    - Manufacturing
    - Steam electric power generation

What is a recommended water management strategy?

A recommended water management strategy (WMS) is a measure that will help ensure WUGs have adequate water supplies for their end users well into the future. WMS examples include river diversions, groundwater use, reservoir and aquifer development, and irrigation conservation. When WMS is referred to in this report, it refers only to municipal conservation, which may include water loss reduction as a part of the same strategy.

What is a WMS supply volume?

A WMS supply volume is the amount of water that a given strategy is expected to yield each decade in the planning period if carried out by the WUG. In this report, a WMS supply volume is the amount of water recommended to come from municipal water conservation.

Some regional water plans separate this strategy's supply volume into a volume for municipal water conservation and a volume for water loss reduction for each decade. The total strategy supply volume is the sum of both. A regional water plan may also refer to "advanced conservation" as part of this strategy. Advanced conservation usually indicates that the volume could be achieved through a more robust mix of conservation activities described in the plan.

2.1 Regional Planning Group Approach to Determining Supply Volumes

Each regional water planning group (RWPG) is responsible for producing its own individual plan that, if executed, will provide sufficient water to its WUGs throughout a 50-year planning period. These plans are completed in five-year cycles, with the most recent edition being completed in 2016. The 2016 regional plans make up the 2017 State Water Plan, which sets out WMS supply volumes for the years 2020 through 2070.

The decadal WMS supply volumes for municipal conservation were established by each of the RWPGs in much the same manner. The RWPGs generally followed the guidelines of the Texas Legislature's Water Conservation Implementation Task Force on the pace utilities should target to reduce gallons per capita per day (GPCD)[2] consumption levels.

The targeted reductions used by most regions follow this formula:

- For municipal WUGs with water use of 140 GPCD and greater, the goal is to reduce per capita water use by one percent per year until the level of 140 GPCD is reached,

[2] Regional water planning GPCD is defined as the annual volume of water pumped, diverted, or purchased minus the volume exported (sold) to other water systems or large industrial facilities divided by the permanent resident population of the Municipal Water User Group in the regional water planning process divided by 365. Saline and reused/recycled water are not included in this volume (Texas Water Development Board, 2012).

after which, the goal is to reduce per capita water use by one-fourth percent per year for the remainder of the planning period (Texas Water Development Board, 2016j).

The yearly reductions in GPCD for a given WUG are then converted into recommended supply volumes in acre-feet per year for each decade as the reductions in consumption continue. Some regions reduce GPCD by slightly different percentages before and after the 140 GPCD threshold, some do not apply further reductions in GPCD for WUGs once they reach 140 GPCD, while others recommend only "advanced conservation" activities once WUGs meet 140 GPCD.

2.2 Methodology

In order to complete a uniform quantification process, the first engagement was with utilities that agreed to participate and collected as much relevant data as possible. These data included, among many others, historical GPCD consumption figures, advanced metering infrastructure (AMI) specifications, and detailed feedback on each conservation activity being implemented. Personal interviews focused on determining when and to what extent these activities were being employed, as well as assessing plans to continue such conservation. Examples of frequently implemented activities include tiered water rate conservation pricing, strategic water rate increases, outdoor irrigation audits and ordinances, and rain barrel distribution.

Subsequently, each utility's conservation activities were quantified through several different means, including evidence-based studies, utility field results and savings determinations, manufacturer guarantees, water loss audits, TWDB studies, and other information that assigned a savings value to the activity's implementation.

Every conservation activity studied and quantified has a gallons-per-year estimate, useful life, and decay rate (if applicable) associated with it. Some activities' savings are projected to grow as demand grows over time, while some savings are constant each year and subside once useful life has run its course. For expanded methodology and details on studies and formulas used to determine activity savings, refer to Section 6 of the State Report included as part of this document.

Once analyzed, the resulting savings estimates from each utility were compared with the recommended WMS supply volumes in its respective regional plan to determine if the savings met, exceeded, or fell short of those volumes. Individual utility savings were aggregated to compare with regional volumes, and regional savings were aggregated to compare with state volumes.

It is important to note that this report quantified activity savings—not including water loss reduction—for the WMS supply volume comparison dating back to 2012. The reason for this is, with a few exceptions, the regional planners used 2011 as the base year for establishing potential WMS supply volumes.[3] In addition, any conservation savings achieved through 2011 are assumed to be accounted for in the regional water planning GPCD for that year.[4] Thus, quantifying from 2012 and forward is the most accurate way to determine if utilities are meeting

[3] Confirmed via personal communication with Region C, H, K, and L Plan consultants.
[4] It was established with TWDB planning staff that 2011 GPCD levels were chosen because they represented the most current water use and conservation patterns at the time.

the recommended conservation volumes in the regional plans. This assumption is by no means 100 percent accurate, however. Some previously implemented activities' savings persist into future years beyond this starting point, while some activities' savings have ceased. One year's GPCD will not necessarily include all savings yielded by conservation activities that came before it, but the quantification assessment must have a starting point.

2.3 Quantifiable Savings

The key to the project being useful and reliable is that the results from year to year are measurable. Quantifying conservation activities that can be accurately measured provides greater certainty and better planning for all stakeholders.

While many utilities are engaged in a variety of conservation activities, not all can currently be properly measured. Some examples of these activities include education initiatives, website and social media engagement, and enforcement for water waste. That does not mean these measures are not essential. Education of consumers, for example, is a fundamental activity that makes all others effective, but little hard data exists to quantify the results of education alone.

In addition, the work of conservation coordinators can have a particularly significant effect on the savings of all other activities, but the specific savings attributed to that staff role is difficult to quantify.

3 Results

This report compares Pflugerville's current water conservation activities and their quantified savings to two metrics: 1) Region K Water Plan's (Texas Water Development Board, 2016i) recommended WMS supply volumes for municipal conservation, and 2) Pflugerville's own 5- and 10-year goals as established in its most recent water conservation plan submitted to the TWDB.

The WMS supply volumes for municipal water conservation are laid out by decade (2020 – 2070) in the regional water plans to serve as benchmarks for what each utility could achieve via that strategy during a 50-year planning period.[5]

The 5- and 10-year goals in Pflugerville's most recent water conservation plan are established by the utility as realistic targets for reducing consumption over that timeframe. These reductions[6] are expressed in decreasing total GPCD [7] consumption and water loss GPCD.[8] [9]

---

[5] Some regional water plans separate this strategy volume into a volume for water conservation and a volume for water loss reduction for each decade. The total strategy volume is the sum of both.

[6] Occasionally, some utilities expect consumption to increase due to various reasons, such as an incoming industrial presence expected to raise consumption figures for the entire service area.

[7] As defined in TWDB water conservation plan annual report (Texas Water Development Board, 2016o): (Total Gallons in System ÷ Permanent Population) ÷ 365

[8] These plans also have targets for residential GPCD and water loss as a percentage (rather than GPCD), but this report does not address those goals.

[9] As defined in TWDB water conservation plan annual report (Texas Water Development Board, 2016o): (Total Water Loss ÷ Permanent Population) ÷ 365

The estimated savings in Tables 3-1 through 3-3 indicate the best information available as provided by utility staff. Some ongoing activities may not be known and are within a utility's service area are implemented on a micro-scale that may not be quantified. Individual households and businesses may be implementing conservation measures that are unknown and therefore cannot be included in the report.

Explanation of approach to assessing water loss reduction savings

Water loss reduction savings are defined as the volume of water participating utilities are realizing from their water loss mitigation efforts. For this report, this value is the difference between each individual utility's baseline[10] for water loss GPCD and its most recent water loss GPCD reported in 2015 water loss audits on file with TWDB. Savings from all water loss reduction efforts—including pipe replacements and leak repair—are assumed to be included in this comparison to a utility's baseline.

Note that because a single year (2015) value was used for comparison, it is possible that the 2015 value could be anomalous due to a number of events that may have occurred that year, such as a water main break, a particularly wet year, or a robust effort by the utility to curtail water loss. This will distort future savings figures that were carried forward in the study because water loss will inevitably increase or decrease in later years.

Ideally, using a rolling five-year average in the calculation would correct such anomalies. However, there was insufficient data to do that for every utility. The approach was to use the most complete water loss data possible, which was represented by the 2015 water loss audit. This problem will be further minimized, as continued data collection will allow five-year averages to be calculated for a majority of utilities.

In this way, water loss savings estimates are different from all other activity savings estimates in the project. Whether savings were positive or negative depended on where individual utilities established their own baselines or where their five-year average started, and what water loss GPCD value was reported in 2015.

3.1 Current Savings Compared to Conservation WMS Supply Volume (in Million Gallons) in Regional Water Plan

Table 3-1 shows the 2070 outlook for Pflugerville with the utility's yearly recommended WMS supply volume in million gallons (MG) alongside its water savings from implemented activities, including from water loss reduction. These activities and their associated savings are covered in greater detail in Sections 4 and 5.

Starting in 2015, this table compares all quantified conservation activity and the recommended conservation WMS supply volume for the planning period. The following definitions pair with the column headers in Table 3-1.

Actual Current Conservation Activity Savings – All quantified activities currently being

[10] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.

performed by the utility, *excluding* savings from water loss reduction. The regional planners used 2011 GPCD as the baseline for determining future conservation WMS supply volumes, therefore the study quantifies utility savings starting in 2012 for this comparison. The summary of these savings can be referenced in Table 5-1.

Actual Water Loss Reduction Savings (as of 2015) – The difference between the baseline[11] for water loss GPCD and most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB. [12] The summary of these savings can be referenced in Table 5-2.

Total Savings from All Conservation Activity – Actual Current Conservation Activity Savings plus Actual Water Loss Reduction Savings (as of 2015).

Conservation WMS Volume – The recommended municipal water conservation supply volume in the regional plan for the decades ranging from 2020 to 2070. These volumes are converted to MG from the values listed in the plan in acre-feet and then calculated in annual increments.

Water Loss Reduction WMS Volume – Some regional water plans have a separate WMS volume for water conservation and for water loss reduction for each decade. If a WUG's regional plan has a WMS volume for water loss reduction, this column will have values other than zero.

Total Yearly WMS Volume – The sum of the Conservation WMS Volume and Water Loss Reduction WMS Volume.

Over (Short) – The amount that the utility's Total Savings from All Conservation Activity (since 2012), is over or below the Total Yearly WMS Volume in the regional water plan. If the amount falls below the WMS volume, it will appear in parentheses.

[11] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.
[12] If water loss GPCD has increased from the utility's baseline or historic five-year average to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount.

Table 3-1. Current Savings Compared to Conservation WMS Supply Volume (MG) in Regional Water Plan.

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)
2015	366	0	366	87	0	87	279

3.2 Utility Water Conservation Plan Goals – Total GPCD

Table 3-2 shows how Pflugerville's quantified savings from its implemented activities compare with 5- and 10-year goals established in its individual water conservation plan submitted to the TWDB. The following definitions pair with the column headers in Table 3-2.

Utility Population – Estimated utility service area population for the years indicated.

Total GPCD Goals – Total GPCD goals start with the utility's baseline[13] for total GPCD and progress in subsequent years to match 5- and 10-year goals indicated in a utility's five-year water conservation plan on file with the TWDB. The first five annual GPCD goals were developed by spreading the difference between the baseline and five-year goal evenly over five years. The second five annual GPCD goals spread the difference between the five-year goal and 10-year goal evenly over the next five years.

Annual Savings Goal with Reduction in GPCD (MG) – This column shows what reductions from the baseline GPCD would yield in terms of volume each year as more water is saved. The volumes indicated here are what target GPCD goals look like expressed in million gallons. Annual volumes were derived using the formula: (baseline total GPCD – target total GPCD for that year) x 365 days ÷ 1,000,000 gallons.

Total Savings for All Current Quantified Activities (MG) – Total quantified savings for all current conservation activities and savings from water loss reduction. Refer to Tables 5-1 and 5-2 for details on these savings.

Over (Short) – The amount that the utility's total quantified savings for all current conservation activities (since 2012), including water loss reduction, is over or below the volume represented by reductions in GPCD each year. If the quantified savings are less than these target volumes, the value will appear in parentheses.

Table 3-2. Utility Water Conservation Plan Goals — Total GPCD.

Year #	Year	Utility Population	Total GPCD Goals	Annual Savings Goal with Reduction in GPCD (MG)	Total Savings for All Current Quantified Activities (MG)	Over (Short) (MG)
0	**Baseline**	-	119	0	0	0
1	2015	57,122	118	25	366	341
2	2016	61,200	117	54	381	328
3	2017	65,278	115	86	395	309
4	2018	69,356	114	122	409	288
5-year Goal	2019	73,434	113	161	423	262
6	2020	77,512	112	204	437	233
7	2021	80,259	111	246	451	205
8	2022	83,006	109	291	465	174
9	2023	85,753	108	338	479	141
10-year Goal	2024	88,500	107	388	493	105

[13] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for total GPCD from the utility's most recently submitted five-year water conservation plan was used.

3.3 Utility Water Conservation Plan Goals – Water Loss GPCD

Table 3-3 shows how Pflugerville's most recent water loss audit compares with 5- and 10-year water loss goals in its water conservation plan. The following definitions pair with the column headers in Table 3-2.

Utility Population – Estimated utility service area population for the years indicated.

Water Loss GPCD Goals – Water loss GPCD goals start with the utility's baseline[14] for water loss GPCD and progress in subsequent years to match 5- and 10-year water loss goals indicated in a utility's five-year water conservation plan on file with the TWDB. The first five annual GPCD goals were developed by spreading the difference between the baseline and five-year goal evenly over five years. The second five annual GPCD goals spread the difference between the five-year goal and 10-year goal evenly over the next five years.

Yearly Savings Goal with Reduction in GPCD (MG) – This column shows what reductions from the baseline water loss GPCD would yield in terms of volume each year as more water is saved. The volumes indicated here are what target water loss GPCD goals look like expressed in million gallons. Annual volumes were derived using the formula: (baseline water loss GPCD – target water loss GPCD for that year) x 365 days ÷ 1,000,000 gallons.

Total Savings from Water Loss Reduction (MG) – The difference between a utility's established baseline for water loss GPCD and the most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB. If water loss GPCD has increased from the utility's baseline to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount. Reference Table 5-2 for savings from water loss reduction.

Over (Short) – The amount that the utility's total savings from water loss reduction is over or below the volume represented by reductions in GPCD each year. If water loss reduction savings are less than these target volumes, the value will appear in parentheses.

Table 3-3. Utility Water Conservation Plan Goals — Water Loss GPCD.

Year #	Year	Utility Population	Water Loss GPCD Goals	Yearly Savings Goal with Reduction in GPCD (MG)	Total Savings from Water Loss Reduction (MG)	Over (Short) (MG)
0	**Baseline**	-	4.00	0	0	0
1	2015	57,122	4.40	(8)	0	8
2	2016	61,200	4.80	(18)	0	18
3	2017	65,278	5.20	(29)	0	29
4	2018	69,356	5.60	(41)	0	41
5-year Goal	2019	73,434	6.00	(54)	0	54
6	2020	77,512	5.80	(51)	0	51
7	2021	80,259	5.60	(47)	0	47
8	2022	83,006	5.40	(42)	0	42
9	2023	85,753	5.20	(38)	0	38
10-year Goal	2024	88,500	5.00	(32)	0	32

[14] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.

4 Implemented Activities

Below is a list of completed activities with estimated water savings. Note that drought response and other measures are not included in the utility's water savings because they are temporary, awareness-based or not able to be accurately quantified on an annual basis.

These are not savings projections of potential future activities. Estimated savings are based on measures that have actually been implemented. If savings are shown to persist in future years, it is because the measure is permanent, such as an ordinance, or the savings are assumed to continue for the reason listed under the itemized activity. Estimated savings from water rate increases are the one exception to these conditions.

Water Rate Increases

Savings from water rate increases were included because entities such as the U.S. Environmental Protection Agency and others indicate specific savings for utilities that raise rates (Texas Water Development Board, 2013; U.S. E.P.A., 1998; Whitcomb, 1999). This project includes surveys of several utilities that have minimal education efforts, perform no other substantive conservation activities, and yet experienced significant demand reduction that coincided with rate increases. In those cases, savings estimates matched up closely with decreases in total GPCD. For many smaller utilities, especially those with customers lacking disposable income, this measure is the only tool used to conserve other than water loss reduction.

The following assumptions were made for water rate increases:

- The model assumes that savings persist into future years because it is expected that the utility will continue to make periodic rate increases in line with the percentage increases from previous years.
- Only the last two rate increases for a utility were quantified.
- Savings grow with demand because as new customers enter the service area, they are assumed to adhere to the same price elasticity model estimates.
- A weighted average for savings was used when rate increases differed between residential and industrial-commercial-institutional (ICI) customers based on the individual utility's customer class breakdown.
- When a utility raised rates using tiered rate conservation pricing, a 50/50 savings split was used when increases differed between base and volumetric rates.
    - The reasoning is that all customers must react to the base increase, yet the pricing signal is stronger when volumetric rate increases affect the higher usage customers.
    - The 50/50 split is reasonable because many customers will not reach the higher volumetric tiers.
    - Studies show that most customers do not actually know they have reached the higher volumetric tiers; just that their bill has increased (Texas Water Development Board, 2013).

4.1 Itemized Activities

1. **Utility Website**
    a. Easy-to-use website with conservation tips and water rates
    b. Features contact information for Public Works staff and customer service

2. **Continuing Public Education**
    a. The utility engages the public in many ways including:
        i. Brochures, bill messages, displays, and exhibits

3. **Water Loss Reduction Savings**[15]
    a. Savings of 0 MG annually in 2015
    b. Water loss reduction savings = the difference between a utility's baseline[16] water loss GPCD submitted in its most recent 5-year water conservation plan and its most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB
    c. If water loss GPCD has increased from the utility's baseline or historic 5-year average to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount.
    d. All savings estimates grow each year at the same rate population figures for the utility grow in the regional water plan.

4. **Water Rate Increase**
    a. Last rate increase:[17]
        i. 13.0% increase in 2014
    b. Estimated customer demand reduction of 2.6%
    c. Savings is cumulative and based on more than one source[18] (U.S. EPA, 1998; Whitcomb, 1999)
    d. Savings from rate increases are shown to persist over time, however, note that savings from these pricing signals will likely decrease if rates remain the same in future years.

5. **Twice-a-week Outdoor Watering Restriction Ordinance**
    a. Estimated savings of 7.37% of total utility demand (Hermitte and Mace, 2012; Sierra Club-Lone Star Chapter and the National Wildlife Federation, 2015)
    b. All savings estimates grow each year at the same rate demand figures for the utility grow in the regional water plan.

---

[15] If current water loss levels exceed a utility's baseline, this value is treated as a deduction from total quantified savings.

[16] In the absence of having a baseline figure provided in the utility's most recently submitted 5-year water conservation plan, the historic 5-year average for water loss GPCD in the plan was used.

[17] Correspondence with utility staff.

[18] The study estimates a 2% demand reduction with 10% increase in price on a targeted customer class. By applying a ratio, it is possible to determine the savings for lower or higher percentage increases.

6. **Rain Barrels**
    a. Approximately 300 50- and 54-gallon barrels distributed from 2013 – 2016
    b. In Region K, estimated savings of 22.4 gallons per year per gallon of capacity rebated, sold, or distributed (GDS Associates, 2002).
    c. Estimated 10-year useful life for most barrels

7. **Valve-type HE Toilet Rebate (ICI)**
    a. 433 toilets replaced from 2012 – 2013
    b. Estimated 13,000 gallons per year per toilet (A&N Technical Services, 2005)
    c. 20-year useful life for fixture[19]

8. **Showerhead Distribution (SF)**
    a. Approximately 1,420 showerheads replaced since 2011
    b. Estimated 2,050 gallons per year per showerhead (A&N Technical Services, 2005)
    c. 5-year useful life
        i. If distributed after 2009, plumbing code will require that replacement is equally as efficient, so savings will carry forward indefinitely

9. **HE Toilet Rebate (MF)**
    a. 817 toilets replaced in 2011
    b. Estimated 15,756 gallons per year per toilet (A&N Technical Services, 2005)
    c. 20-year useful life for fixture[20]

10. **Outdoor Landscape Evaluations (SF)**
    a. 169 outdoor evaluations performed from 2012 – 2016
    b. Estimated 8,000 gallons per year for each system evaluation (A&N Technical Services, 2005; Whitcomb, 2000)
        i. Assumed 75% savings from typical indoor and outdoor survey when only outdoor watering is evaluated
    c. Approximately 22 gallons per day
    d. Greater savings during peak periods
    e. Lesser savings during off-peak periods
    f. 20% decay rate per year attributed to customer behavior (A&N Technical Services, 2005)

11. **Low-flush Urinal Replacement Program (ICI)**
    a. 166 urinals replaced with 1/2 gallon-per-flush model
    b. Estimated 6,200 gallons per year per toilet (A&N Technical Services, 2005)
    c. 20-year useful life for fixture[21]

---

[19] Plumbing code and efficiency standards effectively make the savings permanent, as new high-efficiency models will replace these toilets.
[20] Plumbing code and efficiency standards effectively make the savings permanent, as new high-efficiency models will replace these toilets.
[21] Plumbing code and efficiency standards effectively make the savings permanent, as new high-efficiency models will replace these toilets.

12. Drop-by-Drop Program

a. Not quantified at this time.

5 Summary of Savings

Table 5-1. Savings by Water Conservation Activity (MG).

Year	Rain Barrels	Water Rate Increase	1/2 Gal. Flush Urinals (ICI)	Valve-type HE Toilets (ICI)	2x Watering Ordinance	Outdoor Residential Surveys (SF)	HE Toilets (MF)	Low Flow Showerheads (SF)	TOTAL SAVINGS

6 Suggested Activities

Up to four activities were chosen as potential suggested activities for individual reports. These activities are: AMI system with customer portal, twice-per-week (or less) outdoor watering ordinances, strategic water rate increases, and rain barrels.

Activities were chosen because they are:

- Achievable
- Prevalence of vendors that can actually implement them
- Acceptability to city councils, MUD boards, et al.
- Easily adopted
- Cost effective
- Yield high savings relative to cost

AMI systems with customer engagement portals were also chosen because they represent a profusion of future applications that will undoubtedly continue to advance conservation efforts. AMI and meter data management (MDM) companies are developing new and innovative ways to benefit water providers, customers, and ultimately states that are pushing conservation and usage analytics further.

Each utility should be cognizant of the potential impact that these suggested activities may have on its own unique rate and revenue situation.

Benefits to consider:

- Avoided water supply and wastewater costs
    - o The higher water purchase, transmission, and distribution costs are, the greater the potential benefit realized when large amounts of water are conserved with these activities.
- Avoided system expansion costs

- o Conserving water may allow a utility to postpone building new system capacity by decreasing demand even as population grows.

Costs to consider:

- Staff time and resources
- Unit cost per unit saved
- Implementation costs
- Stakeholder agreement and support
- Other overhead and budget considerations

6.1 Suggested Activities with Savings Estimates

1. Advanced Metering Infrastructure with Customer Engagement Portal

These portals, along with mobile applications and billing statements, can provide customers with much more access to their water use data in simple and compelling formats. This access and comparison with other customers' usage can reduce water use through changed behavior, as well as provide an opportunity for other conservation programs to be offered to the customer for increased adoption and additional savings. AMI systems support leak notification and web portals with real-time data. Any water loss reduction savings that these systems also yield were included in the water loss assessment of individual reports for this project.

- **a.** Specific utility results will vary based on portal features and frequency of customer notifications
- **b.** Potential savings estimate assumes 20% of residential customers will use and save water due to the portal (Westin Engineering, 2015)
- **c.** Estimate assumes customers will save 10% of total annual use due to the portal
    - i. Savings estimate of 10% is an average of results from multiple studies (Chesnutt and Mitchell, 2013; East Bay Municipal Utility District, 2014; IBM, 2011; Texas A&M and Texas Water Resources Institute, 2016; Westin Engineering, 2015)
- **d.** Residential customers' use assumed to make up approximately 67% of all retail customers' use based on utility profile information submitted to the TWDB
    - i. This was the most common percentage of residential use among participating utilities in this project.
    - ii. Actual customer class demand percentages will vary by utility.
- **e.** 20% of residential customers saving 10% with this customer class breakdown amounts to 1.34% of total demand
- **f.** Savings are assumed to increase along with demand as connections increase each year[22]

[22] The 10% consumption reduction figure for 20% of residential customers is conservative, but savings could be greater when monitored yearly as customer engagement increases.

g. See Table 6-1 for potential savings from this measure compared with the utility's WMS supply volumes targets.

Table 6-1. Current Savings + Potential Savings from AMI with Customer Portal (MG).

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Potential Savings from AMI with Customer Portal	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)

Statewide Water Conservation Quantification Project
Travis County WCID #17 Report • 2017

1 Introduction

In Texas' 2017 State Water Plan, municipal water conservation is projected to meet 9.6 percent[1] of the state's future water needs by 2070. According to the 16 regional water plans that comprise the state water plan, this is expected to be achieved through a variety of measures such as installation of water efficient plumbing fixtures, water conservation pricing structures, water system audits, landscape irrigation ordinances, as well as other water conservation activities. The 9.6 percent is "in addition to the estimated share of future passive conservation savings from plumbing codes and water efficiency standards, which are embedded in municipal water demand projections" (Texas Water Development Board, 2017).

In 2015, the Texas Legislature appropriated funds to the Texas Water Development Board (TWDB) to fund a research project principally charged with quantitatively determining the savings of municipal water conservation activities being implemented in relation to the recommended conservation goals (supply volumes) in the State Water Plan. As part of the project, individual reports were completed for all participating utilities.

With this report, utilities will benefit by receiving a clear and concise picture of its water conservation goals alongside estimated savings from quantifiable activities. In the event that current activity savings may not be able to reach long-term goals, this report offers suggestions on how utilities can reach water conservation goals with activities that are effective, easily adopted, have widespread appeal, and are quantifiable.

2 Municipal Conservation Terminology and Review of Methodology Used by Regional Planners

To make use of the results of this study, it is important to understand several key terms used in the water planning process.

What is a water user group?

In this report, a water user group (WUG) refers to a retail water provider in the form a city, municipal utility district, water control and improvement district, special utility district, water supply corporation, fresh water supply district, or other type of water utility. The TWDB further defines WUGs as one of the following (Texas Water Development Board, 2016b):

- Cities and towns with a population of 500 or more
- Non-city utilities providing more than 280 acre-feet per year per year of water for municipal use
- Collective reporting units (CRUs) consisting of grouped utilities having a common association

[1] Equal to 811,224 acre-feet per year in conservation savings.

- County-Wide WUGs:
    - County-Other (Rural/unincorporated areas of municipal water use)
    - Manufacturing
    - Steam electric power generation

What is a recommended water management strategy?

A recommended water management strategy (WMS) is a measure that will help ensure WUGs have adequate water supplies for their end users well into the future. WMS examples include river diversions, groundwater use, reservoir and aquifer development, and irrigation conservation. When WMS is referred to in this report, it refers only to municipal conservation, which may include water loss reduction as a part of the same strategy.

What is a WMS supply volume?

A WMS supply volume is the amount of water that a given strategy is expected to yield each decade in the planning period if carried out by the WUG. In this report, a WMS supply volume is the amount of water recommended to come from municipal water conservation.

Some regional water plans separate this strategy's supply volume into a volume for municipal water conservation and a volume for water loss reduction for each decade. The total strategy supply volume is the sum of both. A regional water plan may also refer to "advanced conservation" as part of this strategy. Advanced conservation usually indicates that the volume could be achieved through a more robust mix of conservation activities described in the plan.

2.1 Regional Planning Group Approach to Determining Supply Volumes

Each regional water planning group (RWPG) is responsible for producing its own individual plan that, if executed, will provide sufficient water to its WUGs throughout a 50-year planning period. These plans are completed in five-year cycles, with the most recent edition being completed in 2016. The 2016 regional plans make up the 2017 State Water Plan, which sets out WMS supply volumes for the years 2020 through 2070.

The decadal WMS supply volumes for municipal conservation were established by each of the RWPGs in much the same manner. The RWPGs generally followed the guidelines of the Texas Legislature's Water Conservation Implementation Task Force on the pace utilities should target to reduce gallons per capita per day (GPCD)[2] consumption levels.

The targeted reductions used by most regions follow this formula:

- For municipal WUGs with water use of 140 GPCD and greater, the goal is to reduce per capita water use by one percent per year until the level of 140 GPCD is reached,

[2] Regional water planning GPCD is defined as the annual volume of water pumped, diverted, or purchased minus the volume exported (sold) to other water systems or large industrial facilities divided by the permanent resident population of the Municipal Water User Group in the regional water planning process divided by 365. Saline and reused/recycled water are not included in this volume (Texas Water Development Board, 2012).

after which, the goal is to reduce per capita water use by one-fourth percent per year for the remainder of the planning period (Texas Water Development Board, 2016j).

The yearly reductions in GPCD for a given WUG are then converted into recommended supply volumes in acre-feet per year for each decade as the reductions in consumption continue. Some regions reduce GPCD by slightly different percentages before and after the 140 GPCD threshold, some do not apply further reductions in GPCD for WUGs once they reach 140 GPCD, while others recommend only "advanced conservation" activities once WUGs meet 140 GPCD.

2.2 Methodology

In order to complete a uniform quantification process, the first engagement was with utilities that agreed to participate and collected as much relevant data as possible. These data included, among many others, historical GPCD consumption figures, advanced metering infrastructure (AMI) specifications, and detailed feedback on each conservation activity being implemented. Personal interviews focused on determining when and to what extent these activities were being employed, as well as assessing plans to continue such conservation. Examples of frequently implemented activities include tiered water rate conservation pricing, strategic water rate increases, outdoor irrigation audits and ordinances, and rain barrel distribution.

Subsequently, each utility's conservation activities were quantified through several different means, including evidence-based studies, utility field results and savings determinations, manufacturer guarantees, water loss audits, TWDB studies, and other information that assigned a savings value to the activity's implementation.

Every conservation activity studied and quantified has a gallons-per-year estimate, useful life, and decay rate (if applicable) associated with it. Some activities' savings are projected to grow as demand grows over time, while some savings are constant each year and subside once useful life has run its course. For expanded methodology and details on studies and formulas used to determine activity savings, refer to Section 6 of the State Report included as part of this document.

Once analyzed, the resulting savings estimates from each utility were compared with the recommended WMS supply volumes in its respective regional plan to determine if the savings met, exceeded, or fell short of those volumes. Individual utility savings were aggregated to compare with regional volumes, and regional savings were aggregated to compare with state volumes.

It is important to note that this report quantified activity savings—not including water loss reduction—for the WMS supply volume comparison dating back to 2012. The reason for this is, with a few exceptions, the regional planners used 2011 as the base year for establishing potential WMS supply volumes.[3] In addition, any conservation savings achieved through 2011 are assumed to be accounted for in the regional water planning GPCD for that year.[4] Thus, quantifying from 2012 and forward is the most accurate way to determine if utilities are meeting

---

[3] Confirmed via personal communication with Region C, H, K, and L Plan consultants.
[4] It was established with TWDB planning staff that 2011 GPCD levels were chosen because they represented the most current water use and conservation patterns at the time.

the recommended conservation volumes in the regional plans. This assumption is by no means 100 percent accurate, however. Some previously implemented activities' savings persist into future years beyond this starting point, while some activities' savings have ceased. One year's GPCD will not necessarily include all savings yielded by conservation activities that came before it, but the quantification assessment must have a starting point.

2.3 Quantifiable Savings

The key to the project being useful and reliable is that the results from year to year are measurable. Quantifying conservation activities that can be accurately measured provides greater certainty and better planning for all stakeholders.

While many utilities are engaged in a variety of conservation activities, not all can currently be properly measured. Some examples of these activities include education initiatives, website and social media engagement, and enforcement for water waste. That does not mean these measures are not essential. Education of consumers, for example, is a fundamental activity that makes all others effective, but little hard data exists to quantify the results of education alone.

In addition, the work of conservation coordinators can have a particularly significant effect on the savings of all other activities, but the specific savings attributed to that staff role is difficult to quantify.

3 Results

This report compares Travis County WCID #17's current water conservation activities and their quantified savings to two metrics: 1) Region K Water Plan's (Texas Water Development Board, 2016i) recommended WMS supply volumes for municipal conservation, and 2) Travis County WCID #17's own 5- and 10-year goals as established in its most recent water conservation plan submitted to the TWDB.

The WMS supply volumes for municipal water conservation are laid out by decade (2020 – 2070) in the regional water plans to serve as benchmarks for what each utility could achieve via that strategy during a 50-year planning period.[5]

The 5- and 10-year goals in Travis County WCID #17's most recent water conservation plan are established by the utility as realistic targets for reducing consumption over that timeframe. These reductions[6] are expressed in decreasing total GPCD [7] consumption and water loss GPCD.[8] [9]

---

[5] Some regional water plans separate this strategy volume into a volume for water conservation and a volume for water loss reduction for each decade. The total strategy volume is the sum of both.

[6] Occasionally, some utilities expect consumption to increase due to various reasons, such as an incoming industrial presence expected to raise consumption figures for the entire service area.

[7] As defined in TWDB water conservation plan annual report (Texas Water Development Board, 2016o): (Total Gallons in System ÷ Permanent Population) ÷ 365

[8] These plans also have targets for residential GPCD and water loss as a percentage (rather than GPCD), but this report does not address those goals.

[9] As defined in TWDB water conservation plan annual report (Texas Water Development Board, 2016o): (Total Water Loss ÷ Permanent Population) ÷ 365

The estimated savings in Tables 3-1 through 3-3 indicate the best information available as provided by utility staff. Some ongoing activities may not be known and are within a utility's service area are implemented on a micro-scale that may not be quantified. Individual households and businesses may be implementing conservation measures that are unknown and therefore cannot be included in the report.

Explanation of approach to assessing water loss reduction savings

Water loss reduction savings are defined as the volume of water participating utilities are realizing from their water loss mitigation efforts. For this report, this value is the difference between each individual utility's baseline[10] for water loss GPCD and its most recent water loss GPCD reported in 2015 water loss audits on file with TWDB. Savings from all water loss reduction efforts—including pipe replacements and leak repair—are assumed to be included in this comparison to a utility's baseline.

Note that because a single year (2015) value was used for comparison, it is possible that the 2015 value could be anomalous due to a number of events that may have occurred that year, such as a water main break, a particularly wet year, or a robust effort by the utility to curtail water loss. This will distort future savings figures that were carried forward in the study because water loss will inevitably increase or decrease in later years.

Ideally, using a rolling five-year average in the calculation would correct such anomalies. However, there was insufficient data to do that for every utility. The approach was to use the most complete water loss data possible, which was represented by the 2015 water loss audit. This problem will be further minimized, as continued data collection will allow five-year averages to be calculated for a majority of utilities.

In this way, water loss savings estimates are different from all other activity savings estimates in the project. Whether savings were positive or negative depended on where individual utilities established their own baselines or where their five-year average started, and what water loss GPCD value was reported in 2015.

3.1 Current Savings Compared to Conservation WMS Supply Volume (in Million Gallons) in Regional Water Plan

Table 3-1 shows the 2070 outlook for Travis County WCID #17 with the utility's yearly recommended WMS supply volume in million gallons (MG) alongside its water savings from implemented activities, including from water loss reduction. These activities and their associated savings are covered in greater detail in Sections 4 and 5.

Starting in 2015, this table compares all quantified conservation activity and the recommended conservation WMS supply volume for the planning period. The following definitions pair with the column headers in Table 3-1.

Actual Current Conservation Activity Savings – All quantified activities currently being

[10] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.

performed by the utility, *excluding* savings from water loss reduction. The regional planners used 2011 GPCD as the baseline for determining future conservation WMS supply volumes, therefore the study quantifies utility savings starting in 2012 for this comparison. The summary of these savings can be referenced in Table 5-1.

Actual Water Loss Reduction Savings (as of 2015) – The difference between the baseline[11] for water loss GPCD and most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB. [12] The summary of these savings can be referenced in Table 5-2.

Total Savings from All Conservation Activity – Actual Current Conservation Activity Savings plus Actual Water Loss Reduction Savings (as of 2015).

Conservation WMS Volume – The recommended municipal water conservation supply volume in the regional plan for the decades ranging from 2020 to 2070. These volumes are converted to MG from the values listed in the plan in acre-feet and then calculated in annual increments.

Water Loss Reduction WMS Volume – Some regional water plans have a separate WMS volume for water conservation and for water loss reduction for each decade. If a WUG's regional plan has a WMS volume for water loss reduction, this column will have values other than zero.

Total Yearly WMS Volume – The sum of the Conservation WMS Volume and Water Loss Reduction WMS Volume.

Over (Short) – The amount that the utility's Total Savings from All Conservation Activity (since 2012), is over or below the Total Yearly WMS Volume in the regional water plan. If the amount falls below the WMS volume, it will appear in parentheses.

[11] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.
[12] If water loss GPCD has increased from the utility's baseline or historic five-year average to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount.

Table 3-1. Current Savings Compared to Conservation WMS Supply Volume (MG) in Regional Water Plan.

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)
2015	90.7	96	187	124	0	124	63

2069	130.0	137	267	1,471	0	1,471	(1,204)
2070	130.3	138	268	1,514	0	1,514	(1,246)

3.2 Utility Water Conservation Plan Goals – Total GPCD

Table 3-2 shows how Travis County WCID #17's quantified savings from its implemented activities compare with 5- and 10-year goals established in its individual water conservation plan submitted to the TWDB. The following definitions pair with the column headers in Table 3-2.

Utility Population – Estimated utility service area population for the years indicated.

Total GPCD Goals – Total GPCD goals start with the utility's baseline[13] for total GPCD and progress in subsequent years to match 5- and 10-year goals indicated in a utility's five-year water conservation plan on file with the TWDB. The first five annual GPCD goals were developed by spreading the difference between the baseline and five-year goal evenly over five years. The second five annual GPCD goals spread the difference between the five-year goal and 10-year goal evenly over the next five years.

Annual Savings Goal with Reduction in GPCD (MG) – This column shows what reductions from the baseline GPCD would yield in terms of volume each year as more water is saved. The volumes indicated here are what target GPCD goals look like expressed in million gallons. Annual volumes were derived using the formula: (baseline total GPCD – target total GPCD for that year) x 365 days ÷ 1,000,000 gallons.

Total Savings for All Current Quantified Activities (MG) – Total quantified savings for all current conservation activities and savings from water loss reduction. Refer to Tables 5-1 and 5-2 for details on these savings.

Over (Short) – The amount that the utility's total quantified savings for all current conservation activities (since 2012), including water loss reduction, is over or below the volume represented by reductions in GPCD each year. If the quantified savings are less than these target volumes, the value will appear in parentheses.

Table 3-2. Utility Water Conservation Plan Goals — Total GPCD.

Year #	Year	Utility Population	Total GPCD Goals	Annual Savings Goal with Reduction in GPCD (MG)	Total Savings for All Current Quantified Activities (MG)	Over (Short) (MG)
0	**Baseline**	-	170	0	0	0
1	2013	31,800	168	23	92	69
2	2014	32,400	166	47	92	45
3	2015	33,000	164	72	187	115
4	2016	33,023	162	96	189	92
5-year Goal	2017	33,047	160	121	189	68
6	2018	33,070	160	123	188	65
7	2019	33,094	160	126	189	64
8	2020	33,117	159	128	191	63
9	2021	33,779	159	133	195	61
10-year Goal	2022	34,442	159	138	198	60

[13] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for total GPCD from the utility's most recently submitted five-year water conservation plan was used.

3.3 Utility Water Conservation Plan Goals – Water Loss GPCD

Table 3-3 shows how Travis County WCID #17's most recent water loss audit compares with 5- and 10-year water loss goals in its water conservation plan. The following definitions pair with the column headers in Table 3-2.

Utility Population – Estimated utility service area population for the years indicated.

Water Loss GPCD Goals – Water loss GPCD goals start with the utility's baseline[14] for water loss GPCD and progress in subsequent years to match 5- and 10-year water loss goals indicated in a utility's five-year water conservation plan on file with the TWDB. The first five annual GPCD goals were developed by spreading the difference between the baseline and five-year goal evenly over five years. The second five annual GPCD goals spread the difference between the five-year goal and 10-year goal evenly over the next five years.

Yearly Savings Goal with Reduction in GPCD (MG) – This column shows what reductions from the baseline water loss GPCD would yield in terms of volume each year as more water is saved. The volumes indicated here are what target water loss GPCD goals look like expressed in million gallons. Annual volumes were derived using the formula: (baseline water loss GPCD – target water loss GPCD for that year) x 365 days ÷ 1,000,000 gallons.

Total Savings from Water Loss Reduction (MG) – The difference between a utility's established baseline for water loss GPCD and the most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB. If water loss GPCD has increased from the utility's baseline to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount. Reference Table 5-2 for savings from water loss reduction.

Over (Short) – The amount that the utility's total savings from water loss reduction is over or below the volume represented by reductions in GPCD each year. If water loss reduction savings are less than these target volumes, the value will appear in parentheses.

Table 3-3. Utility Water Conservation Plan Goals — Water Loss GPCD.

Year #	Year	Utility Population	Water Loss GPCD Goals	Yearly Savings Goal with Reduction in GPCD (MG)	Total Savings from Water Loss Reduction (MG)	Over (Short) (MG)
0	**Baseline**	-	21.00	0	0	0
1	2013	31,800	20.00	12	116	104
2	2014	32,400	19.00	24	59	35
3	2015	33,000	18.00	36	96	60
4	2016	33,023	17.00	48	96	48
5-year Goal	2017	33,047	16.00	60	96	36
6	2018	33,070	15.20	70	97	27
7	2019	33,094	14.40	80	97	17
8	2020	33,117	13.60	89	97	7
9	2021	33,779	12.80	101	99	(2)
10-year Goal	2022	34,442	12.00	113	101	(13)

[14] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.

4 Implemented Activities

Below is a list of completed activities with estimated water savings. Note that drought response and other measures are not included in the utility's water savings because they are temporary, awareness-based or not able to be accurately quantified on an annual basis.

These are not savings projections of potential future activities. Estimated savings are based on measures that have actually been implemented. If savings are shown to persist in future years, it is because the measure is permanent, such as an ordinance, or the savings are assumed to continue for the reason listed under the itemized activity. Estimated savings from water rate increases are the one exception to these conditions.

Water Rate Increases

Savings from water rate increases were included because entities such as the U.S. Environmental Protection Agency and others indicate specific savings for utilities that raise rates (Texas Water Development Board, 2013; U.S. E.P.A., 1998; Whitcomb, 1999). This project includes surveys of several utilities that have minimal education efforts, perform no other substantive conservation activities, and yet experienced significant demand reduction that coincided with rate increases. In those cases, savings estimates matched up closely with decreases in total GPCD. For many smaller utilities, especially those with customers lacking disposable income, this measure is the only tool used to conserve other than water loss reduction.

The following assumptions were made for water rate increases:

- The model assumes that savings persist into future years because it is expected that the utility will continue to make periodic rate increases in line with the percentage increases from previous years.
- Only the last two rate increases for a utility were quantified.
- Savings grow with demand because as new customers enter the service area, they are assumed to adhere to the same price elasticity model estimates.
- A weighted average for savings was used when rate increases differed between residential and industrial-commercial-institutional (ICI) customers based on the individual utility's customer class breakdown.
- When a utility raised rates using tiered rate conservation pricing, a 50/50 savings split was used when increases differed between base and volumetric rates.
    - The reasoning is that all customers must react to the base increase, yet the pricing signal is stronger when volumetric rate increases affect the higher usage customers.
    - The 50/50 split is reasonable because many customers will not reach the higher volumetric tiers.
    - Studies show that most customers do not actually know they have reached the higher volumetric tiers; just that their bill has increased (Texas Water Development Board, 2013).

4.1 Itemized Activities

1. **Utility Website**
    a. Easy-to-use website with conservation tips and water rates
    b. Features contact information for Public Works staff and customer service

2. **Continuing Public Education**
    a. The utility engages the public in many ways including:
        i. Brochures, bill messages, displays, and exhibits

3. **Water Loss Reduction Savings**[15]
    a. Savings of 96 MG annually in 2015
    b. Water loss reduction savings = the difference between a utility's baseline[16] water loss GPCD submitted in its most recent 5-year water conservation plan and its most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB
    c. If water loss GPCD has increased from the utility's baseline or historic 5-year average to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount.
    d. All savings estimates grow each year at the same rate population figures for the utility grow in the regional water plan.

4. **Twice-a-week Outdoor Watering Restriction Ordinance**
    a. Estimated savings of 3.27% of total utility demand (Hermitte and Mace, 2012; Sierra Club-Lone Star Chapter and the National Wildlife Federation, 2015)
        i. Measure is mandatory only during peak season
        ii. Conservatively estimated at 50% of full savings of a permanent, year-round ordinance with an enforcement scheme, which is has estimated savings of 6.53% of total demand in Region K
    b. All savings estimates grow each year at the same rate demand figures for the utility grow in the regional water plan.

5. **High Efficiency (HE) Toilet Replacement Program (SF)**
    a. 382 toilets replaced from 2010 – 2012
    b. Number of toilets per year provided by staff
    c. Estimated 10,390 gallons per year per toilet (A&N Technical Services, 2005)
    d. Savings carry on indefinitely because replacement toilet will be as efficient

6. **High Efficiency (HE) Toilet Replacement Program (MF)**
    a. 2 toilets replaced in 2012
    b. Number of toilets per year provided by staff
    c. Estimated 15,756 gallons per year per toilet (A&N Technical Services, 2005)

---

[15] If current water loss levels exceed a utility's baseline, this value is treated as a deduction from total quantified savings.

[16] In the absence of having a baseline figure provided in the utility's most recently submitted 5-year water conservation plan, the historic 5-year average for water loss GPCD in the plan was used.

d. Savings carry on indefinitely because replacement toilet will be as efficient

7. **Showerhead Distribution (SF)**
   a. 423 showerheads replaced from 2010 – 2012
   b. Number of showerheads per year provided by staff
   c. Estimated 2,050 gallons per year per showerhead (A&N Technical Services, 2005)
   d. 5-year useful life
      i. If distributed after 2009, plumbing code will require that replacement is equally as efficient, so savings will carry forward indefinitely

8. **Large Landscape Irrigation System Audits**
   a. 49 audits performed from 2010 – 2015
   b. Number of audits per year provided by staff
   c. Estimated savings of 164,500 gallons per year per audit
   d. Used EPA WaterSense Water Budget Tool Formula[17] with 87,120 sq. ft. as basis for large landscape hydrozone
   e. Savings assumed to last 5 years with no decay rate

9. **Outdoor Landscape Audits (SF)**
   a. 501 outdoor audits performed from 2010 – 2015
   b. Number of audits per year provided by staff
   c. Estimated 8,000 gallons per year for each system evaluation (A&N Technical Services, 2005; Whitcomb, 2000)
      i. Assumed 75% savings from typical indoor and outdoor survey when only outdoor watering is evaluated
   d. Approximately 22 gallons per day
   e. Greater savings during peak periods
   f. Lesser savings during off-peak periods
   g. 20% decay rate per year attributed to customer behavior (A&N Technical Services, 2005)

[17] $LWR_H = RTM\ [(ET_o \times K_L) - R_a] \times A \times C_u$

5 Summary of Savings

Table 5-1. Savings by Water Conservation Activity (MG).

Year	2x Watering Ordinance (Peak Season)	HE Toilets (SF)	HE Toilets (MF)	Tank Type HE Toilets (ICI)	Low Flow Showerheads (SF)	Residential Surveys (SF)	Large Landscape Surveys (ICI)	TOTAL SAVINGS

6 Suggested Activities

Up to four activities were chosen as potential suggested activities for individual reports. These activities are: AMI system with customer portal, twice-per-week (or less) outdoor watering ordinances, strategic water rate increases, and rain barrels.

Activities were chosen because they are:

- Achievable
- Prevalence of vendors that can actually implement them
- Acceptability to city councils, MUD boards, et al.
- Easily adopted
- Cost effective
- Yield high savings relative to cost

AMI systems with customer engagement portals were also chosen because they represent a profusion of future applications that will undoubtedly continue to advance conservation efforts. AMI and meter data management (MDM) companies are developing new and innovative ways to benefit water providers, customers, and ultimately states that are pushing conservation and usage analytics further.

Each utility should be cognizant of the potential impact that these suggested activities may have on its own unique rate and revenue situation.

Benefits to consider:

- Avoided water supply and wastewater costs
    - The higher water purchase, transmission, and distribution costs are, the greater the potential benefit realized when large amounts of water are conserved with these activities.
- Avoided system expansion costs

- Conserving water may allow a utility to postpone building new system capacity by decreasing demand even as population grows.

Costs to consider:

- Staff time and resources
- Unit cost per unit saved
- Implementation costs
- Stakeholder agreement and support
- Other overhead and budget considerations

6.1 Suggested Activities with Savings Estimates

1. Advanced Metering Infrastructure with Customer Engagement Portal

These portals, along with mobile applications and billing statements, can provide customers with much more access to their water use data in simple and compelling formats. This access and comparison with other customers' usage can reduce water use through changed behavior, as well as provide an opportunity for other conservation programs to be offered to the customer for increased adoption and additional savings. AMI systems support leak notification and web portals with real-time data. Any water loss reduction savings that these systems also yield were included in the water loss assessment of individual reports for this project.

a. Specific utility results will vary based on portal features and frequency of customer notifications

b. Potential savings estimate assumes 20% of residential customers will use and save water due to the portal (Westin Engineering, 2015)

c. Estimate assumes customers will save 10% of total annual use due to the portal

   i. Savings estimate of 10% is an average of results from multiple studies (Chesnutt and Mitchell, 2013; East Bay Municipal Utility District, 2014; IBM, 2011; Texas A&M and Texas Water Resources Institute, 2016; Westin Engineering, 2015)

d. Residential customers' use assumed to make up approximately 67% of all retail customers' use based on utility profile information submitted to the TWDB

   i. This was the most common percentage of residential use among participating utilities in this project.

   ii. Actual customer class demand percentages will vary by utility.

e. 20% of residential customers saving 10% with this customer class breakdown amounts to 1.34% of total demand

f. Savings are assumed to increase along with demand as connections increase each year[18]

[18] The 10% consumption reduction figure for 20% of residential customers is conservative, but savings could be greater when monitored yearly as customer engagement increases.

g. See Table 6-1 for potential savings from this measure compared with the utility's WMS supply volumes targets.

Table 6-1. Current Savings + Potential Savings from AMI with Customer Portal (MG).

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Potential Savings from AMI with Customer Portal	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)
2016	92	96	189	34	154	0	154	68
2017	92	96	189	35	154	0	154	69

2025	103	106	209	40	436	0	436	(187)
2026	104	108	213	41	468	0	468	(214)
2027	106	110	216	42	500	0	500	(241)
2028	108	112	220	43	531	0	531	(269)
2029	110	114	224	43	563	0	563	(296)
2030	111	116	227	44	595	0	595	(324)
2031	112	117	230	44	613	0	613	(340)
2032	113	118	232	45	632	0	632	(356)
2033	114	120	234	45	651	0	651	(372)
2034	115	121	236	46	670	0	670	(388)
2035	116	122	238	46	688	0	688	(404)
2036	117	123	240	46	707	0	707	(420)
2037	118	124	243	47	726	0	726	(436)
2038	120	125	245	47	744	0	744	(452)
2039	121	126	247	48	763	0	763	(468)
2040	122	128	249	48	782	0	782	(485)

2. Water Rate Increase

a. For every 10% increase, estimated savings could be 2% of utility total demand.

b. Approximately 51 MG of savings per year with current demand

c. Savings is cumulative and based on more than one source[19] (U.S. EPA, 1998; Whitcomb, 1999)

d. See Table 6-2 for potential savings from this measure compared with the utility's conservation goals.

[19] The study estimates a 2% demand reduction with 10% increase in price on a targeted customer class. By applying a ratio, it is possible to determine the savings for lower or higher percentage increases.

Table 6-2. Current Savings + Potential Savings from 10% Water Rate Increase (MG).

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Potential Savings from Water Rate Increase	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)
2016	92	96	189	51	154	0	154	85
2017	92	96	189	52	154	0	154	86
2018	92	97	188	53	185	0	185	56

2022	98	101	198	57	341	0	341	(86)
2023	99	103	202	58	373	0	373	(113)
2024	101	104	206	59	405	0	405	(140)
2025	103	106	209	60	436	0	436	(167)
2026	104	108	213	61	468	0	468	(194)
2027	106	110	216	62	500	0	500	(221)
2028	108	112	220	63	531	0	531	(248)
2029	110	114	224	64	563	0	563	(275)
2030	111	116	227	66	595	0	595	(302)
2031	112	117	230	66	613	0	613	(318)
2032	113	118	232	67	632	0	632	(334)
2033	114	120	234	67	651	0	651	(350)
2034	115	121	236	68	670	0	670	(365)
2035	116	122	238	69	688	0	688	(381)
2036	117	123	240	69	707	0	707	(397)
2037	118	124	243	70	726	0	726	(413)
2038	120	125	245	71	744	0	744	(429)
2039	121	126	247	71	763	0	763	(445)
2040	122	128	249	72	782	0	782	(461)

3. Rain Barrels
   a. In Region K, utilities could save approximately 22.4 gallons per year per gallon of capacity rebated, sold, or distributed (GDS Associates, 2002).
   b. Estimated 10-year useful life for most barrels

Statewide Water Conservation Quantification Project
West Travis County Public Utility Report • 2017

1 Introduction

In Texas' 2017 State Water Plan, municipal water conservation is projected to meet 9.6 percent[1] of the state's future water needs by 2070. According to the 16 regional water plans that comprise the state water plan, this is expected to be achieved through a variety of measures such as installation of water efficient plumbing fixtures, water conservation pricing structures, water system audits, landscape irrigation ordinances, as well as other water conservation activities. The 9.6 percent is "in addition to the estimated share of future passive conservation savings from plumbing codes and water efficiency standards, which are embedded in municipal water demand projections" (Texas Water Development Board, 2017).

In 2015, the Texas Legislature appropriated funds to the Texas Water Development Board (TWDB) to fund a research project principally charged with quantitatively determining the savings of municipal water conservation activities being implemented in relation to the recommended conservation goals (supply volumes) in the State Water Plan. As part of the project, individual reports were completed for all participating utilities.

With this report, utilities will benefit by receiving a clear and concise picture of its water conservation goals alongside estimated savings from quantifiable activities. In the event that current activity savings may not be able to reach long-term goals, this report offers suggestions on how utilities can reach water conservation goals with activities that are effective, easily adopted, have widespread appeal, and are quantifiable.

2 Municipal Conservation Terminology and Review of Methodology Used by Regional Planners

To make use of the results of this study, it is important to understand several key terms used in the water planning process.

What is a water user group?

In this report, a water user group (WUG) refers to a retail water provider in the form a city, municipal utility district, water control and improvement district, special utility district, water supply corporation, fresh water supply district, or other type of water utility. The TWDB further defines WUGs as one of the following (Texas Water Development Board, 2016b):

- Cities and towns with a population of 500 or more
- Non-city utilities providing more than 280 acre-feet per year per year of water for municipal use
- Collective reporting units (CRUs) consisting of grouped utilities having a common association

[1] Equal to 811,224 acre-feet per year in conservation savings.

- County-Wide WUGs:
    - County-Other (Rural/unincorporated areas of municipal water use)
    - Manufacturing
    - Steam electric power generation

What is a recommended water management strategy?

A recommended water management strategy (WMS) is a measure that will help ensure WUGs have adequate water supplies for their end users well into the future. WMS examples include river diversions, groundwater use, reservoir and aquifer development, and irrigation conservation. When WMS is referred to in this report, it refers only to municipal conservation, which may include water loss reduction as a part of the same strategy.

What is a WMS supply volume?

A WMS supply volume is the amount of water that a given strategy is expected to yield each decade in the planning period if carried out by the WUG. In this report, a WMS supply volume is the amount of water recommended to come from municipal water conservation.

Some regional water plans separate this strategy's supply volume into a volume for municipal water conservation and a volume for water loss reduction for each decade. The total strategy supply volume is the sum of both. A regional water plan may also refer to "advanced conservation" as part of this strategy. Advanced conservation usually indicates that the volume could be achieved through a more robust mix of conservation activities described in the plan.

2.1 Regional Planning Group Approach to Determining Supply Volumes

Each regional water planning group (RWPG) is responsible for producing its own individual plan that, if executed, will provide sufficient water to its WUGs throughout a 50-year planning period. These plans are completed in five-year cycles, with the most recent edition being completed in 2016. The 2016 regional plans make up the 2017 State Water Plan, which sets out WMS supply volumes for the years 2020 through 2070.

The decadal WMS supply volumes for municipal conservation were established by each of the RWPGs in much the same manner. The RWPGs generally followed the guidelines of the Texas Legislature's Water Conservation Implementation Task Force on the pace utilities should target to reduce gallons per capita per day (GPCD)[2] consumption levels.

The targeted reductions used by most regions follow this formula:

- For municipal WUGs with water use of 140 GPCD and greater, the goal is to reduce per capita water use by one percent per year until the level of 140 GPCD is reached,

[2] Regional water planning GPCD is defined as the annual volume of water pumped, diverted, or purchased minus the volume exported (sold) to other water systems or large industrial facilities divided by the permanent resident population of the Municipal Water User Group in the regional water planning process divided by 365. Saline and reused/recycled water are not included in this volume (Texas Water Development Board, 2012).

after which, the goal is to reduce per capita water use by one-fourth percent per year for the remainder of the planning period (Texas Water Development Board, 2016j).

The yearly reductions in GPCD for a given WUG are then converted into recommended supply volumes in acre-feet per year for each decade as the reductions in consumption continue. Some regions reduce GPCD by slightly different percentages before and after the 140 GPCD threshold, some do not apply further reductions in GPCD for WUGs once they reach 140 GPCD, while others recommend only "advanced conservation" activities once WUGs meet 140 GPCD.

2.2 Methodology

In order to complete a uniform quantification process, the first engagement was with utilities that agreed to participate and collected as much relevant data as possible. These data included, among many others, historical GPCD consumption figures, advanced metering infrastructure (AMI) specifications, and detailed feedback on each conservation activity being implemented. Personal interviews focused on determining when and to what extent these activities were being employed, as well as assessing plans to continue such conservation. Examples of frequently implemented activities include tiered water rate conservation pricing, strategic water rate increases, outdoor irrigation audits and ordinances, and rain barrel distribution.

Subsequently, each utility's conservation activities were quantified through several different means, including evidence-based studies, utility field results and savings determinations, manufacturer guarantees, water loss audits, TWDB studies, and other information that assigned a savings value to the activity's implementation.

Every conservation activity studied and quantified has a gallons-per-year estimate, useful life, and decay rate (if applicable) associated with it. Some activities' savings are projected to grow as demand grows over time, while some savings are constant each year and subside once useful life has run its course. For expanded methodology and details on studies and formulas used to determine activity savings, refer to Section 6 of the State Report included as part of this document.

Once analyzed, the resulting savings estimates from each utility were compared with the recommended WMS supply volumes in its respective regional plan to determine if the savings met, exceeded, or fell short of those volumes. Individual utility savings were aggregated to compare with regional volumes, and regional savings were aggregated to compare with state volumes.

It is important to note that this report quantified activity savings—not including water loss reduction—for the WMS supply volume comparison dating back to 2012. The reason for this is, with a few exceptions, the regional planners used 2011 as the base year for establishing potential WMS supply volumes.[3] In addition, any conservation savings achieved through 2011 are assumed to be accounted for in the regional water planning GPCD for that year.[4] Thus, quantifying from 2012 and forward is the most accurate way to determine if utilities are meeting

[3] Confirmed via personal communication with Region C, H, K, and L Plan consultants.
[4] It was established with TWDB planning staff that 2011 GPCD levels were chosen because they represented the most current water use and conservation patterns at the time.

the recommended conservation volumes in the regional plans. This assumption is by no means 100 percent accurate, however. Some previously implemented activities' savings persist into future years beyond this starting point, while some activities' savings have ceased. One year's GPCD will not necessarily include all savings yielded by conservation activities that came before it, but the quantification assessment must have a starting point.

2.3 Quantifiable Savings

The key to the project being useful and reliable is that the results from year to year are measurable. Quantifying conservation activities that can be accurately measured provides greater certainty and better planning for all stakeholders.

While many utilities are engaged in a variety of conservation activities, not all can currently be properly measured. Some examples of these activities include education initiatives, website and social media engagement, and enforcement for water waste. That does not mean these measures are not essential. Education of consumers, for example, is a fundamental activity that makes all others effective, but little hard data exists to quantify the results of education alone.

In addition, the work of conservation coordinators can have a particularly significant effect on the savings of all other activities, but the specific savings attributed to that staff role is difficult to quantify.

3 Results

This report compares West Travis County Public Utility 's current water conservation activities and their quantified savings to two metrics: 1) Region K Water Plan's (Texas Water Development Board, 2016i) recommended WMS supply volumes for municipal conservation, and 2) West Travis County Public Utility 's own 5- and 10-year goals as established in its most recent water conservation plan submitted to the TWDB.

The WMS supply volumes for municipal water conservation are laid out by decade (2020 – 2070) in the regional water plans to serve as benchmarks for what each utility could achieve via that strategy during a 50-year planning period.[5]

The 5- and 10-year goals in West Travis County Public Utility 's most recent water conservation plan are established by the utility as realistic targets for reducing consumption over that timeframe. These reductions[6] are expressed in decreasing total GPCD [7] consumption and water loss GPCD.[8] [9]

---

[5] Some regional water plans separate this strategy volume into a volume for water conservation and a volume for water loss reduction for each decade. The total strategy volume is the sum of both.

[6] Occasionally, some utilities expect consumption to increase due to various reasons, such as an incoming industrial presence expected to raise consumption figures for the entire service area.

[7] As defined in TWDB water conservation plan annual report (Texas Water Development Board, 2016o): (Total Gallons in System ÷ Permanent Population) ÷ 365

[8] These plans also have targets for residential GPCD and water loss as a percentage (rather than GPCD), but this report does not address those goals.

[9] As defined in TWDB water conservation plan annual report (Texas Water Development Board, 2016o): (Total Water Loss ÷ Permanent Population) ÷ 365

The estimated savings in Tables 3-1 through 3-3 indicate the best information available as provided by utility staff. Some ongoing activities may not be known and are within a utility's service area are implemented on a micro-scale that may not be quantified. Individual households and businesses may be implementing conservation measures that are unknown and therefore cannot be included in the report.

Explanation of approach to assessing water loss reduction savings

Water loss reduction savings are defined as the volume of water participating utilities are realizing from their water loss mitigation efforts. For this report, this value is the difference between each individual utility's baseline[10] for water loss GPCD and its most recent water loss GPCD reported in 2015 water loss audits on file with TWDB. Savings from all water loss reduction efforts—including pipe replacements and leak repair—are assumed to be included in this comparison to a utility's baseline.

Note that because a single year (2015) value was used for comparison, it is possible that the 2015 value could be anomalous due to a number of events that may have occurred that year, such as a water main break, a particularly wet year, or a robust effort by the utility to curtail water loss. This will distort future savings figures that were carried forward in the study because water loss will inevitably increase or decrease in later years.

Ideally, using a rolling five-year average in the calculation would correct such anomalies. However, there was insufficient data to do that for every utility. The approach was to use the most complete water loss data possible, which was represented by the 2015 water loss audit. This problem will be further minimized, as continued data collection will allow five-year averages to be calculated for a majority of utilities.

In this way, water loss savings estimates are different from all other activity savings estimates in the project. Whether savings were positive or negative depended on where individual utilities established their own baselines or where their five-year average started, and what water loss GPCD value was reported in 2015.

3.1 Current Savings Compared to Conservation WMS Supply Volume (in million gallons) in Regional Water Plan

Table 3-1 shows the 2070 outlook for West Travis County Public Utility with the utility's yearly recommended WMS supply volume in million gallons (MG) alongside its water savings from implemented activities, including from water loss reduction. These activities and their associated savings are covered in greater detail in Sections 4 and 5.

Starting in 2015, this table compares all quantified conservation activity and the recommended conservation WMS supply volume for the planning period. The following definitions pair with the column headers in Table 3-1.

[10] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.

Actual Current Conservation Activity Savings – All quantified activities currently being performed by the utility, *excluding* savings from water loss reduction. The regional planners used 2011 GPCD as the baseline for determining future conservation WMS supply volumes, therefore the study quantifies utility savings starting in 2012 for this comparison. The summary of these savings can be referenced in Table 5-1.

Actual Water Loss Reduction Savings (as of 2015) – The difference between the baseline[11] for water loss GPCD and most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB. [12] The summary of these savings can be referenced in Table 5-2.

Total Savings from All Conservation Activity – Actual Current Conservation Activity Savings plus Actual Water Loss Reduction Savings (as of 2015).

Conservation WMS Volume – The recommended municipal water conservation supply volume in the regional plan for the decades ranging from 2020 to 2070. These volumes are converted to MG from the values listed in the plan in acre-feet and then calculated in annual increments.

Water Loss Reduction WMS Volume – Some regional water plans have a separate WMS volume for water conservation and for water loss reduction for each decade. If a WUG's regional plan has a WMS volume for water loss reduction, this column will have values other than zero.

Total Yearly WMS Volume – The sum of the Conservation WMS Volume and Water Loss Reduction WMS Volume.

Over (Short) – The amount that the utility's Total Savings from All Conservation Activity (since 2012), is over or below the Total Yearly WMS Volume in the regional water plan. If the amount falls below the WMS volume, it will appear in parentheses.

[11] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.
[12] If water loss GPCD has increased from the utility's baseline or historic five-year average to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount.

Table 3-1. Current Savings Compared to Conservation WMS Supply Volume (MG) in Regional Water Plan.

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)
2015	116.9	(98)	19	93	0	93	(74)
2016	93.7	(100)	(7)	116	0	116	(122)
2017	70.5	(103)	(32)	116	0	116	(148)
2018	47.3	(105)	(58)	139	0	139	(197)
2019	24.1	(107)	(83)	162	0	162	(245)
2020	0.9	(110)	(109)	208	0	208	(317)
2021	0.9	(113)	(112)	239	0	239	(351)
2022	0.9	(117)	(116)	269	0	269	(385)
2023	0.9	(120)	(119)	300	0	300	(419)
2024	0.9	(124)	(123)	330	0	330	(453)

3.2 Utility Water Conservation Plan Goals – Total GPCD

Table 3-2 shows how West Travis County Public Utility 's quantified savings from its implemented activities compare with 5- and 10-year goals established in its individual water conservation plan submitted to the TWDB. The following definitions pair with the column headers in Table 3-2.

Utility Population – Estimated utility service area population for the years indicated.

Total GPCD Goals – Total GPCD goals start with the utility's baseline[13] for total GPCD and progress in subsequent years to match 5- and 10-year goals indicated in a utility's five-year water conservation plan on file with the TWDB. The first five annual GPCD goals were developed by spreading the difference between the baseline and five-year goal evenly over five years. The second five annual GPCD goals spread the difference between the five-year goal and 10-year goal evenly over the next five years.

Annual Savings Goal with Reduction in GPCD (MG) – This column shows what reductions from the baseline GPCD would yield in terms of volume each year as more water is saved. The volumes indicated here are what target GPCD goals look like expressed in million gallons. Annual volumes were derived using the formula: (baseline total GPCD – target total GPCD for that year) x 365 days ÷ 1,000,000 gallons.

Total Savings for All Current Quantified Activities (MG) – Total quantified savings for all current conservation activities and savings from water loss reduction. Refer to Tables 5-1 and 5-2 for details on these savings.

Over (Short) – The amount that the utility's total quantified savings for all current conservation activities (since 2012), including water loss reduction, is over or below the volume represented by reductions in GPCD each year. If the quantified savings are less than these target volumes, the value will appear in parentheses.

Table 3-2. Utility Water Conservation Plan Goals — Total GPCD.

Year #	Year	Utility Population	Total GPCD Goals	Annual Savings Goal with Reduction in GPCD (MG)	Total Savings for All Current Quantified Activities (MG)	Over (Short) (MG)
0	**Baseline**	-	139	0	0	0
1	2015	13,414	167	(138)	19	157
2	2016	13,734	195	(283)	(7)	276
3	2017	14,054	224	(434)	(32)	402
4	2018	14,375	252	(592)	(58)	534
5-year Goal	2019	14,695	280	(756)	(83)	673
6	2020	15,015	267	(702)	(109)	593
7	2021	15,494	254	(650)	(112)	538
8	2022	15,972	241	(595)	(116)	479
9	2023	16,451	228	(534)	(119)	415
10-year Goal	2024	16,929	215	(470)	(123)	347

[13] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for total GPCD from the utility's most recently submitted five-year water conservation plan was used.

3.3 Utility Water Conservation Plan Goals – Water Loss GPCD

Table 3-3 shows how West Travis County Public Utility ’s most recent water loss audit compares with five- and 10-year water loss goals in its water conservation plan. The following definitions pair with the column headers in Table 3-2.

Utility Population – Estimated utility service area population for the years indicated.

Water Loss GPCD Goals – Water loss GPCD goals start with the utility’s baseline[14] for water loss GPCD and progress in subsequent years to match 5- and 10-year water loss goals indicated in a utility’s five-year water conservation plan on file with the TWDB. The first five annual GPCD goals were developed by spreading the difference between the baseline and five-year goal evenly over five years. The second five annual GPCD goals spread the difference between the five-year goal and 10-year goal evenly over the next five years.

Yearly Savings Goal with Reduction in GPCD (MG) – This column shows what reductions from the baseline water loss GPCD would yield in terms of volume each year as more water is saved. The volumes indicated here are what target water loss GPCD goals look like expressed in million gallons. Annual volumes were derived using the formula: (baseline water loss GPCD – target water loss GPCD for that year) x 365 days ÷ 1,000,000 gallons.

Total Savings from Water Loss Reduction (MG) – The difference between a utility’s established baseline for water loss GPCD and the most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB. If water loss GPCD has increased from the utility's baseline to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount. Reference Table 5-2 for savings from water loss reduction.

Over (Short) – The amount that the utility's total savings from water loss reduction is over or below the volume represented by reductions in GPCD each year. If water loss reduction savings are less than these target volumes, the value will appear in parentheses.

Table 3-3. Utility Water Conservation Plan Goals — Water Loss GPCD.

Year #	Year	Utility Population	Water Loss GPCD Goals	Yearly Savings Goal with Reduction in GPCD (MG)	Total Savings from Water Loss Reduction (MG)	Over (Short) (MG)
0	**Baseline**	-	40.00	0	0	0
1	2015	13,414	40.40	(2)	(98)	(96)
2	2016	13,734	40.80	(4)	(100)	(96)
3	2017	14,054	41.20	(6)	(103)	(96)
4	2018	14,375	41.60	(8)	(105)	(97)
5-year Goal	2019	14,695	42.00	(11)	(107)	(97)
6	2020	15,015	38.00	11	(110)	(121)
7	2021	15,494	34.00	34	(113)	(147)
8	2022	15,972	30.00	58	(117)	(175)
9	2023	16,451	26.00	84	(120)	(204)
10-year Goal	2024	16,929	22.00	111	(124)	(235)

[14] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.

4 Implemented Activities

Below is a list of completed activities with estimated water savings. Note that drought response and other measures are not included in the utility's water savings because they are temporary, awareness-based or not able to be accurately quantified on an annual basis.

These are not savings projections of potential future activities. Estimated savings are based on measures that have actually been implemented. If savings are shown to persist in future years, it is because the measure is permanent, such as an ordinance, or the savings are assumed to continue for the reason listed under the itemized activity. Estimated savings from water rate increases are the one exception to these conditions.

Water Rate Increases

Savings from water rate increases were included because entities such as the U.S. Environmental Protection Agency and others indicate specific savings for utilities that raise rates (Texas Water Development Board, 2013; U.S. E.P.A., 1998; Whitcomb, 1999). This project includes surveys of several utilities that have minimal education efforts, perform no other substantive conservation activities, and yet experienced significant demand reduction that coincided with rate increases. In those cases, savings estimates matched up closely with decreases in total GPCD. For many smaller utilities, especially those with customers lacking disposable income, this measure is the only tool used to conserve other than water loss reduction.

The following assumptions were made for water rate increases:

- The model assumes that savings persist into future years because it is expected that the utility will continue to make periodic rate increases in line with the percentage increases from previous years.
- Only the last two rate increases for a utility were quantified.
- Savings grow with demand because as new customers enter the service area, they are assumed to adhere to the same price elasticity model estimates.
- A weighted average for savings was used when rate increases differed between residential and industrial-commercial-institutional (ICI) customers based on the individual utility's customer class breakdown.
- When a utility raised rates using tiered rate conservation pricing, a 50/50 savings split was used when increases differed between base and volumetric rates.
    - The reasoning is that all customers must react to the base increase, yet the pricing signal is stronger when volumetric rate increases affect the higher usage customers.
    - The 50/50 split is reasonable because many customers will not reach the higher volumetric tiers.
    - Studies show that most customers do not actually know they have reached the higher volumetric tiers; just that their bill has increased (Texas Water Development Board, 2013).

4.1 Itemized Activities

1. **Utility Website**
    a. Easy-to-use website with conservation tips and water rates
    b. Features contact information for Public Works staff and customer service

2. **Continuing Public Education**
    a. The utility engages the public in many ways including:
        i. Brochures, bill messages, displays, and exhibits

3. **Water Loss Reduction Savings**[15]
    a. Loss of 98 MG annually in 2015
    b. Water loss reduction savings = the difference between a utility's baseline[16] water loss GPCD submitted in its most recent 5-year water conservation plan and its most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB
    c. If water loss GPCD has increased from the utility's baseline or historic 5-year average to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount.
    d. All savings estimates grow each year at the same rate population figures for the utility grow in the regional water plan.

4. **Automatic Meter Reading (AMR)/Advanced Metering Infrastructure (AMI)**
    a. These metering systems can save water in a number of ways, including from water loss reduction through improved leak detection.
    b. All water loss reduction savings associated with this activity are detailed in Section 5, which assessed utility baseline water loss GPCD and most recently reported water loss GPCD to determine water savings.
    c. For estimated water savings that could be increased by implementing meter data management (MDM) and customer engagement portal applications, refer to Section 6 of this report.
        i. With these additional applications, water savings can be achieved through changed customer behavior and other real-time actions that go beyond water loss reduction.

5. **Twice-a-week Outdoor Watering Restriction Ordinance**
    a. Estimated savings of 6.53% of total utility demand (Hermitte and Mace, 2012; Sierra Club-Lone Star Chapter and the National Wildlife Federation, 2015)
    b. All savings estimates grow each year at the same rate demand figures for the utility grow in the regional water plan.

---

[15] If current water loss levels exceed a utility's baseline, this value is treated as a deduction from total quantified savings.
[16] In the absence of having a baseline figure provided in the utility's most recently submitted 5-year water conservation plan, the historic 5-year average for water loss GPCD in the plan was used.

c. The 2x permanent watering ordinance was repealed and discontinued after 2015.
    i. Assumed that savings for this activity will phase out over five years, nearing zero in 2020.

6. High Efficiency (HE) Toilet Rebate

a. Estimated 10,390 gallons per year per toilet (A&N Technical Services, 2005)
b. Savings carry on indefinitely because replacement toilet will be as efficient

7. HE Toilet Rebate for Industrial-Commercial-Institutional (ICI) Customers

a. Estimated 13,000 gallons per year per toilet (A&N Technical Services, 2005)
b. 20-year useful life for fixture[17]

8. Showerhead Distribution for Single Family (SF) Customers

a. Estimated 2,050 gallons per year per showerhead (A&N Technical Services, 2005)
b. 5-year useful life
    i. If distributed after 2009, plumbing code will require that replacement is equally as efficient, so savings will carry forward indefinitely

[17] Plumbing code and efficiency standards effectively make the savings permanent, as new high-efficiency models will replace these toilets.

5 Summary of Savings

Table 5-1. Savings by Water Conservation Activity (MG).

Year	2x Watering Ordinance	Tank-type HE Toilets (ICI)	Low Flow Showerheads (SF)	HE Toilets (SF)	TOTAL SAVINGS
2009	90				90.2
2010	95				94.5
2011	99	0.25			99.1
2012	103	0.25	0.26	0.35	104.0

Table 5-2. Savings from Water Loss Reduction (MG).

Year	Utility Population	Water Loss GPCD	Total Savings from Water Loss Reduction
Baseline	-	40.00	0
2015	13,414	60.00	(98)
2016	13,734	60.00	(100)
2017	14,054	60.00	(103)
2018	14,375	60.00	(105)
2019	14,695	60.00	(107)
2020	15,015	60.00	(110)
2021	15,494	60.00	(113)
2022	15,972	60.00	(117)
2023	16,451	60.00	(120)
2024	16,929	60.00	(124)

6 Suggested Activities

Up to four activities were chosen as potential suggested activities for individual reports. These activities are: AMI system with customer portal, twice-per-week (or less) outdoor watering ordinances, strategic water rate increases, and rain barrels.

Activities were chosen because they are:

- Achievable
- Prevalence of vendors that can actually implement them
- Acceptability to city councils, MUD boards, et al.
- Easily adopted
- Cost effective
- Yield high savings relative to cost

AMI systems with customer engagement portals were also chosen because they represent a profusion of future applications that will undoubtedly continue to advance conservation efforts. AMI and meter data management (MDM) companies are developing new and innovative ways to benefit water providers, customers, and ultimately states that are pushing conservation and usage analytics further.

Each utility should be cognizant of the potential impact that these suggested activities may have on its own unique rate and revenue situation.

Benefits to consider:

- Avoided water supply and wastewater costs
  - The higher water purchase, transmission, and distribution costs are, the greater the potential benefit realized when large amounts of water are conserved with these activities.
- Avoided system expansion costs
  - Conserving water may allow a utility to postpone building new system capacity by decreasing demand even as population grows.

Costs to consider:

- Staff time and resources
- Unit cost per unit saved
- Implementation costs
- Stakeholder agreement and support
- Other overhead and budget considerations

6.1 Suggested Activities with Savings Estimates

1. Advanced Metering Infrastructure with Customer Engagement Portal

These portals, along with mobile applications and billing statements, can provide customers with much more access to their water use data in simple and compelling formats. This access and comparison with other customers' usage can reduce water use through changed behavior, as well as provide an opportunity for other conservation programs to be offered to the customer for increased adoption and additional savings. AMI systems support leak notification and web portals with real-time data. Any water loss reduction savings that these systems also yield were included in the water loss assessment of individual reports for this project.

a. Specific utility results will vary based on portal features and frequency of customer notifications

b. Potential savings estimate assumes 20% of residential customers will use and save water due to the portal (Westin Engineering, 2015)

c. Estimate assumes customers will save 10% of total annual use due to the portal

  i. Savings estimate of 10% is an average of results from multiple studies (Chesnutt and Mitchell, 2013; East Bay Municipal Utility District, 2014; IBM, 2011; Texas A&M and Texas Water Resources Institute, 2016; Westin Engineering, 2015)

d. Residential customers' use assumed to make up approximately 67% of all retail customers' use based on utility profile information submitted to the TWDB

  i. This was the most common percentage of residential use among participating utilities in this project.

  ii. Actual customer class demand percentages will vary by utility.

e. 20% of residential customers saving 10% with this customer class breakdown amounts to 1.34% of total demand

f. Savings are assumed to increase along with demand as connections increase each year[18]

g. See Table 6-1 for potential savings from this measure compared with the utility’s WMS supply volumes targets.

[18] The 10% consumption reduction figure for 20% of residential customers is conservative, but savings could be greater when monitored yearly as customer engagement increases.

Table 6-1. Current Savings + Potential Savings from AMI with Customer Portal (MG).

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Potential Savings from AMI with Customer Portal	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)

2039	1	(181)	(180)	46	894	0	894	(1,028)
2040	1	(185)	(185)	47	936	0	936	(1,073)

2. Water Rate Increase
    a. For every 10% increase, estimated savings could be 2% of utility total demand.
    b. Approximately 37 MG of savings per year with current demand
    c. Savings is cumulative and based on more than one source[19] (U.S. EPA, 1998; Whitcomb, 1999)
    d. See Table 6-2 for potential savings from this measure compared with the utility's conservation goals.

[19] The study estimates a 2% demand reduction with 10% increase in price on a targeted customer class. By applying a ratio, it is possible to determine the savings for lower or higher percentage increases.

Table 6-2. Current Savings + Potential Savings from 10% Water Rate Increase (MG).

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Potential Savings from Water Rate Increase	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)

2040	1	(185)	(185)	71	936	0	936	(1,050)

3. Rain Barrels
   a. In Region K, utilities could save approximately 22.4 gallons per year per gallon of capacity rebated, sold, or distributed (GDS Associates, 2002).
   b. Estimated 10-year useful life for most barrels

Region L Individual Reports

Statewide Water Conservation Quantification Project
City of Alamo Heights Report • 2017

1 Introduction

In Texas' 2017 State Water Plan, municipal water conservation is projected to meet 9.6 percent[1] of the state's future water needs by 2070. According to the 16 regional water plans that comprise the state water plan, this is expected to be achieved through a variety of measures such as installation of water efficient plumbing fixtures, water conservation pricing structures, water system audits, landscape irrigation ordinances, as well as other water conservation activities. The 9.6 percent is "in addition to the estimated share of future passive conservation savings from plumbing codes and water efficiency standards, which are embedded in municipal water demand projections" (Texas Water Development Board, 2017).

In 2015, the Texas Legislature appropriated funds to the Texas Water Development Board (TWDB) to fund a research project principally charged with quantitatively determining the savings of municipal water conservation activities being implemented in relation to the recommended conservation goals (supply volumes) in the State Water Plan. As part of the project, individual reports were completed for all participating utilities.

With this report, utilities will benefit by receiving a clear and concise picture of its water conservation goals alongside estimated savings from quantifiable activities. In the event that current activity savings may not be able to reach long-term goals, this report offers suggestions on how utilities can reach water conservation goals with activities that are effective, easily adopted, have widespread appeal, and are quantifiable.

2 Municipal Conservation Terminology and Review of Methodology Used by Regional Planners

To make use of the results of this study, it is important to understand several key terms used in the water planning process.

What is a water user group?

In this report, a water user group (WUG) refers to a retail water provider in the form a city, municipal utility district, water control and improvement district, special utility district, water supply corporation, fresh water supply district, or other type of water utility. The TWDB further defines WUGs as one of the following (Texas Water Development Board, 2016b):

- Cities and towns with a population of 500 or more
- Non-city utilities providing more than 280 acre-feet per year per year of water for municipal use
- Collective reporting units (CRUs) consisting of grouped utilities having a common association

[1] Equal to 811,224 acre-feet per year in conservation savings.

- County-Wide WUGs:
  - County-Other (Rural/unincorporated areas of municipal water use)
  - Manufacturing
  - Steam electric power generation

What is a recommended water management strategy?

A recommended water management strategy (WMS) is a measure that will help ensure WUGs have adequate water supplies for their end users well into the future. WMS examples include river diversions, groundwater use, reservoir and aquifer development, and irrigation conservation. When WMS is referred to in this report, it refers only to municipal conservation, which may include water loss reduction as a part of the same strategy.

What is a WMS supply volume?

A WMS supply volume is the amount of water that a given strategy is expected to yield each decade in the planning period if carried out by the WUG. In this report, a WMS supply volume is the amount of water recommended to come from municipal water conservation.

Some regional water plans separate this strategy's supply volume into a volume for municipal water conservation and a volume for water loss reduction for each decade. The total strategy supply volume is the sum of both. A regional water plan may also refer to "advanced conservation" as part of this strategy. Advanced conservation usually indicates that the volume could be achieved through a more robust mix of conservation activities described in the plan.

2.1 Regional Planning Group Approach to Determining Supply Volumes

Each regional water planning group (RWPG) is responsible for producing its own individual plan that, if executed, will provide sufficient water to its WUGs throughout a 50-year planning period. These plans are completed in five-year cycles, with the most recent edition being completed in 2016. The 2016 regional plans make up the 2017 State Water Plan, which sets out WMS supply volumes for the years 2020 through 2070.

The decadal WMS supply volumes for municipal conservation were established by each of the RWPGs in much the same manner. The RWPGs generally followed the guidelines of the Texas Legislature's Water Conservation Implementation Task Force on the pace utilities should target to reduce gallons per capita per day (GPCD)[2] consumption levels.

The targeted reductions used by most regions follow this formula:

- For municipal WUGs with water use of 140 GPCD and greater, the goal is to reduce per capita water use by one percent per year until the level of 140 GPCD is reached,

[2] Regional water planning GPCD is defined as the annual volume of water pumped, diverted, or purchased minus the volume exported (sold) to other water systems or large industrial facilities divided by the permanent resident population of the Municipal Water User Group in the regional water planning process divided by 365. Saline and reused/recycled water are not included in this volume (Texas Water Development Board, 2012).

> after which, the goal is to reduce per capita water use by one-fourth percent per year for the remainder of the planning period (Texas Water Development Board, 2016j).

The yearly reductions in GPCD for a given WUG are then converted into recommended supply volumes in acre-feet per year for each decade as the reductions in consumption continue. Some regions reduce GPCD by slightly different percentages before and after the 140 GPCD threshold, some do not apply further reductions in GPCD for WUGs once they reach 140 GPCD, while others recommend only "advanced conservation" activities once WUGs meet 140 GPCD.

2.2 Methodology

In order to complete a uniform quantification process, the first engagement was with utilities that agreed to participate and collected as much relevant data as possible. These data included, among many others, historical GPCD consumption figures, advanced metering infrastructure (AMI) specifications, and detailed feedback on each conservation activity being implemented. Personal interviews focused on determining when and to what extent these activities were being employed, as well as assessing plans to continue such conservation. Examples of frequently implemented activities include tiered water rate conservation pricing, strategic water rate increases, outdoor irrigation audits and ordinances, and rain barrel distribution.

Subsequently, each utility's conservation activities were quantified through several different means, including evidence-based studies, utility field results and savings determinations, manufacturer guarantees, water loss audits, TWDB studies, and other information that assigned a savings value to the activity's implementation.

Every conservation activity studied and quantified has a gallons-per-year estimate, useful life, and decay rate (if applicable) associated with it. Some activities' savings are projected to grow as demand grows over time, while some savings are constant each year and subside once useful life has run its course. For expanded methodology and details on studies and formulas used to determine activity savings, refer to Section 6 of the State Report included as part of this document.

Once analyzed, the resulting savings estimates from each utility were compared with the recommended WMS supply volumes in its respective regional plan to determine if the savings met, exceeded, or fell short of those volumes. Individual utility savings were aggregated to compare with regional volumes, and regional savings were aggregated to compare with state volumes.

It is important to note that this report quantified activity savings—not including water loss reduction—for the WMS supply volume comparison dating back to 2012. The reason for this is, with a few exceptions, the regional planners used 2011 as the base year for establishing potential WMS supply volumes.[3] In addition, any conservation savings achieved through 2011 are assumed to be accounted for in the regional water planning GPCD for that year.[4] Thus, quantifying from 2012 and forward is the most accurate way to determine if utilities are meeting

[3] Confirmed via personal communication with Region C, H, K, and L Plan consultants.
[4] It was established with TWDB planning staff that 2011 GPCD levels were chosen because they represented the most current water use and conservation patterns at the time.

the recommended conservation volumes in the regional plans. This assumption is by no means 100 percent accurate, however. Some previously implemented activities' savings persist into future years beyond this starting point, while some activities' savings have ceased. One year's GPCD will not necessarily include all savings yielded by conservation activities that came before it, but the quantification assessment must have a starting point.

2.3 Quantifiable Savings

The key to the project being useful and reliable is that the results from year to year are measurable. Quantifying conservation activities that can be accurately measured provides greater certainty and better planning for all stakeholders.

While many utilities are engaged in a variety of conservation activities, not all can currently be properly measured. Some examples of these activities include education initiatives, website and social media engagement, and enforcement for water waste. That does not mean these measures are not essential. Education of consumers, for example, is a fundamental activity that makes all others effective, but little hard data exists to quantify the results of education alone.

In addition, the work of conservation coordinators can have a particularly significant effect on the savings of all other activities, but the specific savings attributed to that staff role is difficult to quantify.

3 Results

This report compares Alamo Heights' current water conservation activities and their quantified savings to two metrics: 1) Region L Water Plan's (Texas Water Development Board, 2016j) recommended WMS supply volumes for municipal conservation, and 2) Alamo Heights' own 5- and 10-year goals as established in its most recent water conservation plan submitted to the TWDB.

The WMS supply volumes for municipal water conservation are laid out by decade (2020 – 2070) in the regional water plans to serve as benchmarks for what each utility could achieve via that strategy during a 50-year planning period.[5]

The 5- and 10-year goals in Alamo Heights' most recent water conservation plan are established by the utility as realistic targets for reducing consumption over that timeframe. These reductions[6] are expressed in decreasing total GPCD [7] consumption and water loss GPCD.[8] [9]

---

[5] Some regional water plans separate this strategy volume into a volume for water conservation and a volume for water loss reduction for each decade. The total strategy volume is the sum of both.

[6] Occasionally, some utilities expect consumption to increase due to various reasons, such as an incoming industrial presence expected to raise consumption figures for the entire service area.

[7] As defined in TWDB water conservation plan annual report (Texas Water Development Board, 2016o): (Total Gallons in System ÷ Permanent Population) ÷ 365

[8] These plans also have targets for residential GPCD and water loss as a percentage (rather than GPCD), but this report does not address those goals.

[9] As defined in TWDB water conservation plan annual report (Texas Water Development Board, 2016o): (Total Water Loss ÷ Permanent Population) ÷ 365

The estimated savings in Tables 3-1 through 3-3 indicate the best information available as provided by utility staff. Some ongoing activities may not be known and are within a utility's service area are implemented on a micro-scale that may not be quantified. Individual households and businesses may be implementing conservation measures that are unknown and therefore cannot be included in the report.

Explanation of approach to assessing water loss reduction savings

Water loss reduction savings are defined as the volume of water participating utilities are realizing from their water loss mitigation efforts. For this report, this value is the difference between each individual utility's baseline[10] for water loss GPCD and its most recent water loss GPCD reported in 2015 water loss audits on file with TWDB. Savings from all water loss reduction efforts—including pipe replacements and leak repair—are assumed to be included in this comparison to a utility's baseline.

Note that because a single year (2015) value was used for comparison, it is possible that the 2015 value could be anomalous due to a number of events that may have occurred that year, such as a water main break, a particularly wet year, or a robust effort by the utility to curtail water loss. This will distort future savings figures that were carried forward in the study because water loss will inevitably increase or decrease in later years.

Ideally, using a rolling five-year average in the calculation would correct such anomalies. However, there was insufficient data to do that for every utility. The approach was to use the most complete water loss data possible, which was represented by the 2015 water loss audit. This problem will be further minimized, as continued data collection will allow five-year averages to be calculated for a majority of utilities.

In this way, water loss savings estimates are different from all other activity savings estimates in the project. Whether savings were positive or negative depended on where individual utilities established their own baselines or where their five-year average started, and what water loss GPCD value was reported in 2015.

3.1 Current Savings Compared to Conservation WMS Supply Volume (in million gallons) in Regional Water Plan

Table 3-1 shows the 2070 outlook for Alamo Heights with the utility's yearly recommended WMS supply volume in million gallons (MG) alongside its water savings from implemented activities, including from water loss reduction. These activities and their associated savings are covered in greater detail in Sections 4 and 5.

Starting in 2015, this table compares all quantified conservation activity and the recommended conservation WMS supply volume for the planning period. The following definitions pair with the column headers in Table 3-1.

<u>Actual Current Conservation Activity Savings</u> – All quantified activities currently being

[10] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.

performed by the utility, *excluding* savings from water loss reduction. The regional planners used 2011 GPCD as the baseline for determining future conservation WMS supply volumes, therefore the study quantifies utility savings starting in 2012 for this comparison.

Actual Water Loss Reduction Savings (as of 2015) – The difference between the baseline[11] for water loss GPCD and most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB. [12] The summary of these savings can be referenced in Table 5-1.

Total Savings from All Conservation Activity – Actual Current Conservation Activity Savings plus Actual Water Loss Reduction Savings (as of 2015).

Conservation WMS Volume – The recommended municipal water conservation supply volume in the regional plan for the decades ranging from 2020 to 2070. These volumes are converted to MG from the values listed in the plan in acre-feet and then calculated in annual increments.

Water Loss Reduction WMS Volume – Some regional water plans have a separate WMS volume for water conservation and for water loss reduction for each decade. If a WUG's regional plan has a WMS volume for water loss reduction, this column will have values other than zero.

Total Yearly WMS Volume – The sum of the Conservation WMS Volume and Water Loss Reduction WMS Volume.

Over (Short) – The amount that the utility's Total Savings from All Conservation Activity (since 2012), is over or below the Total Yearly WMS Volume in the regional water plan. If the amount falls below the WMS volume, it will appear in parentheses.

[11] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.
[12] If water loss GPCD has increased from the utility's baseline or historic five-year average to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount.

Table 3-1. Current Savings Compared to Conservation WMS Supply Volume (MG) in Regional Water Plan.

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)

3.2 Utility Water Conservation Plan Goals – Total GPCD

Table 3-2 shows how Alamo Heights' quantified savings from its implemented activities compare with 5- and 10-year goals established in its individual water conservation plan submitted to the TWDB. The following definitions pair with the column headers in Table 3-2.

Utility Population – Estimated utility service area population for the years indicated.

Total GPCD Goals – Total GPCD goals start with the utility's baseline[13] for total GPCD and progress in subsequent years to match 5- and 10-year goals indicated in a utility's five-year water conservation plan on file with the TWDB. The first five annual GPCD goals were developed by spreading the difference between the baseline and five-year goal evenly over five years. The second five annual GPCD goals spread the difference between the five-year goal and 10-year goal evenly over the next five years

Annual Savings Goal with Reduction in GPCD (MG) – This column shows what reductions from the baseline GPCD would yield in terms of volume each year as more water is saved. The volumes indicated here are what target GPCD goals look like expressed in million gallons. Annual volumes were derived using the formula: (baseline total GPCD – target total GPCD for that year) x 365 days ÷ 1,000,000 gallons.

Total Savings for All Current Quantified Activities (MG) – Total quantified savings for all current conservation activities and savings from water loss reduction.

Over (Short) – The amount that the utility's total quantified savings for all current conservation activities (since 2012), including water loss reduction, is over or below the volume represented by reductions in GPCD each year. If the quantified savings are less than these target volumes, the value will appear in parentheses.

Table 3-2. Utility Water Conservation Plan Goals — Total GPCD.

Year #	Year	Utility Population	Total GPCD Goals	Annual Savings Goal with Reduction in GPCD (MG)	Total Savings for All Current Quantified Activities (MG)	Over (Short) (MG)
0	**Baseline**	-	252	0	0	0
1	2009	7,046	247	13	0	(13)
2	2010	7,065	242	26	0	(26)
3	2011	7,084	237	39	0	(39)
4	2012	7,103	232	52	0	(52)
5-year Goal	2013	7,122	227	65	0	(65)
6	2014	7,141	225	71	0	(71)
7	2015	7,160	223	77	0	(77)
8	2016	7,347	220	85	0	(85)
9	2017	7,534	218	93	0	(93)
10-year Goal	2018	7,721	216	101	0	(101)

[13] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for total GPCD from the utility's most recently submitted five-year water conservation plan was used.

3.3 Utility Water Conservation Plan Goals – Water Loss GPCD

Table 3-3 shows how Alamo Heights' most recent water loss audit compares with five- and 10-year water loss goals in its water conservation plan. The following definitions pair with the column headers in Table 3-2.

Utility Population – Estimated utility service area population for the years indicated.

Water Loss GPCD Goals – Water loss GPCD goals start with the utility's baseline[14] for water loss GPCD and progress in subsequent years to match 5- and 10-year water loss goals indicated in a utility's five-year water conservation plan on file with the TWDB. The first five annual GPCD goals were developed by spreading the difference between the baseline and five-year goal evenly over five years. The second five annual GPCD goals spread the difference between the five-year goal and 10-year goal evenly over the next five years.

Yearly Savings Goal with Reduction in GPCD (MG) – This column shows what reductions from the baseline water loss GPCD would yield in terms of volume each year as more water is saved. The volumes indicated here are what target water loss GPCD goals look like expressed in million gallons. Annual volumes were derived using the formula: (baseline water loss GPCD – target water loss GPCD for that year) x 365 days ÷ 1,000,000 gallons.

Total Savings from Water Loss Reduction (MG) – The difference between a utility's established baseline for water loss GPCD and the most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB. If water loss GPCD has increased from the utility's baseline to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount. Reference Table 5-1 for savings from water loss reduction.

Over (Short) – The amount that the utility's total savings from water loss reduction is over or below the volume represented by reductions in GPCD each year. If water loss reduction savings are less than these target volumes, the value will appear in parentheses.

Table 3-3. Utility Water Conservation Plan Goals — Water Loss GPCD.

Year #	Year	Utility Population	Water Loss GPCD Goals	Yearly Savings Goal with Reduction in GPCD (MG)	Total Savings from Water Loss Reduction (MG)	Over (Short) (MG)
0	**Baseline**	-	25.00	0	0	0
1	2009	7,046	25	1	0	(1)
2	2010	7,065	24	3	0	(3)
3	2011	7,084	24	4	0	(4)
4	2012	7,103	23	5	0	(5)
5-year Goal	2013	7,122	23	6	0	(6)
6	2014	7,141	22	7	0	(7)
7	2015	7,160	22	8	0	(8)
8	2016	7,347	22	9	0	(9)
9	2017	7,534	22	10	0	(10)
10-year Goal	2018	7,721	21	11	0	(11)

[14] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.

4 Implemented Activities

Below is a list of completed activities with estimated water savings. Note that drought response and other measures are not included in the utility's water savings because they are temporary, awareness-based or not able to be accurately quantified on an annual basis.

These are not savings projections of potential future activities. Estimated savings are based on measures that have actually been implemented. If savings are shown to persist in future years, it is because the measure is permanent, such as an ordinance, or the savings are assumed to continue for the reason listed under the itemized activity. Estimated savings from water rate increases are the one exception to these conditions.

Water Rate Increases

Savings from water rate increases were included because entities such as the U.S. Environmental Protection Agency and others indicate specific savings for utilities that raise rates (Texas Water Development Board, 2013; U.S. E.P.A., 1998; Whitcomb, 1999). This project includes surveys of several utilities that have minimal education efforts, perform no other substantive conservation activities, and yet experienced significant demand reduction that coincided with rate increases. In those cases, savings estimates matched up closely with decreases in total GPCD. For many smaller utilities, especially those with customers lacking disposable income, this measure is the only tool used to conserve other than water loss reduction.

The following assumptions were made for water rate increases:

- The model assumes that savings persist into future years because it is expected that the utility will continue to make periodic rate increases in line with the percentage increases from previous years.
- Only the last two rate increases for a utility were quantified.
- Savings grow with demand because as new customers enter the service area, they are assumed to adhere to the same price elasticity model estimates.
- A weighted average for savings was used when rate increases differed between residential and industrial-commercial-institutional (ICI) customers based on the individual utility's customer class breakdown.
- When a utility raised rates using tiered rate conservation pricing, a 50/50 savings split was used when increases differed between base and volumetric rates.
    - The reasoning is that all customers must react to the base increase, yet the pricing signal is stronger when volumetric rate increases affect the higher usage customers.
    - The 50/50 split is reasonable because many customers will not reach the higher volumetric tiers.
    - Studies show that most customers do not actually know they have reached the higher volumetric tiers; just that their bill has increased (Texas Water Development Board, 2013).

4.1 Itemized Activities

1. **Utility Website**
    a. Easy-to-use website with conservation tips and water rates
    b. Features contact information for Public Works staff and customer service

2. **Continuing Public Education**
    a. The utility engages the public in many ways including:
        i. Brochures, bill messages, displays, and exhibits

3. **Water Loss Reduction Savings**[15]
    a. Savings of 0 MG annually in 2015
    b. Water loss reduction savings = the difference between a utility's baseline[16] water loss GPCD submitted in its most recent 5-year water conservation plan and its most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB
    c. If water loss GPCD has increased from the utility's baseline or historic 5-year average to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount.
    d. All savings estimates grow each year at the same rate population figures for the utility grow in the regional water plan.

[15] If current water loss levels exceed a utility's baseline, this value is treated as a deduction from total quantified savings.
[16] In the absence of having a baseline figure provided in the utility's most recently submitted 5-year water conservation plan, the historic 5-year average for water loss GPCD in the plan was used.

5 Summary of Savings

Table 5-1. Savings from Water Loss Reduction (MG).

Year	Utility Population	Water Loss GPCD	Total Savings from Water Loss Reduction
Baseline	-	25.00	0
2015	7,160	25.00	0
2016	7,347	25.00	0
2017	7,534	25.00	0
2018	7,721	25.00	0
2019	7,908	25.00	0
2020	8,095	25.00	0
2021	8,128	25.00	0
2022	8,161	25.00	0
2023	8,193	25.00	0
2024	8,226	25.00	0

6 Suggested Activities

Up to four activities were chosen as potential suggested activities for individual reports. These activities are: AMI system with customer portal, twice-per-week (or less) outdoor watering ordinances, strategic water rate increases, and rain barrels.

Activities were chosen because they are:

- Achievable
- Prevalence of vendors that can actually implement them
- Acceptability to city councils, MUD boards, et al.
- Easily adopted
- Cost effective
- Yield high savings relative to cost

AMI systems with customer engagement portals were also chosen because they represent a profusion of future applications that will undoubtedly continue to advance conservation efforts. AMI and meter data management (MDM) companies are developing new and innovative ways to benefit water providers, customers, and ultimately states that are pushing conservation and usage analytics further.

Each utility should be cognizant of the potential impact that these suggested activities may have on its own unique rate and revenue situation.

Benefits to consider:

- Avoided water supply and wastewater costs

    - The higher water purchase, transmission, and distribution costs are, the greater the potential benefit realized when large amounts of water are conserved with these activities.
- Avoided system expansion costs
    - Conserving water may allow a utility to postpone building new system capacity by decreasing demand even as population grows.

Costs to consider:

- Staff time and resources
- Unit cost per unit saved
- Implementation costs
- Stakeholder agreement and support
- Other overhead and budget considerations

6.1 Suggested Activities with Savings Estimates

1. Twice-a-week Outdoor Watering Restriction Ordinance
  - **a.** Potentially 6.11% savings of total demand (Hermitte and Mace, 2012; Sierra Club-Lone Star Chapter and National Wildlife Federation, 2015)
    - i. Average Region L savings
    - ii. Specific percentage of outdoor usage unknown for your utility at this time
  - **b.** Savings could be 44 MG per year with current demand.
  - **c.** See Table 6-1 for potential savings from this measure compared with the city's WMS supply volumes targets.

Table 6-1. Current Savings + Potential Savings from 2x per Week Watering Ordinance (MG).

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Potential Savings from Ordinance	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)
2016	0	0	0	44	19	0	19	25
2017	0	0	0	44	19	0	19	25
2018	0	0	0	44	23	0	23	21
2019	0	0	0	44	26	0	26	18
2020	0	0	0	44	34	0	34	10
2021	0	0	0	44	40	0	40	5
2022	0	0	0	44	45	0	45	(1)
2023	0	0	0	44	51	0	51	(7)
2024	0	0	0	45	57	0	57	(12)
2025	0	0	0	45	63	0	63	(18)
2026	0	0	0	45	68	0	68	(24)
2027	0	0	0	45	74	0	74	(29)
2028	0	0	0	45	80	0	80	(35)
2029	0	0	0	45	86	0	86	(40)
2030	0	0	0	45	91	0	91	(46)
2031	0	0	0	45	97	0	97	(51)
2032	0	0	0	45	102	0	102	(57)
2033	0	0	0	45	107	0	107	(62)
2034	0	0	0	45	112	0	112	(67)
2035	0	0	0	45	118	0	118	(73)
2036	0	0	0	45	123	0	123	(78)
2037	0	0	0	45	128	0	128	(83)
2038	0	0	0	45	133	0	133	(89)
2039	0	0	0	45	139	0	139	(94)
2040	0	0	0	45	144	0	144	(99)

2. Advanced Metering Infrastructure with Customer Engagement Portal

These portals, along with mobile applications and billing statements, can provide customers with much more access to their water use data in simple and compelling formats. This access and comparison with other customers' usage can reduce water use through changed behavior, as well as provide an opportunity for other conservation programs to be offered to the customer for increased adoption and additional savings. AMI systems support leak notification and web portals with real-time data. Any water loss reduction savings that these systems also yield were included in the water loss assessment of individual reports for this project.

- **a.** Specific utility results will vary based on portal features and frequency of customer notifications
- **b.** Potential savings estimate assumes 20% of residential customers will use and save water due to the portal (Westin Engineering, 2015)
- **c.** Estimate assumes customers will save 10% of total annual use due to the portal
    - i. Savings estimate of 10% is an average of results from multiple studies (Chesnutt and Mitchell, 2013; East Bay Municipal Utility District, 2014; IBM, 2011; Texas A&M and Texas Water Resources Institute, 2016; Westin Engineering, 2015)
- **d.** Residential customers' use assumed to make up approximately 67% of all retail customers' use based on utility profile information submitted to the TWDB

i. This was the most common percentage of residential use among participating utilities in this project.
ii. Actual customer class demand percentages will vary by utility.

e. 20% of residential customers saving 10% with this customer class breakdown amounts to 1.34% of total demand

f. Savings are assumed to increase along with demand as connections increase each year[17]

g. See Table 6-2 for potential savings from this measure compared with the utility's WMS supply volumes targets.

Table 6-2. Current Savings + Potential Savings from AMI with Customer Portal (MG).

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Potential Savings from AMI with Customer Portal	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)

2031	0	0	0	10	97	0	97	(87)
2032	0	0	0	10	102	0	102	(92)
2033	0	0	0	10	107	0	107	(97)
2034	0	0	0	10	112	0	112	(103)
2035	0	0	0	10	118	0	118	(108)
2036	0	0	0	10	123	0	123	(113)
2037	0	0	0	10	128	0	128	(118)
2038	0	0	0	10	133	0	133	(124)
2039	0	0	0	10	139	0	139	(129)
2040	0	0	0	10	144	0	144	(134)

3. Water Rate Increase

a. For every 10% increase, estimated savings could be 2% of utility total demand.

b. Approximately 14 MG of savings per year with current demand

c. Savings is cumulative and based on more than one source[18] (U.S. EPA, 1998; Whitcomb, 1999)

d. See Table 6-3 for potential savings from this measure compared with the utility's conservation goals.

---

[17] The 10% consumption reduction figure for 20% of residential customers is conservative, but savings could be greater when monitored yearly as customer engagement increases.

[18] The study estimates a 2% demand reduction with 10% increase in price on a targeted customer class. By applying a ratio, it is possible to determine the savings for lower or higher percentage increases

Table 6-3. Current Savings + Potential Savings from 10% Water Rate Increase (MG).

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Potential Savings from Water Rate Increase	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)

2036	0	0	0	15	123	0	123	(108)
2037	0	0	0	15	128	0	128	(114)
2038	0	0	0	15	133	0	133	(119)
2039	0	0	0	15	139	0	139	(124)
2040	0	0	0	15	144	0	144	(129)

4. Rain Barrels
    a. In Region L, utilities could save approximately 17 gallons per year per gallon of capacity rebated, sold, or distributed (GDS Associates, 2002).
    b. Estimated 10-year useful life for most barrels

Statewide Water Conservation Quantification Project
Atascosa Rural WCS Report • 2017

1 Introduction

In Texas' 2017 State Water Plan, municipal water conservation is projected to meet 9.6 percent[1] of the state's future water needs by 2070. According to the 16 regional water plans that comprise the state water plan, this is expected to be achieved through a variety of measures such as installation of water efficient plumbing fixtures, water conservation pricing structures, water system audits, landscape irrigation ordinances, as well as other water conservation activities. The 9.6 percent is "in addition to the estimated share of future passive conservation savings from plumbing codes and water efficiency standards, which are embedded in municipal water demand projections" (Texas Water Development Board, 2017).

In 2015, the Texas Legislature appropriated funds to the Texas Water Development Board (TWDB) to fund a research project principally charged with quantitatively determining the savings of municipal water conservation activities being implemented in relation to the recommended conservation goals (supply volumes) in the State Water Plan. As part of the project, individual reports were completed for all participating utilities.

With this report, utilities will benefit by receiving a clear and concise picture of its water conservation goals alongside estimated savings from quantifiable activities. In the event that current activity savings may not be able to reach long-term goals, this report offers suggestions on how utilities can reach water conservation goals with activities that are effective, easily adopted, have widespread appeal, and are quantifiable.

2 Municipal Conservation Terminology and Review of Methodology Used by Regional Planners

To make use of the results of this study, it is important to understand several key terms used in the water planning process.

What is a water user group?

In this report, a water user group (WUG) refers to a retail water provider in the form a city, municipal utility district, water control and improvement district, special utility district, water supply corporation, fresh water supply district, or other type of water utility. The TWDB further defines WUGs as one of the following (Texas Water Development Board, 2016b):

- Cities and towns with a population of 500 or more
- Non-city utilities providing more than 280 acre-feet per year per year of water for municipal use
- Collective reporting units (CRUs) consisting of grouped utilities having a common association

[1] Equal to 811,224 acre-feet per year in conservation savings.

- County-Wide WUGs:
  - County-Other (Rural/unincorporated areas of municipal water use)
  - Manufacturing
  - Steam electric power generation

What is a recommended water management strategy?

A recommended water management strategy (WMS) is a measure that will help ensure WUGs have adequate water supplies for their end users well into the future. WMS examples include river diversions, groundwater use, reservoir and aquifer development, and irrigation conservation. When WMS is referred to in this report, it refers only to municipal conservation, which may include water loss reduction as a part of the same strategy.

What is a WMS supply volume?

A WMS supply volume is the amount of water that a given strategy is expected to yield each decade in the planning period if carried out by the WUG. In this report, a WMS supply volume is the amount of water recommended to come from municipal water conservation.

Some regional water plans separate this strategy's supply volume into a volume for municipal water conservation and a volume for water loss reduction for each decade. The total strategy supply volume is the sum of both. A regional water plan may also refer to "advanced conservation" as part of this strategy. Advanced conservation usually indicates that the volume could be achieved through a more robust mix of conservation activities described in the plan.

2.1 Regional Planning Group Approach to Determining Supply Volumes

Each regional water planning group (RWPG) is responsible for producing its own individual plan that, if executed, will provide sufficient water to its WUGs throughout a 50-year planning period. These plans are completed in five-year cycles, with the most recent edition being completed in 2016. The 2016 regional plans make up the 2017 State Water Plan, which sets out WMS supply volumes for the years 2020 through 2070.

The decadal WMS supply volumes for municipal conservation were established by each of the RWPGs in much the same manner. The RWPGs generally followed the guidelines of the Texas Legislature's Water Conservation Implementation Task Force on the pace utilities should target to reduce gallons per capita per day (GPCD)[2] consumption levels.

The targeted reductions used by most regions follow this formula:

- For municipal WUGs with water use of 140 GPCD and greater, the goal is to reduce per capita water use by one percent per year until the level of 140 GPCD is reached,

[2] Regional water planning GPCD is defined as the annual volume of water pumped, diverted, or purchased minus the volume exported (sold) to other water systems or large industrial facilities divided by the permanent resident population of the Municipal Water User Group in the regional water planning process divided by 365. Saline and reused/recycled water are not included in this volume (Texas Water Development Board, 2012).

after which, the goal is to reduce per capita water use by one-fourth percent per year for the remainder of the planning period (Texas Water Development Board, 2016j).

The yearly reductions in GPCD for a given WUG are then converted into recommended supply volumes in acre-feet per year for each decade as the reductions in consumption continue. Some regions reduce GPCD by slightly different percentages before and after the 140 GPCD threshold, some do not apply further reductions in GPCD for WUGs once they reach 140 GPCD, while others recommend only "advanced conservation" activities once WUGs meet 140 GPCD.

2.2 Methodology

In order to complete a uniform quantification process, the first engagement was with utilities that agreed to participate and collected as much relevant data as possible. These data included, among many others, historical GPCD consumption figures, advanced metering infrastructure (AMI) specifications, and detailed feedback on each conservation activity being implemented. Personal interviews focused on determining when and to what extent these activities were being employed, as well as assessing plans to continue such conservation. Examples of frequently implemented activities include tiered water rate conservation pricing, strategic water rate increases, outdoor irrigation audits and ordinances, and rain barrel distribution.

Subsequently, each utility's conservation activities were quantified through several different means, including evidence-based studies, utility field results and savings determinations, manufacturer guarantees, water loss audits, TWDB studies, and other information that assigned a savings value to the activity's implementation.

Every conservation activity studied and quantified has a gallons-per-year estimate, useful life, and decay rate (if applicable) associated with it. Some activities' savings are projected to grow as demand grows over time, while some savings are constant each year and subside once useful life has run its course. For expanded methodology and details on studies and formulas used to determine activity savings, refer to Section 6 of the State Report included as part of this document.

Once analyzed, the resulting savings estimates from each utility were compared with the recommended WMS supply volumes in its respective regional plan to determine if the savings met, exceeded, or fell short of those volumes. Individual utility savings were aggregated to compare with regional volumes, and regional savings were aggregated to compare with state volumes.

It is important to note that this report quantified activity savings—not including water loss reduction—for the WMS supply volume comparison dating back to 2012. The reason for this is, with a few exceptions, the regional planners used 2011 as the base year for establishing potential WMS supply volumes.[3] In addition, any conservation savings achieved through 2011 are assumed to be accounted for in the regional water planning GPCD for that year.[4] Thus, quantifying from 2012 and forward is the most accurate way to determine if utilities are meeting

[3] Confirmed via personal communication with Region C, H, K, and L Plan consultants.
[4] It was established with TWDB planning staff that 2011 GPCD levels were chosen because they represented the most current water use and conservation patterns at the time.

the recommended conservation volumes in the regional plans. This assumption is by no means 100 percent accurate, however. Some previously implemented activities' savings persist into future years beyond this starting point, while some activities' savings have ceased. One year's GPCD will not necessarily include all savings yielded by conservation activities that came before it, but the quantification assessment must have a starting point.

2.3 Quantifiable Savings

The key to the project being useful and reliable is that the results from year to year are measurable. Quantifying conservation activities that can be accurately measured provides greater certainty and better planning for all stakeholders.

While many utilities are engaged in a variety of conservation activities, not all can currently be properly measured. Some examples of these activities include education initiatives, website and social media engagement, and enforcement for water waste. That does not mean these measures are not essential. Education of consumers, for example, is a fundamental activity that makes all others effective, but little hard data exists to quantify the results of education alone.

In addition, the work of conservation coordinators can have a particularly significant effect on the savings of all other activities, but the specific savings attributed to that staff role is difficult to quantify.

3 Results

This report compares Atascosa Rural WCS's current water conservation activities and their quantified savings to two metrics: 1) Region L Water Plan's (Texas Water Development Board, 2016j) recommended WMS supply volumes for municipal conservation, and 2) Atascosa Rural WCS's own 5- and 10-year goals as established in its most recent water conservation plan submitted to the TWDB.

The WMS supply volumes for municipal water conservation are laid out by decade (2020 – 2070) in the regional water plans to serve as benchmarks for what each utility could achieve via that strategy during a 50-year planning period.[5]

The 5- and 10-year goals in Atascosa Rural WCS's most recent water conservation plan are established by the utility as realistic targets for reducing consumption over that timeframe. These reductions[6] are expressed in decreasing total GPCD [7] consumption and water loss GPCD.[8] [9]

---

[5] Some regional water plans separate this strategy volume into a volume for water conservation and a volume for water loss reduction for each decade. The total strategy volume is the sum of both.

[6] Occasionally, some utilities expect consumption to increase due to various reasons, such as an incoming industrial presence expected to raise consumption figures for the entire service area.

[7] As defined in TWDB water conservation plan annual report (Texas Water Development Board, 2016o): (Total Gallons in System ÷ Permanent Population) ÷ 365

[8] These plans also have targets for residential GPCD and water loss as a percentage (rather than GPCD), but this report does not address those goals.

[9] As defined in TWDB water conservation plan annual report (Texas Water Development Board, 2016o): (Total Water Loss ÷ Permanent Population) ÷ 365

The estimated savings in Tables 3-1 through 3-3 indicate the best information available as provided by utility staff. Some ongoing activities may not be known and are within a utility's service area are implemented on a micro-scale that may not be quantified. Individual households and businesses may be implementing conservation measures that are unknown and therefore cannot be included in the report.

Explanation of approach to assessing water loss reduction savings

Water loss reduction savings are defined as the volume of water participating utilities are realizing from their water loss mitigation efforts. For this report, this value is the difference between each individual utility's baseline[10] for water loss GPCD and its most recent water loss GPCD reported in 2015 water loss audits on file with TWDB. Savings from all water loss reduction efforts—including pipe replacements and leak repair—are assumed to be included in this comparison to a utility's baseline.

Note that because a single year (2015) value was used for comparison, it is possible that the 2015 value could be anomalous due to a number of events that may have occurred that year, such as a water main break, a particularly wet year, or a robust effort by the utility to curtail water loss. This will distort future savings figures that were carried forward in the study because water loss will inevitably increase or decrease in later years.

Ideally, using a rolling five-year average in the calculation would correct such anomalies. However, there was insufficient data to do that for every utility. The approach was to use the most complete water loss data possible, which was represented by the 2015 water loss audit. This problem will be further minimized, as continued data collection will allow five-year averages to be calculated for a majority of utilities.

In this way, water loss savings estimates are different from all other activity savings estimates in the project. Whether savings were positive or negative depended on where individual utilities established their own baselines or where their five-year average started, and what water loss GPCD value was reported in 2015.

3.1 Current Savings Compared to Conservation WMS Supply Volume (in million gallons) in Regional Water Plan

Table 3-1 shows the 2070 outlook for Atascosa Rural WCS with the utility's yearly recommended WMS supply volume in million gallons (MG) alongside its water savings from implemented activities, including from water loss reduction. These activities and their associated savings are covered in greater detail in Sections 4 and 5.

Starting in 2015, this table compares all quantified conservation activity and the recommended conservation WMS supply volume for the planning period. The following definitions pair with the column headers in Table 3-1.

Actual Current Conservation Activity Savings – All quantified activities currently being

[10] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.

performed by the utility, *excluding* savings from water loss reduction. The regional planners used 2011 GPCD as the baseline for determining future conservation WMS supply volumes, therefore the study quantifies utility savings starting in 2012 for this comparison.

Actual Water Loss Reduction Savings (as of 2015) – The difference between the baseline[11] for water loss GPCD and most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB. [12] The summary of these savings can be referenced in Table 5-1.

Total Savings from All Conservation Activity – Actual Current Conservation Activity Savings plus Actual Water Loss Reduction Savings (as of 2015).

Conservation WMS Volume – The recommended municipal water conservation supply volume in the regional plan for the decades ranging from 2020 to 2070. These volumes are converted to MG from the values listed in the plan in acre-feet and then calculated in annual increments.

Water Loss Reduction WMS Volume – Some regional water plans have a separate WMS volume for water conservation and for water loss reduction for each decade. If a WUG's regional plan has a WMS volume for water loss reduction, this column will have values other than zero.

Total Yearly WMS Volume – The sum of the Conservation WMS Volume and Water Loss Reduction WMS Volume.

Over (Short) – The amount that the utility's Total Savings from All Conservation Activity (since 2012), is over or below the Total Yearly WMS Volume in the regional water plan. If the amount falls below the WMS volume, it will appear in parentheses.

[11] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.
[12] If water loss GPCD has increased from the utility's baseline or historic five-year average to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount.

Table 3-1. Current Savings Compared to Conservation WMS Supply Volume (MG) in Regional Water Plan.

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)

3.2 Utility Water Conservation Plan Goals – Total GPCD

Table 3-2 shows how Atascosa Rural WCS's quantified savings from its implemented activities compare with 5- and 10-year goals established in its individual water conservation plan submitted to the TWDB. The following definitions pair with the column headers in Table 3-2.

Utility Population – Estimated utility service area population for the years indicated.

Total GPCD Goals – Total GPCD goals start with the utility's baseline[13] for total GPCD and progress in subsequent years to match 5- and 10-year goals indicated in a utility's five-year water conservation plan on file with the TWDB. The first five annual GPCD goals were developed by spreading the difference between the baseline and five-year goal evenly over five years. The second five annual GPCD goals spread the difference between the five-year goal and 10-year goal evenly over the next five years.

Annual Savings Goal with Reduction in GPCD (MG) – This column shows what reductions from the baseline GPCD would yield in terms of volume each year as more water is saved. The volumes indicated here are what target GPCD goals look like expressed in million gallons. Annual volumes were derived using the formula: (baseline total GPCD – target total GPCD for that year) x 365 days ÷ 1,000,000 gallons.

Total Savings for All Current Quantified Activities (MG) – Total quantified savings for all current conservation activities and savings from water loss reduction.

Over (Short) – The amount that the utility's total quantified savings for all current conservation activities (since 2012), including water loss reduction, is over or below the volume represented by reductions in GPCD each year. If the quantified savings are less than these target volumes, the value will appear in parentheses.

Table 3-2. Utility Water Conservation Plan Goals — Total GPCD.

Year #	Year	Utility Population	Total GPCD Goals	Annual Savings Goal with Reduction in GPCD (MG)	Total Savings for All Current Quantified Activities (MG)	Over (Short) (MG)
0	**Baseline**	-	105	0	0	0
1	2015	13,492	104	5	2	(2)
2	2016	13,311	103	10	2	(7)
3	2017	13,129	102	14	2	(12)
4	2018	12,948	101	19	2	(17)
5-year Goal	2019	12,766	100	23	2	(21)
6	2020	12,585	99	28	2	(25)
7	2021	12,846	98	33	2	(30)
8	2022	13,107	97	38	2	(36)
9	2023	13,368	96	44	2	(41)
10-year Goal	2024	13,629	95	50	2	(47)

[13] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for total GPCD from the utility's most recently submitted five-year water conservation plan was used.

3.3 Utility Water Conservation Plan Goals – Water Loss GPCD

Table 3-3 shows how Atascosa Rural WCS's most recent water loss audit compares with five- and 10-year water loss goals in its water conservation plan. The following definitions pair with the column headers in Table 3-2.

Utility Population – Estimated utility service area population for the years indicated.

Water Loss GPCD Goals – Water loss GPCD goals start with the utility's baseline[14] for water loss GPCD and progress in subsequent years to match 5- and 10-year water loss goals indicated in a utility's five-year water conservation plan on file with the TWDB. The first five annual GPCD goals were developed by spreading the difference between the baseline and five-year goal evenly over five years. The second five annual GPCD goals spread the difference between the five-year goal and 10-year goal evenly over the next five years.

Yearly Savings Goal with Reduction in GPCD (MG) – This column shows what reductions from the baseline water loss GPCD would yield in terms of volume each year as more water is saved. The volumes indicated here are what target water loss GPCD goals look like expressed in million gallons. Annual volumes were derived using the formula: (baseline water loss GPCD – target water loss GPCD for that year) x 365 days ÷ 1,000,000 gallons.

Total Savings from Water Loss Reduction (MG) – The difference between a utility's established baseline for water loss GPCD and the most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB. If water loss GPCD has increased from the utility's baseline to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount. Reference Table 5-1 for savings from water loss reduction.

Over (Short) – The amount that the utility's total savings from water loss reduction is over or below the volume represented by reductions in GPCD each year. If water loss reduction savings are less than these target volumes, the value will appear in parentheses.

Table 3-3. Utility Water Conservation Plan Goals — Water Loss GPCD.

Year #	Year	Utility Population	Water Loss GPCD Goals	Yearly Savings Goal with Reduction in GPCD (MG)	Total Savings from Water Loss Reduction (MG)	Over (Short) (MG)
0	**Baseline**	-	12.50	0	0	0
1	2015	13,492	12	4	2	(2)
2	2016	13,311	11	8	2	(6)
3	2017	13,129	10	12	2	(10)
4	2018	12,948	9	16	2	(14)
5-year Goal	2019	12,766	8	20	2	(17)
6	2020	12,585	8	22	2	(20)
7	2021	12,846	7	25	2	(23)
8	2022	13,107	7	29	2	(26)
9	2023	13,368	6	32	2	(30)
10-year Goal	2024	13,629	5	36	2	(33)

[14] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.

4 Implemented Activities

Below is a list of completed activities with estimated water savings. Note that drought response and other measures are not included in the utility's water savings because they are temporary, awareness-based or not able to be accurately quantified on an annual basis.

These are not savings projections of potential future activities. Estimated savings are based on measures that have actually been implemented. If savings are shown to persist in future years, it is because the measure is permanent, such as an ordinance, or the savings are assumed to continue for the reason listed under the itemized activity. Estimated savings from water rate increases are the one exception to these conditions.

Water Rate Increases

Savings from water rate increases were included because entities such as the U.S. Environmental Protection Agency and others indicate specific savings for utilities that raise rates (Texas Water Development Board, 2013; U.S. E.P.A., 1998; Whitcomb, 1999). This project includes surveys of several utilities that have minimal education efforts, perform no other substantive conservation activities, and yet experienced significant demand reduction that coincided with rate increases. In those cases, savings estimates matched up closely with decreases in total GPCD. For many smaller utilities, especially those with customers lacking disposable income, this measure is the only tool used to conserve other than water loss reduction.

The following assumptions were made for water rate increases:

- The model assumes that savings persist into future years because it is expected that the utility will continue to make periodic rate increases in line with the percentage increases from previous years.
- Only the last two rate increases for a utility were quantified.
- Savings grow with demand because as new customers enter the service area, they are assumed to adhere to the same price elasticity model estimates.
- A weighted average for savings was used when rate increases differed between residential and industrial-commercial-institutional (ICI) customers based on the individual utility's customer class breakdown.
- When a utility raised rates using tiered rate conservation pricing, a 50/50 savings split was used when increases differed between base and volumetric rates.
    - The reasoning is that all customers must react to the base increase, yet the pricing signal is stronger when volumetric rate increases affect the higher usage customers.
    - The 50/50 split is reasonable because many customers will not reach the higher volumetric tiers.
    - Studies show that most customers do not actually know they have reached the higher volumetric tiers; just that their bill has increased (Texas Water Development Board, 2013).

4.1 Itemized Activities

1. **Utility Website**
    a. Easy-to-use website with conservation tips and water rates
    b. Features contact information for Public Works staff and customer service

2. **Continuing Public Education**
    a. The utility engages the public in many ways including:
        i. Brochures, bill messages, displays, and exhibits

3. **Water Loss Reduction Savings**[15]
    a. Savings of 2 MG annually in 2015
    b. Water loss reduction savings = the difference between a utility's baseline[16] water loss GPCD submitted in its most recent 5-year water conservation plan and its most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB
    c. If water loss GPCD has increased from the utility's baseline or historic 5-year average to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount.
    d. All savings estimates grow each year at the same rate population figures for the utility grow in the regional water plan.

[15] If current water loss levels exceed a utility's baseline, this value is treated as a deduction from total quantified savings.

[16] In the absence of having a baseline figure provided in the utility's most recently submitted 5-year water conservation plan, the historic 5-year average for water loss GPCD in the plan was used.

5 Summary of Savings

Table 5-1. Savings from Water Loss Reduction (MG).

Year	Utility Population	Water Loss GPCD	Total Savings from Water Loss Reduction
Baseline	-	12.50	0
2015	13,492	12.00	2
2016	13,311	12.00	2
2017	13,129	12.00	2
2018	12,948	12.00	2
2019	12,766	12.00	2
2020	12,585	12.00	2
2021	12,846	12.00	2
2022	13,107	12.00	2
2023	13,368	12.00	2
2024	13,629	12.00	2

6 Suggested Activities

Up to four activities were chosen as potential suggested activities for individual reports. These activities are: AMI system with customer portal, twice-per-week (or less) outdoor watering ordinances, strategic water rate increases, and rain barrels.

Activities were chosen because they are:

- Achievable
- Prevalence of vendors that can actually implement them
- Acceptability to city councils, MUD boards, et al.
- Easily adopted
- Cost effective
- Yield high savings relative to cost

AMI systems with customer engagement portals were also chosen because they represent a profusion of future applications that will undoubtedly continue to advance conservation efforts. AMI and meter data management (MDM) companies are developing new and innovative ways to benefit water providers, customers, and ultimately states that are pushing conservation and usage analytics further.

Each utility should be cognizant of the potential impact that these suggested activities may have on its own unique rate and revenue situation.

Benefits to consider:

- Avoided water supply and wastewater costs
  - The higher water purchase, transmission, and distribution costs are, the greater the potential benefit realized when large amounts of water are conserved with these activities.

- Avoided system expansion costs
    - Conserving water may allow a utility to postpone building new system capacity by decreasing demand even as population grows.

Costs to consider:

- Staff time and resources
- Unit cost per unit saved
- Implementation costs
- Stakeholder agreement and support
- Other overhead and budget considerations

6.1 Suggested Activities with Savings Estimates

1. Twice-a-week Outdoor Watering Restriction Ordinance

a. Potentially 6.11% savings of total demand (Hermitte and Mace, 2012; Sierra Club-Lone Star Chapter and National Wildlife Federation, 2015)

i. Average Region L savings

ii. Specific percentage of outdoor usage unknown for your utility at this time

b. Savings could be 30 MG per year with current demand.

c. See Table 6-1 for potential savings from this measure compared with the city's WMS supply volumes targets.

Table 6-1. Current Savings + Potential Savings from 2x per Week Watering Ordinance (MG).

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Potential Savings from Ordinance	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)
2016	0	2	2	30	0	0	0	32
2017	0	2	2	30	0	0	0	33
2018	0	2	2	31	0	0	0	33
2019	0	2	2	31	0	0	0	34
2020	0	2	2	32	0	0	0	34
2021	0	2	2	32	0	0	0	35
2022	0	2	2	33	0	0	0	35
2023	0	2	2	33	0	0	0	36
2024	0	2	2	34	0	0	0	36
2025	0	3	3	35	0	0	0	37
2026	0	3	3	35	0	0	0	38
2027	0	3	3	36	0	0	0	38
2028	0	3	3	36	0	0	0	39
2029	0	3	3	37	0	0	0	40
2030	0	3	3	37	0	0	0	40
2031	0	3	3	38	0	0	0	41
2032	0	3	3	38	0	0	0	41
2033	0	3	3	39	0	0	0	42
2034	0	3	3	39	0	0	0	42
2035	0	3	3	40	0	0	0	43
2036	0	3	3	40	0	0	0	44
2037	0	3	3	41	0	0	0	44
2038	0	3	3	42	0	0	0	45
2039	0	3	3	42	0	0	0	45
2040	0	3	3	43	0	0	0	46

2. Advanced Metering Infrastructure with Customer Engagement Portal

These portals, along with mobile applications and billing statements, can provide customers with much more access to their water use data in simple and compelling formats. This access and comparison with other customers' usage can reduce water use through changed behavior, as well as provide an opportunity for other conservation programs to be offered to the customer for increased adoption and additional savings. AMI systems support leak notification and web portals with real-time data. Any water loss reduction savings that these systems also yield were included in the water loss assessment of individual reports for this project.

- **a.** Specific utility results will vary based on portal features and frequency of customer notifications
- **b.** Potential savings estimate assumes 20% of residential customers will use and save water due to the portal (Westin Engineering, 2015)
- **c.** Estimate assumes customers will save 10% of total annual use due to the portal
    - i. Savings estimate of 10% is an average of results from multiple studies (Chesnutt and Mitchell, 2013; East Bay Municipal Utility District, 2014; IBM, 2011; Texas A&M and Texas Water Resources Institute, 2016; Westin Engineering, 2015)
- **d.** Residential customers' use assumed to make up approximately 67% of all retail customers' use based on utility profile information submitted to the TWDB
    - i. This was the most common percentage of residential use among participating utilities in this project.
    - ii. Actual customer class demand percentages will vary by utility.
- **e.** 20% of residential customers saving 10% with this customer class breakdown amounts to 1.34% of total demand
- **f.** Savings are assumed to increase along with demand as connections increase each year[17]
- **g.** See Table 6-2 for potential savings from this measure compared with the utility's WMS supply volumes targets.

[17] The 10% consumption reduction figure for 20% of residential customers is conservative, but savings could be greater when monitored yearly as customer engagement increases.

Table 6-2. Current Savings + Potential Savings from AMI with Customer Portal (MG).

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Potential Savings from AMI with Customer Portal	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)

3. Water Rate Increase
- **a.** For every 10% increase, estimated savings could be 2% of utility total demand.
- **b.** Approximately 10 MG of savings per year with current demand
- **c.** Savings is cumulative and based on more than one source[18] (U.S. EPA, 1998; Whitcomb, 1999)
- **d.** See Table 6-3 for potential savings from this measure compared with the utility's conservation goals.

[18] The study estimates a 2% demand reduction with 10% increase in price on a targeted customer class. By applying a ratio, it is possible to determine the savings for lower or higher percentage increases.

Table 6-3. Current Savings + Potential Savings from 10% Water Rate Increase (MG).

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Potential Savings from Water Rate Increase	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)

4. Rain Barrels
   a. In Region L, utilities could save approximately 17 gallons per year per gallon of capacity rebated, sold, or distributed (GDS Associates, 2002).
   b. Estimated 10-year useful life for most barrels

Statewide Water Conservation Quantification Project
Crystal Clear SUD Report • 2017

1 Introduction

In Texas' 2017 State Water Plan, municipal water conservation is projected to meet 9.6 percent[1] of the state's future water needs by 2070. According to the 16 regional water plans that comprise the state water plan, this is expected to be achieved through a variety of measures such as installation of water efficient plumbing fixtures, water conservation pricing structures, water system audits, landscape irrigation ordinances, as well as other water conservation activities. The 9.6 percent is "in addition to the estimated share of future passive conservation savings from plumbing codes and water efficiency standards, which are embedded in municipal water demand projections" (Texas Water Development Board, 2017).

In 2015, the Texas Legislature appropriated funds to the Texas Water Development Board (TWDB) to fund a research project principally charged with quantitatively determining the savings of municipal water conservation activities being implemented in relation to the recommended conservation goals (supply volumes) in the State Water Plan. As part of the project, individual reports were completed for all participating utilities.

With this report, utilities will benefit by receiving a clear and concise picture of its water conservation goals alongside estimated savings from quantifiable activities. In the event that current activity savings may not be able to reach long-term goals, this report offers suggestions on how utilities can reach water conservation goals with activities that are effective, easily adopted, have widespread appeal, and are quantifiable.

2 Municipal Conservation Terminology and Review of Methodology Used by Regional Planners

To make use of the results of this study, it is important to understand several key terms used in the water planning process.

What is a water user group?

In this report, a water user group (WUG) refers to a retail water provider in the form a city, municipal utility district, water control and improvement district, special utility district, water supply corporation, fresh water supply district, or other type of water utility. The TWDB further defines WUGs as one of the following (Texas Water Development Board, 2016b):

- Cities and towns with a population of 500 or more
- Non-city utilities providing more than 280 acre-feet per year per year of water for municipal use
- Collective reporting units (CRUs) consisting of grouped utilities having a common association

[1] Equal to 811,224 acre-feet per year in conservation savings.

- County-Wide WUGs:
    - County-Other (Rural/unincorporated areas of municipal water use)
    - Manufacturing
    - Steam electric power generation

What is a recommended water management strategy?

A recommended water management strategy (WMS) is a measure that will help ensure WUGs have adequate water supplies for their end users well into the future. WMS examples include river diversions, groundwater use, reservoir and aquifer development, and irrigation conservation. When WMS is referred to in this report, it refers only to municipal conservation, which may include water loss reduction as a part of the same strategy.

What is a WMS supply volume?

A WMS supply volume is the amount of water that a given strategy is expected to yield each decade in the planning period if carried out by the WUG. In this report, a WMS supply volume is the amount of water recommended to come from municipal water conservation.

Some regional water plans separate this strategy's supply volume into a volume for municipal water conservation and a volume for water loss reduction for each decade. The total strategy supply volume is the sum of both. A regional water plan may also refer to "advanced conservation" as part of this strategy. Advanced conservation usually indicates that the volume could be achieved through a more robust mix of conservation activities described in the plan.

2.1 Regional Planning Group Approach to Determining Supply Volumes

Each regional water planning group (RWPG) is responsible for producing its own individual plan that, if executed, will provide sufficient water to its WUGs throughout a 50-year planning period. These plans are completed in five-year cycles, with the most recent edition being completed in 2016. The 2016 regional plans make up the 2017 State Water Plan, which sets out WMS supply volumes for the years 2020 through 2070.

The decadal WMS supply volumes for municipal conservation were established by each of the RWPGs in much the same manner. The RWPGs generally followed the guidelines of the Texas Legislature's Water Conservation Implementation Task Force on the pace utilities should target to reduce gallons per capita per day (GPCD)[2] consumption levels.

The targeted reductions used by most regions follow this formula:

- For municipal WUGs with water use of 140 GPCD and greater, the goal is to reduce per capita water use by one percent per year until the level of 140 GPCD is reached,

[2] Regional water planning GPCD is defined as the annual volume of water pumped, diverted, or purchased minus the volume exported (sold) to other water systems or large industrial facilities divided by the permanent resident population of the Municipal Water User Group in the regional water planning process divided by 365. Saline and reused/recycled water are not included in this volume (Texas Water Development Board, 2012).

> after which, the goal is to reduce per capita water use by one-fourth percent per year for the remainder of the planning period (Texas Water Development Board, 2016j).

The yearly reductions in GPCD for a given WUG are then converted into recommended supply volumes in acre-feet per year for each decade as the reductions in consumption continue. Some regions reduce GPCD by slightly different percentages before and after the 140 GPCD threshold, some do not apply further reductions in GPCD for WUGs once they reach 140 GPCD, while others recommend only "advanced conservation" activities once WUGs meet 140 GPCD.

2.2 Methodology

In order to complete a uniform quantification process, the first engagement was with utilities that agreed to participate and collected as much relevant data as possible. These data included, among many others, historical GPCD consumption figures, advanced metering infrastructure (AMI) specifications, and detailed feedback on each conservation activity being implemented. Personal interviews focused on determining when and to what extent these activities were being employed, as well as assessing plans to continue such conservation. Examples of frequently implemented activities include tiered water rate conservation pricing, strategic water rate increases, outdoor irrigation audits and ordinances, and rain barrel distribution.

Subsequently, each utility's conservation activities were quantified through several different means, including evidence-based studies, utility field results and savings determinations, manufacturer guarantees, water loss audits, TWDB studies, and other information that assigned a savings value to the activity's implementation.

Every conservation activity studied and quantified has a gallons-per-year estimate, useful life, and decay rate (if applicable) associated with it. Some activities' savings are projected to grow as demand grows over time, while some savings are constant each year and subside once useful life has run its course. For expanded methodology and details on studies and formulas used to determine activity savings, refer to Section 6 of the State Report included as part of this document.

Once analyzed, the resulting savings estimates from each utility were compared with the recommended WMS supply volumes in its respective regional plan to determine if the savings met, exceeded, or fell short of those volumes. Individual utility savings were aggregated to compare with regional volumes, and regional savings were aggregated to compare with state volumes.

It is important to note that this report quantified activity savings—not including water loss reduction—for the WMS supply volume comparison dating back to 2012. The reason for this is, with a few exceptions, the regional planners used 2011 as the base year for establishing potential WMS supply volumes.[3] In addition, any conservation savings achieved through 2011 are assumed to be accounted for in the regional water planning GPCD for that year.[4] Thus, quantifying from 2012 and forward is the most accurate way to determine if utilities are meeting

[3] Confirmed via personal communication with Region C, H, K, and L Plan consultants.

[4] It was established with TWDB planning staff that 2011 GPCD levels were chosen because they represented the most current water use and conservation patterns at the time.

the recommended conservation volumes in the regional plans. This assumption is by no means 100 percent accurate, however. Some previously implemented activities' savings persist into future years beyond this starting point, while some activities' savings have ceased. One year's GPCD will not necessarily include all savings yielded by conservation activities that came before it, but the quantification assessment must have a starting point.

2.3 Quantifiable Savings

The key to the project being useful and reliable is that the results from year to year are measurable. Quantifying conservation activities that can be accurately measured provides greater certainty and better planning for all stakeholders.

While many utilities are engaged in a variety of conservation activities, not all can currently be properly measured. Some examples of these activities include education initiatives, website and social media engagement, and enforcement for water waste. That does not mean these measures are not essential. Education of consumers, for example, is a fundamental activity that makes all others effective, but little hard data exists to quantify the results of education alone.

In addition, the work of conservation coordinators can have a particularly significant effect on the savings of all other activities, but the specific savings attributed to that staff role is difficult to quantify.

3 Results

This report compares Crystal Clear SUD's current water conservation activities and their quantified savings to two metrics: 1) Region L Water Plan's (Texas Water Development Board, 2016j) recommended WMS supply volumes for municipal conservation, and 2) Crystal Clear SUD's own 5- and 10-year goals as established in its most recent water conservation plan submitted to the TWDB.

The WMS supply volumes for municipal water conservation are laid out by decade (2020 – 2070) in the regional water plans to serve as benchmarks for what each utility could achieve via that strategy during a 50-year planning period.[5]

The 5- and 10-year goals in Crystal Clear SUD's most recent water conservation plan are established by the utility as realistic targets for reducing consumption over that timeframe. These reductions[6] are expressed in decreasing total GPCD [7] consumption and water loss GPCD.[8] [9]

---

[5] Some regional water plans separate this strategy volume into a volume for water conservation and a volume for water loss reduction for each decade. The total strategy volume is the sum of both.

[6] Occasionally, some utilities expect consumption to increase due to various reasons, such as an incoming industrial presence expected to raise consumption figures for the entire service area.

[7] As defined in TWDB water conservation plan annual report (Texas Water Development Board, 2016o): (Total Gallons in System ÷ Permanent Population) ÷ 365

[8] These plans also have targets for residential GPCD and water loss as a percentage (rather than GPCD), but this report does not address those goals.

[9] As defined in TWDB water conservation plan annual report (Texas Water Development Board, 2016o): (Total Water Loss ÷ Permanent Population) ÷ 365

The estimated savings in Tables 3-1 through 3-3 indicate the best information available as provided by utility staff. Some ongoing activities may not be known and are within a utility's service area are implemented on a micro-scale that may not be quantified. Individual households and businesses may be implementing conservation measures that are unknown and therefore cannot be included in the report.

Explanation of approach to assessing water loss reduction savings

Water loss reduction savings are defined as the volume of water participating utilities are realizing from their water loss mitigation efforts. For this report, this value is the difference between each individual utility's baseline[10] for water loss GPCD and its most recent water loss GPCD reported in 2015 water loss audits on file with TWDB. Savings from all water loss reduction efforts—including pipe replacements and leak repair—are assumed to be included in this comparison to a utility's baseline.

Note that because a single year (2015) value was used for comparison, it is possible that the 2015 value could be anomalous due to a number of events that may have occurred that year, such as a water main break, a particularly wet year, or a robust effort by the utility to curtail water loss. This will distort future savings figures that were carried forward in the study because water loss will inevitably increase or decrease in later years.

Ideally, using a rolling five-year average in the calculation would correct such anomalies. However, there was insufficient data to do that for every utility. The approach was to use the most complete water loss data possible, which was represented by the 2015 water loss audit. This problem will be further minimized, as continued data collection will allow five-year averages to be calculated for a majority of utilities.

In this way, water loss savings estimates are different from all other activity savings estimates in the project. Whether savings were positive or negative depended on where individual utilities established their own baselines or where their five-year average started, and what water loss GPCD value was reported in 2015.

3.1 Current Savings Compared to Conservation WMS Supply Volume (in million gallons) in Regional Water Plan

Table 3-1 shows the 2070 outlook for Crystal Clear SUD with the utility's yearly recommended WMS supply volume in million gallons (MG) alongside its water savings from implemented activities, including from water loss reduction. These activities and their associated savings are covered in greater detail in Sections 4 and 5.

Starting in 2015, this table compares all quantified conservation activity and the recommended conservation WMS supply volume for the planning period. The following definitions pair with the column headers in Table 3-1.

<u>Actual Current Conservation Activity Savings</u> – All quantified activities currently being

[10] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.

performed by the utility, *excluding* savings from water loss reduction. The regional planners used 2011 GPCD as the baseline for determining future conservation WMS supply volumes, therefore the study quantifies utility savings starting in 2012 for this comparison. The summary of these savings can be referenced in Table 5-1.

<u>Actual Water Loss Reduction Savings (as of 2015)</u> – The difference between the baseline[11] for water loss GPCD and most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB. [12] The summary of these savings can be referenced in Table 5-2.

<u>Total Savings from All Conservation Activity</u> – Actual Current Conservation Activity Savings plus Actual Water Loss Reduction Savings (as of 2015).

<u>Conservation WMS Volume</u> – The recommended municipal water conservation supply volume in the regional plan for the decades ranging from 2020 to 2070. These volumes are converted to MG from the values listed in the plan in acre-feet and then calculated in annual increments.

<u>Water Loss Reduction WMS Volume</u> – Some regional water plans have a separate WMS volume for water conservation and for water loss reduction for each decade. If a WUG's regional plan has a WMS volume for water loss reduction, this column will have values other than zero.

<u>Total Yearly WMS Volume</u> – The sum of the Conservation WMS Volume and Water Loss Reduction WMS Volume.

<u>Over (Short)</u> – The amount that the utility's Total Savings from All Conservation Activity (since 2012), is over or below the Total Yearly WMS Volume in the regional water plan. If the amount falls below the WMS volume, it will appear in parentheses.

---

[11] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.
[12] If water loss GPCD has increased from the utility's baseline or historic five-year average to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount.

Table 3-1. **Current Savings Compared to Conservation WMS Supply Volume (MG) in Regional Water Plan.**

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)

3.2 Utility Water Conservation Plan Goals – Total GPCD

Table 3-2 shows how Crystal Clear SUD's quantified savings from its implemented activities compare with 5- and 10-year goals established in its individual water conservation plan submitted to the TWDB. The following definitions pair with the column headers in Table 3-2.

Utility Population – Estimated utility service area population for the years indicated.

Total GPCD Goals – Total GPCD goals start with the utility's baseline[13] for total GPCD and progress in subsequent years to match 5- and 10-year goals indicated in a utility's five-year water conservation plan on file with the TWDB. The first five annual GPCD goals were developed by spreading the difference between the baseline and five-year goal evenly over five years. The second five annual GPCD goals spread the difference between the five-year goal and 10-year goal evenly over the next five years.

Annual Savings Goal with Reduction in GPCD (MG) – This column shows what reductions from the baseline GPCD would yield in terms of volume each year as more water is saved. The volumes indicated here are what target GPCD goals look like expressed in million gallons. Annual volumes were derived using the formula: (baseline total GPCD – target total GPCD for that year) x 365 days ÷ 1,000,000 gallons.

Total Savings for All Current Quantified Activities (MG) – Total quantified savings for all current conservation activities and savings from water loss reduction. Refer to Tables 5-1 and 5-2 for details on these savings.

Over (Short) – The amount that the utility's total quantified savings for all current conservation activities (since 2012), including water loss reduction, is over or below the volume represented by reductions in GPCD each year. If the quantified savings are less than these target volumes, the value will appear in parentheses.

Table 3-2. Utility Water Conservation Plan Goals — Total GPCD.

Year #	Year	Utility Population	Total GPCD Goals	Annual Savings Goal with Reduction in GPCD (MG)	Total Savings for All Current Quantified Activities (MG)	Over (Short) (MG)
0	**Baseline**	-	122	0	0	0
1	2015	16,192	119	17	(29)	(46)
2	2016	16,274	116	33	(8)	(41)
3	2017	16,355	114	50	(8)	(58)
4	2018	16,437	111	67	(7)	(75)
5-year Goal	2019	16,518	108	84	(7)	(91)
6	2020	16,600	107	91	(7)	(98)
7	2021	16,690	106	97	(6)	(104)
8	2022	16,780	105	104	(6)	(110)
9	2023	16,870	104	111	(6)	(117)
10-year Goal	2024	16,960	103	118	(5)	(123)

[13] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for total GPCD from the utility's most recently submitted five-year water conservation plan was used.

3.3 Utility Water Conservation Plan Goals – Water Loss GPCD

Table 3-3 shows how Crystal Clear SUD’s most recent water loss audit compares with five- and 10-year water loss goals in its water conservation plan. The following definitions pair with the column headers in Table 3-2.

Utility Population – Estimated utility service area population for the years indicated.

Water Loss GPCD Goals – Water loss GPCD goals start with the utility’s baseline[14] for water loss GPCD and progress in subsequent years to match 5- and 10-year water loss goals indicated in a utility’s five-year water conservation plan on file with the TWDB. The first five annual GPCD goals were developed by spreading the difference between the baseline and five-year goal evenly over five years. The second five annual GPCD goals spread the difference between the five-year goal and 10-year goal evenly over the next five years.

Yearly Savings Goal with Reduction in GPCD (MG) – This column shows what reductions from the baseline water loss GPCD would yield in terms of volume each year as more water is saved. The volumes indicated here are what target water loss GPCD goals look like expressed in million gallons. Annual volumes were derived using the formula: (baseline water loss GPCD – target water loss GPCD for that year) x 365 days ÷ 1,000,000 gallons.

Total Savings from Water Loss Reduction (MG) – The difference between a utility’s established baseline for water loss GPCD and the most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB. If water loss GPCD has increased from the utility's baseline to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount. Reference Table 5-2 for savings from water loss reduction.

Over (Short) – The amount that the utility's total savings from water loss reduction is over or below the volume represented by reductions in GPCD each year. If water loss reduction savings are less than these target volumes, the value will appear in parentheses.

Table 3-3. Utility Water Conservation Plan Goals — Water Loss GPCD.

Year #	Year	Utility Population	Water Loss GPCD Goals	Yearly Savings Goal with Reduction in GPCD (MG)	Total Savings from Water Loss Reduction (MG)	Over (Short) (MG)
0	**Baseline**	-	22	0	0	0
1	2015	16,192	21	7	(41)	(48)
2	2016	16,274	20	14	(42)	(56)
3	2017	16,355	18	21	(42)	(63)
4	2018	16,437	17	29	(42)	(71)
5-year Goal	2019	16,518	16	36	(42)	(78)
6	2020	16,600	16	38	(42)	(80)
7	2021	16,690	16	39	(43)	(82)
8	2022	16,780	15	40	(43)	(83)
9	2023	16,870	15	42	(43)	(85)
10-year Goal	2024	16,960	15	43	(43)	(87)

[14] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.

4 Implemented Activities

Below is a list of completed activities with estimated water savings. Note that drought response and other measures are not included in the utility's water savings because they are temporary, awareness-based or not able to be accurately quantified on an annual basis.

These are not savings projections of potential future activities. Estimated savings are based on measures that have actually been implemented. If savings are shown to persist in future years, it is because the measure is permanent, such as an ordinance, or the savings are assumed to continue for the reason listed under the itemized activity. Estimated savings from water rate increases are the one exception to these conditions.

Water Rate Increases

Savings from water rate increases were included because entities such as the U.S. Environmental Protection Agency and others indicate specific savings for utilities that raise rates (Texas Water Development Board, 2013; U.S. E.P.A., 1998; Whitcomb, 1999). This project includes surveys of several utilities that have minimal education efforts, perform no other substantive conservation activities, and yet experienced significant demand reduction that coincided with rate increases. In those cases, savings estimates matched up closely with decreases in total GPCD. For many smaller utilities, especially those with customers lacking disposable income, this measure is the only tool used to conserve other than water loss reduction

The following assumptions were made for water rate increases:

- The model assumes that savings persist into future years because it is expected that the utility will continue to make periodic rate increases in line with the percentage increases from previous years.
- Only the last two rate increases for a utility were quantified.
- Savings grow with demand because as new customers enter the service area, they are assumed to adhere to the same price elasticity model estimates.
- A weighted average for savings was used when rate increases differed between residential and industrial-commercial-institutional (ICI) customers based on the individual utility's customer class breakdown.
- When a utility raised rates using tiered rate conservation pricing, a 50/50 savings split was used when increases differed between base and volumetric rates.
    - The reasoning is that all customers must react to the base increase, yet the pricing signal is stronger when volumetric rate increases affect the higher usage customers.
    - The 50/50 split is reasonable because many customers will not reach the higher volumetric tiers.
    - Studies show that most customers do not actually know they have reached the higher volumetric tiers; just that their bill has increased (Texas Water Development Board, 2013).

4.1 Itemized Activities

1. **Utility Website**
    a. Easy-to-use website with conservation tips and water rates
    b. Features contact information for Public Works staff and customer service

2. **Continuing Public Education**
    a. The utility engages the public in many ways including:
        i. Brochures, bill messages, displays, and exhibits

3. **Water Loss Reduction Savings**[15]
    a. Loss of (41) MG annually in 2015
    b. Water loss reduction savings = the difference between a utility's baseline[16] water loss GPCD submitted in its most recent 5-year water conservation plan and its most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB
    c. If water loss GPCD has increased from the utility's baseline or historic 5-year average to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount.
    d. All savings estimates grow each year at the same rate population figures for the utility grow in the regional water plan.

4. **Water Rate Increases**
    a. Last rate increases:[17]
        i. 8.0% increase in 2015
        ii. 13.56% increase in 2016
    b. Estimated customer demand reduction of 4.31%
    c. Savings is cumulative and based on more than one source[18] (U.S. EPA, 1998; Whitcomb, 1999)
    d. Savings from rate increases are shown to persist over time, however, note that savings from these pricing signals will likely decrease if rates remain the same in future years.

5. **Automatic Meter Reading (AMR)/Advanced Metering Infrastructure (AMI)**
    a. These metering systems can save water in a number of ways, including from water loss reduction through improved leak detection.
    b. All water loss reduction savings associated with this activity are detailed in Section 5, which assessed utility baseline water loss GPCD and most recently reported water loss GPCD to determine water savings.

---

[15] If current water loss levels exceed a utility's baseline, this value is treated as a deduction from total quantified savings.
[16] In the absence of having a baseline figure provided in the utility's most recently submitted 5-year water conservation plan, the historic 5-year average for water loss GPCD in the plan was used.
[17] Correspondence with utility staff.
[18] The study estimates a 2% demand reduction with 10% increase in price on a targeted customer class. By applying a ratio, it is possible to determine the savings for lower or higher percentage increases.

c. For estimated water savings that could be increased by implementing meter data management (MDM) and customer engagement portal applications, refer to Section 6 of this report.
    i. With these additional applications, water savings can be achieved through changed customer behavior and other real-time actions that go beyond water loss reduction.

5 Summary of Savings

Table 5-1. Savings by Water Conservation Activity (MG).

Year	Water Rate Increases	TOTAL SAVINGS
2012		0
2013		0
2014		0
2015	12.3	12
2016	33.6	34
2017	34.1	34
2018	34.6	35
2019	35.2	35
2020	35.7	36
2021	36.3	36
2022	36.8	37
2023	37.4	37
2024	37.9	38
2025	38.5	38
2026	39.0	39
2027	39.6	40
2028	40.1	40
2029	40.7	41
2030	41.2	41
2031	41.8	42
2032	42.5	42
2033	43.1	43
2034	43.7	44
2035	44.3	44
2036	44.9	45

2023	16,870	29.00	(43)
2024	16,960	29.00	(43)

6 Suggested Activities

Up to four activities were chosen as potential suggested activities for individual reports. These activities are: AMI system with customer portal, twice-per-week (or less) outdoor watering ordinances, strategic water rate increases, and rain barrels.

Activities were chosen because they are:

- Achievable
- Prevalence of vendors that can actually implement them
- Acceptability to city councils, MUD boards, et al.
- Easily adopted
- Cost effective
- Yield high savings relative to cost

AMI systems with customer engagement portals were also chosen because they represent a profusion of future applications that will undoubtedly continue to advance conservation efforts. AMI and meter data management (MDM) companies are developing new and innovative ways to benefit water providers, customers, and ultimately states that are pushing conservation and usage analytics further.

Each utility should be cognizant of the potential impact that these suggested activities may have on its own unique rate and revenue situation.

Benefits to consider:

- Avoided water supply and wastewater costs
  - The higher water purchase, transmission, and distribution costs are, the greater the potential benefit realized when large amounts of water are conserved with these activities.
- Avoided system expansion costs
  - Conserving water may allow a utility to postpone building new system capacity by decreasing demand even as population grows.

Costs to consider:

- Staff time and resources
- Unit cost per unit saved
- Implementation costs
- Stakeholder agreement and support
- Other overhead and budget considerations

6.1 Suggested Activities with Savings Estimates

1. Twice-a-week Outdoor Watering Restriction Ordinance
  - **a.** Potentially 6.11% savings of total demand (Hermitte and Mace, 2012; Sierra Club-Lone Star Chapter and National Wildlife Federation, 2015)
    - i. Average Region L savings
    - ii. Specific percentage of outdoor usage unknown for your utility at this time
  - **b.** Savings could be 48 MG per year with current demand.
  - **c.** See Table 6-1 for potential savings from this measure compared with the city's WMS supply volumes targets.

Table 6-1. Current Savings + Potential Savings from 2x per Week Watering Ordinance (MG).

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Potential Savings from Ordinance	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)
2016	34	(42)	(8)	48	0	0	0	40
2017	34	(42)	(8)	48	0	0	0	41
2018	35	(42)	(7)	49	0	0	0	42
2019	35	(42)	(7)	50	0	0	0	43
2020	36	(42)	(7)	51	0	0	0	44
2021	36	(43)	(6)	51	0	0	0	45
2022	37	(43)	(6)	52	0	0	0	46
2023	37	(43)	(6)	53	0	0	0	47
2024	38	(43)	(5)	54	0	0	0	48
2025	38	(44)	(5)	55	0	0	0	50
2026	39	(44)	(5)	55	0	0	0	51
2027	40	(44)	(4)	56	0	0	0	52
2028	40	(44)	(4)	57	0	0	0	53
2029	41	(44)	(4)	58	0	0	0	54
2030	41	(45)	(3)	58	0	0	0	55
2031	42	(45)	(3)	59	0	0	0	56
2032	42	(45)	(3)	60	0	0	0	57

2034	44	(46)	(2)	62	0	0	0	60
2035	44	(46)	(2)	63	0	0	0	61
2036	45	(46)	(1)	64	0	0	0	62
2037	45	(47)	(1)	64	0	0	0	63
2038	46	(47)	(1)	65	0	0	0	65
2039	47	(47)	(0)	66	0	0	0	66
2040	47	(47)	(0)	67	0	0	0	67

2. Advanced Metering Infrastructure with Customer Engagement Portal

These portals, along with mobile applications and billing statements, can provide customers with much more access to their water use data in simple and compelling formats. This access and comparison with other customers' usage can reduce water use through changed behavior, as well as provide an opportunity for other conservation programs to be offered to the customer for increased adoption and additional savings. AMI systems support leak notification and web portals with real-time data. Any water loss reduction savings that these systems also yield were included in the water loss assessment of individual reports for this project.

- **a.** Specific utility results will vary based on portal features and frequency of customer notifications
- **b.** Potential savings estimate assumes 20% of residential customers will use and save water due to the portal (Westin Engineering, 2015)
- **c.** Estimate assumes customers will save 10% of total annual use due to the portal
    - i. Savings estimate of 10% is an average of results from multiple studies (Chesnutt and Mitchell, 2013; East Bay Municipal Utility District, 2014; IBM, 2011; Texas A&M and Texas Water Resources Institute, 2016; Westin Engineering, 2015)
- **d.** Residential customers' use assumed to make up approximately 67% of all retail customers' use based on utility profile information submitted to the TWDB
    - i. This was the most common percentage of residential use among participating utilities in this project.
    - ii. Actual customer class demand percentages will vary by utility.
- **e.** 20% of residential customers saving 10% with this customer class breakdown amounts to 1.34% of total demand
- **f.** Savings are assumed to increase along with demand as connections increase each year[19]
- **g.** See Table 6-2 for potential savings from this measure compared with the utility's WMS supply volumes targets.

[19] The 10% consumption reduction figure for 20% of residential customers is conservative, but savings could be greater when monitored yearly as customer engagement increases.

Table 6-2. Current Savings + Potential Savings from AMI with Customer Portal (MG).

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Potential Savings from AMI with Customer Portal	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)
2016	34	(42)	(8)	10	0	0	0	2
2017	34	(42)	(8)	11	0	0	0	3

2025	38	(44)	(5)	12	0	0	0	7
2026	39	(44)	(5)	12	0	0	0	7
2027	40	(44)	(4)	12	0	0	0	8
2028	40	(44)	(4)	12	0	0	0	8
2029	41	(44)	(4)	13	0	0	0	9
2030	41	(45)	(3)	13	0	0	0	9
2031	42	(45)	(3)	13	0	0	0	10
2032	42	(45)	(3)	13	0	0	0	10
2033	43	(45)	(2)	13	0	0	0	11
2034	44	(46)	(2)	14	0	0	0	11
2035	44	(46)	(2)	14	0	0	0	12
2036	45	(46)	(1)	14	0	0	0	13
2037	45	(47)	(1)	14	0	0	0	13
2038	46	(47)	(1)	14	0	0	0	14
2039	47	(47)	(0)	15	0	0	0	14
2040	47	(47)	(0)	15	0	0	0	15

3. Rain Barrels
    - **a.** In Region L, utilities could save approximately 17 gallons per year per gallon of capacity rebated, sold, or distributed (GDS Associates, 2002).
    - **b.** Estimated 10-year useful life for most barrels

Statewide Water Conservation Quantification Project
City of Hondo Report • 2017

1 Introduction

In Texas' 2017 State Water Plan, municipal water conservation is projected to meet 9.6 percent[1] of the state's future water needs by 2070. According to the 16 regional water plans that comprise the state water plan, this is expected to be achieved through a variety of measures such as installation of water efficient plumbing fixtures, water conservation pricing structures, water system audits, landscape irrigation ordinances, as well as other water conservation activities. The 9.6 percent is "in addition to the estimated share of future passive conservation savings from plumbing codes and water efficiency standards, which are embedded in municipal water demand projections" (Texas Water Development Board, 2017).

In 2015, the Texas Legislature appropriated funds to the Texas Water Development Board (TWDB) to fund a research project principally charged with quantitatively determining the savings of municipal water conservation activities being implemented in relation to the recommended conservation goals (supply volumes) in the State Water Plan. As part of the project, individual reports were completed for all participating utilities.

With this report, utilities will benefit by receiving a clear and concise picture of its water conservation goals alongside estimated savings from quantifiable activities. In the event that current activity savings may not be able to reach long-term goals, this report offers suggestions on how utilities can reach water conservation goals with activities that are effective, easily adopted, have widespread appeal, and are quantifiable.

2 Municipal Conservation Terminology and Review of Methodology Used by Regional Planners

To make use of the results of this study, it is important to understand several key terms used in the water planning process.

What is a water user group?

In this report, a water user group (WUG) refers to a retail water provider in the form a city, municipal utility district, water control and improvement district, special utility district, water supply corporation, fresh water supply district, or other type of water utility. The TWDB further defines WUGs as one of the following (Texas Water Development Board, 2016b):

- Cities and towns with a population of 500 or more
- Non-city utilities providing more than 280 acre-feet per year per year of water for municipal use
- Collective reporting units (CRUs) consisting of grouped utilities having a common association

[1] Equal to 811,224 acre-feet per year in conservation savings.

- County-Wide WUGs:
    - County-Other (Rural/unincorporated areas of municipal water use)
    - Manufacturing
    - Steam electric power generation

What is a recommended water management strategy?

A recommended water management strategy (WMS) is a measure that will help ensure WUGs have adequate water supplies for their end users well into the future. WMS examples include river diversions, groundwater use, reservoir and aquifer development, and irrigation conservation. When WMS is referred to in this report, it refers only to municipal conservation, which may include water loss reduction as a part of the same strategy.

What is a WMS supply volume?

A WMS supply volume is the amount of water that a given strategy is expected to yield each decade in the planning period if carried out by the WUG. In this report, a WMS supply volume is the amount of water recommended to come from municipal water conservation.

Some regional water plans separate this strategy's supply volume into a volume for municipal water conservation and a volume for water loss reduction for each decade. The total strategy supply volume is the sum of both. A regional water plan may also refer to "advanced conservation" as part of this strategy. Advanced conservation usually indicates that the volume could be achieved through a more robust mix of conservation activities described in the plan.

2.1 Regional Planning Group Approach to Determining Supply Volumes

Each regional water planning group (RWPG) is responsible for producing its own individual plan that, if executed, will provide sufficient water to its WUGs throughout a 50-year planning period. These plans are completed in five-year cycles, with the most recent edition being completed in 2016. The 2016 regional plans make up the 2017 State Water Plan, which sets out WMS supply volumes for the years 2020 through 2070.

The decadal WMS supply volumes for municipal conservation were established by each of the RWPGs in much the same manner. The RWPGs generally followed the guidelines of the Texas Legislature's Water Conservation Implementation Task Force on the pace utilities should target to reduce gallons per capita per day (GPCD)[2] consumption levels.

The targeted reductions used by most regions follow this formula:

- For municipal WUGs with water use of 140 GPCD and greater, the goal is to reduce per capita water use by one percent per year until the level of 140 GPCD is reached,

[2] Regional water planning GPCD is defined as the annual volume of water pumped, diverted, or purchased minus the volume exported (sold) to other water systems or large industrial facilities divided by the permanent resident population of the Municipal Water User Group in the regional water planning process divided by 365. Saline and reused/recycled water are not included in this volume (Texas Water Development Board, 2012).

after which, the goal is to reduce per capita water use by one-fourth percent per year for the remainder of the planning period (Texas Water Development Board, 2016j).

The yearly reductions in GPCD for a given WUG are then converted into recommended supply volumes in acre-feet per year for each decade as the reductions in consumption continue. Some regions reduce GPCD by slightly different percentages before and after the 140 GPCD threshold, some do not apply further reductions in GPCD for WUGs once they reach 140 GPCD, while others recommend only "advanced conservation" activities once WUGs meet 140 GPCD.

2.2 Methodology

In order to complete a uniform quantification process, the first engagement was with utilities that agreed to participate and collected as much relevant data as possible. These data included, among many others, historical GPCD consumption figures, advanced metering infrastructure (AMI) specifications, and detailed feedback on each conservation activity being implemented. Personal interviews focused on determining when and to what extent these activities were being employed, as well as assessing plans to continue such conservation. Examples of frequently implemented activities include tiered water rate conservation pricing, strategic water rate increases, outdoor irrigation audits and ordinances, and rain barrel distribution.

Subsequently, each utility's conservation activities were quantified through several different means, including evidence-based studies, utility field results and savings determinations, manufacturer guarantees, water loss audits, TWDB studies, and other information that assigned a savings value to the activity's implementation.

Every conservation activity studied and quantified has a gallons-per-year estimate, useful life, and decay rate (if applicable) associated with it. Some activities' savings are projected to grow as demand grows over time, while some savings are constant each year and subside once useful life has run its course. For expanded methodology and details on studies and formulas used to determine activity savings, refer to Section 6 of the State Report included as part of this document.

Once analyzed, the resulting savings estimates from each utility were compared with the recommended WMS supply volumes in its respective regional plan to determine if the savings met, exceeded, or fell short of those volumes. Individual utility savings were aggregated to compare with regional volumes, and regional savings were aggregated to compare with state volumes.

It is important to note that this report quantified activity savings—not including water loss reduction—for the WMS supply volume comparison dating back to 2012. The reason for this is, with a few exceptions, the regional planners used 2011 as the base year for establishing potential WMS supply volumes.[3] In addition, any conservation savings achieved through 2011 are assumed to be accounted for in the regional water planning GPCD for that year.[4] Thus, quantifying from 2012 and forward is the most accurate way to determine if utilities are meeting

[3] Confirmed via personal communication with Region C, H, K, and L Plan consultants.
[4] It was established with TWDB planning staff that 2011 GPCD levels were chosen because they represented the most current water use and conservation patterns at the time.

the recommended conservation volumes in the regional plans. This assumption is by no means 100 percent accurate, however. Some previously implemented activities' savings persist into future years beyond this starting point, while some activities' savings have ceased. One year's GPCD will not necessarily include all savings yielded by conservation activities that came before it, but the quantification assessment must have a starting point.

2.3 Quantifiable Savings

The key to the project being useful and reliable is that the results from year to year are measurable. Quantifying conservation activities that can be accurately measured provides greater certainty and better planning for all stakeholders.

While many utilities are engaged in a variety of conservation activities, not all can currently be properly measured. Some examples of these activities include education initiatives, website and social media engagement, and enforcement for water waste. That does not mean these measures are not essential. Education of consumers, for example, is a fundamental activity that makes all others effective, but little hard data exists to quantify the results of education alone.

In addition, the work of conservation coordinators can have a particularly significant effect on the savings of all other activities, but the specific savings attributed to that staff role is difficult to quantify.

3 Results

This report compares Hondo's current water conservation activities and their quantified savings to two metrics: 1) Region L Water Plan's (Texas Water Development Board, 2016j) recommended WMS supply volumes for municipal conservation, and 2) Hondo's own 5- and 10-year goals as established in its most recent water conservation plan submitted to the TWDB.

The WMS supply volumes for municipal water conservation are laid out by decade (2020 – 2070) in the regional water plans to serve as benchmarks for what each utility could achieve via that strategy during a 50-year planning period.[5]

The 5- and 10-year goals in Hondo's most recent water conservation plan are established by the utility as realistic targets for reducing consumption over that timeframe. These reductions[6] are expressed in decreasing total GPCD[7] consumption and water loss GPCD.[8] [9]

The estimated savings in Tables 3-1 through 3-3 indicate the best information available as

---

[5] Some regional water plans separate this strategy volume into a volume for water conservation and a volume for water loss reduction for each decade. The total strategy volume is the sum of both.

[6] Occasionally, some utilities expect consumption to increase due to various reasons, such as an incoming industrial presence expected to raise consumption figures for the entire service area.

[7] As defined in TWDB water conservation plan annual report (Texas Water Development Board, 2016o): (Total Gallons in System ÷ Permanent Population) ÷ 365

[8] These plans also have targets for residential GPCD and water loss as a percentage (rather than GPCD), but this report does not address those goals.

[9] As defined in TWDB water conservation plan annual report (Texas Water Development Board, 2016o): (Total Water Loss ÷ Permanent Population) ÷ 365

provided by utility staff. Some ongoing activities may not be known and are within a utility's service area are implemented on a micro-scale that may not be quantified. Individual households and businesses may be implementing conservation measures that are unknown and therefore cannot be included in the report.

Explanation of approach to assessing water loss reduction savings

Water loss reduction savings are defined as the volume of water participating utilities are realizing from their water loss mitigation efforts. For this report, this value is the difference between each individual utility's baseline[10] for water loss GPCD and its most recent water loss GPCD reported in 2015 water loss audits on file with TWDB. Savings from all water loss reduction efforts—including pipe replacements and leak repair—are assumed to be included in this comparison to a utility's baseline.

Note that because a single year (2015) value was used for comparison, it is possible that the 2015 value could be anomalous due to a number of events that may have occurred that year, such as a water main break, a particularly wet year, or a robust effort by the utility to curtail water loss. This will distort future savings figures that were carried forward in the study because water loss will inevitably increase or decrease in later years.

Ideally, using a rolling five-year average in the calculation would correct such anomalies. However, there was insufficient data to do that for every utility. The approach was to use the most complete water loss data possible, which was represented by the 2015 water loss audit. This problem will be further minimized, as continued data collection will allow five-year averages to be calculated for a majority of utilities.

In this way, water loss savings estimates are different from all other activity savings estimates in the project. Whether savings were positive or negative depended on where individual utilities established their own baselines or where their five-year average started, and what water loss GPCD value was reported in 2015.

3.1 Current Savings Compared to Conservation WMS Supply Volume (in million gallons) in Regional Water Plan

Table 3-1 shows the 2070 outlook for Hondo with the utility's yearly recommended WMS supply volume in million gallons (MG) alongside its water savings from implemented activities, including from water loss reduction. These activities and their associated savings are covered in greater detail in Sections 4 and 5.

Starting in 2015, this table compares all quantified conservation activity and the recommended conservation WMS supply volume for the planning period. The following definitions pair with the column headers in Table 3-1.

<u>Actual Current Conservation Activity Savings</u> – All quantified activities currently being performed by the utility, *excluding* savings from water loss reduction. The regional planners used

[10] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.

2011 GPCD as the baseline for determining future conservation WMS supply volumes, therefore the study quantifies utility savings starting in 2012 for this comparison. The summary of these savings can be referenced in Table 5-1.

Actual Water Loss Reduction Savings (as of 2015) – The difference between the baseline[11] for water loss GPCD and most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB. [12] The summary of these savings can be referenced in Table 5-2.

Total Savings from All Conservation Activity – Actual Current Conservation Activity Savings plus Actual Water Loss Reduction Savings (as of 2015).

Conservation WMS Volume – The recommended municipal water conservation supply volume in the regional plan for the decades ranging from 2020 to 2070. These volumes are converted to MG from the values listed in the plan in acre-feet and then calculated in annual increments.

Water Loss Reduction WMS Volume – Some regional water plans have a separate WMS volume for water conservation and for water loss reduction for each decade. If a WUG's regional plan has a WMS volume for water loss reduction, this column will have values other than zero.

Total Yearly WMS Volume – The sum of the Conservation WMS Volume and Water Loss Reduction WMS Volume.

Over (Short) – The amount that the utility's Total Savings from All Conservation Activity (since 2012), is over or below the Total Yearly WMS Volume in the regional water plan. If the amount falls below the WMS volume, it will appear in parentheses.

[11] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.
[12] If water loss GPCD has increased from the utility's baseline or historic five-year average to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount.

Table 3-1. Current Savings Compared to Conservation WMS Supply Volume (MG) in Regional Water Plan.

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)
2015	120	(57)	63	13	0	13	51

2066	210	(82)	129	233	0	233	(105)
2067	211	(82)	129	236	0	236	(107)
2068	212	(82)	130	238	0	238	(109)
2069	213	(83)	130	241	0	241	(111)
2070	214	(83)	131	243	0	243	(113)

3.2 Utility Water Conservation Plan Goals – Total GPCD

Table 3-2 shows how Hondo's quantified savings from its implemented activities compare with five- and goals established in its individual water conservation plan submitted to the TWDB. The following definitions pair with the column headers in Table 3-2.

Utility Population – Estimated utility service area population for the years indicated.

Total GPCD Goals – Total GPCD goals start with the utility's baseline[13] for total GPCD and progress in subsequent years to match 5- and 10-year goals indicated in a utility's five-year water conservation plan on file with the TWDB. The first five annual GPCD goals were developed by spreading the difference between the baseline and five-year goal evenly over five years. The second five annual GPCD goals spread the difference between the five-year goal and 10-year goal evenly over the next five years.

Annual Savings Goal with Reduction in GPCD (MG) – This column shows what reductions from the baseline GPCD would yield in terms of volume each year as more water is saved. The volumes indicated here are what target GPCD goals look like expressed in million gallons. Annual volumes were derived using the formula: (baseline total GPCD – target total GPCD for that year) x 365 days ÷ 1,000,000 gallons.

Total Savings for All Current Quantified Activities (MG) – Total quantified savings for all current conservation activities and savings from water loss reduction. Refer to Tables 5-1 and 5-2 for details on these savings.

Over (Short) – The amount that the utility's total quantified savings for all current conservation activities (since 2012), including water loss reduction, is over or below the volume represented by reductions in GPCD each year. If the quantified savings are less than these target volumes, the value will appear in parentheses.

Table 3-2. Utility Water Conservation Plan Goals — Total GPCD.

Year #	Year	Utility Population	Total GPCD Goals	Annual Savings Goal with Reduction in GPCD (MG)	Total Savings for All Current Quantified Activities (MG)	Over (Short) (MG)
0	**Baseline**	-	176	0	0	0
1	2014	9,061	176	1	0	(1)
2	2015	9,119	175	3	63	60
3	2016	9,236	175	4	100	96
4	2017	9,352	174	5	100	95
5-year Goal	2018	9,469	174	7	101	94
6	2019	9,585	174	8	101	94
7	2020	9,702	174	8	102	93
8	2021	9,797	173	9	102	93
9	2022	9,892	173	10	103	93
10-year Goal	2023	9,988	173	11	104	93

13 In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for total GPCD from the utility's most recently submitted five-year water conservation plan was used.

3.3 Utility Water Conservation Plan Goals – Water Loss GPCD

Table 3-3 shows how Hondo's most recent water loss audit compares with five- and 10-year water loss goals in its water conservation plan. The following definitions pair with the column headers in Table 3-2.

Utility Population – Estimated utility service area population for the years indicated.

Water Loss GPCD Goals – Water loss GPCD goals start with the utility's baseline[14] for water loss GPCD and progress in subsequent years to match 5- and 10-year water loss goals indicated in a utility's five-year water conservation plan on file with the TWDB. The first five annual GPCD goals were developed by spreading the difference between the baseline and five-year goal evenly over five years. The second five annual GPCD goals spread the difference between the five-year goal and 10-year goal evenly over the next five years.

Yearly Savings Goal with Reduction in GPCD (MG) – This column shows what reductions from the baseline water loss GPCD would yield in terms of volume each year as more water is saved. The volumes indicated here are what target water loss GPCD goals look like expressed in million gallons. Annual volumes were derived using the formula: (baseline water loss GPCD – target water loss GPCD for that year) x 365 days ÷ 1,000,000 gallons.

Total Savings from Water Loss Reduction (MG) – The difference between a utility's established baseline for water loss GPCD and the most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB. If water loss GPCD has increased from the utility's baseline to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount. Reference Table 5-2 for savings from water loss reduction.

Over (Short) – The amount that the utility's total savings from water loss reduction is over or below the volume represented by reductions in GPCD each year. If water loss reduction savings are less than these target volumes, the value will appear in parentheses.

Table 3-3. Utility Water Conservation Plan Goals — Water Loss GPCD.

Year #	Year	Utility Population	Water Loss GPCD Goals	Yearly Savings Goal with Reduction in GPCD (MG)	Total Savings from Water Loss Reduction (MG)	Over (Short) (MG)
0	**Baseline**	-	27.00	0	0	0
1	2014	9,061	26.80	1	(56)	(57)
2	2015	9,119	26.60	1	(57)	(58)
3	2016	9,236	26.40	2	(57)	(59)
4	2017	9,352	26.20	3	(58)	(61)
5-year Goal	2018	9,469	26.00	3	(59)	(62)
6	2019	9,585	25.80	4	(59)	(64)
7	2020	9,702	25.60	5	(60)	(65)
8	2021	9,797	25.40	6	(61)	(67)
9	2022	9,892	25.20	6	(61)	(68)
10-year Goal	2023	9,988	25.00	7	(62)	(69)

[14] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.

4 Implemented Activities

Below is a list of completed activities with estimated water savings. Note that drought response and other measures are not included in the utility's water savings because they are temporary, awareness-based or not able to be accurately quantified on an annual basis.

These are not savings projections of potential future activities. Estimated savings are based on measures that have actually been implemented. If savings are shown to persist in future years, it is because the measure is permanent, such as an ordinance, or the savings are assumed to continue for the reason listed under the itemized activity. Estimated savings from water rate increases are the one exception to these conditions.

Water Rate Increases

Savings from water rate increases were included because entities such as the U.S. Environmental Protection Agency and others indicate specific savings for utilities that raise rates (Texas Water Development Board, 2013; U.S. E.P.A., 1998; Whitcomb, 1999). This project includes surveys of several utilities that have minimal education efforts, perform no other substantive conservation activities, and yet experienced significant demand reduction that coincided with rate increases. In those cases, savings estimates matched up closely with decreases in total GPCD. For many smaller utilities, especially those with customers lacking disposable income, this measure is the only tool used to conserve other than water loss reduction.

The following assumptions were made for water rate increases:

- The model assumes that savings persist into future years because it is expected that the utility will continue to make periodic rate increases in line with the percentage increases from previous years.
- Only the last two rate increases for a utility were quantified.
- Savings grow with demand because as new customers enter the service area, they are assumed to adhere to the same price elasticity model estimates.
- A weighted average for savings was used when rate increases differed between residential and industrial-commercial-institutional (ICI) customers based on the individual utility's customer class breakdown.
- When a utility raised rates using tiered rate conservation pricing, a 50/50 savings split was used when increases differed between base and volumetric rates
    - The reasoning is that all customers must react to the base increase, yet the pricing signal is stronger when volumetric rate increases affect the higher usage customers.
    - The 50/50 split is reasonable because many customers will not reach the higher volumetric tiers.
    - Studies show that most customers do not actually know they have reached the higher volumetric tiers; just that their bill has increased (Texas Water Development Board, 2013).

4.1 Itemized Activities

1. **Utility Website**
    a. Easy-to-use website with conservation tips and water rates
    b. Features contact information for Public Works staff and customer service

2. **Continuing Public Education**
    a. The utility engages the public in many ways including:
        i. Brochures, bill messages, displays, and exhibits

3. **Water Loss Reduction Savings**[15]
    a. Loss of 57 MG annually in 2015
    b. Water loss reduction savings = the difference between a utility's baseline[16] water loss GPCD submitted in its most recent 5-year water conservation plan and its most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB
    c. If water loss GPCD has increased from the utility's baseline or historic 5-year average to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount.
    d. All savings estimates grow each year at the same rate population figures for the utility grow in the regional water plan.

4. **Water Rate Increases**
    a. Last rate increases:[17]
        i. 100% increase in residential and 25.67% increase for commercial in 2015
        ii. 30% increase in residential and 20% increase for commercial in 2016
    b. Estimated customer demand reduction of 24.2%
    c. Savings is cumulative and based on more than one source[18] (U.S. EPA, 1998; Whitcomb, 1999)
    d. Savings from rate increases are shown to persist over time, however, note that savings from these pricing signals will likely decrease if rates remain the same in future years.

5. **Automatic Meter Reading (AMR)/Advanced Metering Infrastructure (AMI)**
    a. These metering systems can save water in a number of ways, including from water loss reduction through improved leak detection.
    b. All water loss reduction savings associated with this activity are detailed in Section 5, which assessed utility baseline water loss GPCD and most recently reported water loss GPCD to determine water savings.

---

[15] If current water loss levels exceed a utility's baseline, this value is treated as a deduction from total quantified savings.
[16] In the absence of having a baseline figure provided in the utility's most recently submitted 5-year water conservation plan, the historic 5-year average for water loss GPCD in the plan was used.
[17] Correspondence with utility staff.
[18] The study estimates a 2% demand reduction with 10% increase in price on a targeted customer class. By applying a ratio, it is possible to determine the savings for lower or higher percentage increases

c. For estimated water savings that could be increased by implementing meter data management (MDM) and customer engagement portal applications, refer to Section 6 of this report.
    i. With these additional applications, water savings can be achieved through changed customer behavior and other real-time actions that go beyond water loss reduction.

5 Summary of Savings

Table 5-1. Savings by Water Conservation Activity (MG).

Year	Water Rate Increases	TOTAL SAVINGS
2012		0
2013		0
2014		0
2015	119.7	120
2016	157.0	157
2017	158.2	158
2018	159.4	159
2019	160.7	161
2020	161.9	162
2021	163.2	163
2022	164.4	164
2023	165.6	166
2024	166.9	167
2025	168.1	168
2026	169.3	169
2027	170.6	171
2028	171.8	172
2029	173.1	173
2030	174.3	174
2031	175.4	175
2032	176.4	176
2033	177.5	178
2034	178.6	179
2035	179.7	180
2036	180.7	181
2037	181.8	182
2038	182.9	183

2065	209.3	209
2066	210.2	210
2067	211.1	211
2068	212.0	212
2069	212.8	213
2070	213.7	214

Table 5-2. Savings from Water Loss Reduction (MG).

Year	Utility Population	Water Loss GPCD	Total Savings from Water Loss Reduction
Baseline	-	27.00	0
2015	9,119	44.00	(57)
2016	9,236	44.00	(57)
2017	9,352	44.00	(58)
2018	9,469	44.00	(59)
2019	9,585	44.00	(59)
2020	9,702	44.00	(60)
2021	9,797	44.00	(61)
2022	9,892	44.00	(61)
2023	9,988	44.00	(62)
2024	10,083	44.00	(63)

6 Suggested Activities

Up to four activities were chosen as potential suggested activities for individual reports. These activities are: AMI system with customer portal, twice-per-week (or less) outdoor watering ordinances, strategic water rate increases, and rain barrels.

Activities were chosen because they are:

- Achievable
- Prevalence of vendors that can actually implement them
- Acceptability to city councils, MUD boards, et al.
- Easily adopted
- Cost effective
- Yield high savings relative to cost

AMI systems with customer engagement portals were also chosen because they represent a profusion of future applications that will undoubtedly continue to advance conservation efforts. AMI and meter data management (MDM) companies are developing new and innovative ways to benefit water providers, customers, and ultimately states that are pushing conservation and usage analytics further.

Each utility should be cognizant of the potential impact that these suggested activities may have on its own unique rate and revenue situation.

Benefits to consider:

- Avoided water supply and wastewater costs
    - The higher water purchase, transmission, and distribution costs are, the greater the potential benefit realized when large amounts of water are conserved with these activities.
- Avoided system expansion costs

- Conserving water may allow a utility to postpone building new system capacity by decreasing demand even as population grows.

Costs to consider:

- Staff time and resources
- Unit cost per unit saved
- Implementation costs
- Stakeholder agreement and support
- Other overhead and budget considerations

6.1 Suggested Activities with Savings Estimates

1. Twice-a-week Outdoor Watering Restriction Ordinance
    a. Potentially 6.11% savings of total demand (Hermitte and Mace, 2012; Sierra Club-Lone Star Chapter and National Wildlife Federation, 2015)
        i. Average Region L savings
        ii. Specific percentage of outdoor usage unknown for your utility at this time
    b. Savings could be 40 MG per year with current demand.
    c. See Table 6-1 for potential savings from this measure compared with the city's WMS supply volumes targets.

Table 6-1. Current Savings + Potential Savings from 2x per Week Watering Ordinance (MG).

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Potential Savings from Ordinance	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)
2016	157	(57)	100	40	16	0	16	124

2. Advanced Metering Infrastructure with Customer Engagement Portal

These portals, along with mobile applications and billing statements, can provide customers with much more access to their water use data in simple and compelling formats. This access and comparison with other customers' usage can reduce water use through changed behavior, as well as provide an opportunity for other conservation programs to be offered to the customer for increased adoption and additional savings. AMI systems support leak notification and web portals with real-time data. Any water loss reduction savings that these systems also yield were included in the water loss assessment of individual reports for this project.

- **a.** Specific utility results will vary based on portal features and frequency of customer notifications
- **b.** Potential savings estimate assumes 20% of residential customers will use and save water due to the portal (Westin Engineering, 2015)
- **c.** Estimate assumes customers will save 10% of total annual use due to the portal
    - i. Savings estimate of 10% is an average of results from multiple studies (Chesnutt and Mitchell, 2013; East Bay Municipal Utility District, 2014; IBM, 2011; Texas A&M and Texas Water Resources Institute, 2016; Westin Engineering, 2015)
- **d.** Residential customers' use assumed to make up approximately 67% of all retail customers' use based on utility profile information submitted to the TWDB
    - i. This was the most common percentage of residential use among participating utilities in this project.
    - ii. Actual customer class demand percentages will vary by utility.
- **e.** 20% of residential customers saving 10% with this customer class breakdown amounts to 1.34% of total demand
- **f.** Savings are assumed to increase along with demand as connections increase each year[19]
- **g.** See Table 6-2 for potential savings from this measure compared with the utility's WMS supply volumes targets.

[19] The 10% consumption reduction figure for 20% of residential customers is conservative, but savings could be greater when monitored yearly as customer engagement increases.

Table 6-2. Current Savings + Potential Savings from AMI with Customer Portal (MG).

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Potential Savings from AMI with Customer Portal	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)
2016	157	(57)	100	1	16	0	16	85
2017	158	(58)	100	1	16	0	16	85

3. Rain Barrels

a. In Region L, utilities could save approximately 17 gallons per year per gallon of capacity rebated, sold, or distributed (GDS Associates, 2002).

b. Estimated 10-year useful life for most barrels

Statewide Water Conservation Quantification Project
City of New Braunfels Report • 2017

1 Introduction

In Texas' 2017 State Water Plan, municipal water conservation is projected to meet 9.6 percent[1] of the state's future water needs by 2070. According to the 16 regional water plans that comprise the state water plan, this is expected to be achieved through a variety of measures such as installation of water efficient plumbing fixtures, water conservation pricing structures, water system audits, landscape irrigation ordinances, as well as other water conservation activities. The 9.6 percent is "in addition to the estimated share of future passive conservation savings from plumbing codes and water efficiency standards, which are embedded in municipal water demand projections" (Texas Water Development Board, 2017).

In 2015, the Texas Legislature appropriated funds to the Texas Water Development Board (TWDB) to fund a research project principally charged with quantitatively determining the savings of municipal water conservation activities being implemented in relation to the recommended conservation goals (supply volumes) in the State Water Plan. As part of the project, individual reports were completed for all participating utilities.

With this report, utilities will benefit by receiving a clear and concise picture of its water conservation goals alongside estimated savings from quantifiable activities. In the event that current activity savings may not be able to reach long-term goals, this report offers suggestions on how utilities can reach water conservation goals with activities that are effective, easily adopted, have widespread appeal, and are quantifiable.

2 Municipal Conservation Terminology and Review of Methodology Used by Regional Planners

To make use of the results of this study, it is important to understand several key terms used in the water planning process.

What is a water user group?

In this report, a water user group (WUG) refers to a retail water provider in the form a city, municipal utility district, water control and improvement district, special utility district, water supply corporation, fresh water supply district, or other type of water utility. The TWDB further defines WUGs as one of the following (Texas Water Development Board, 2016b):

- Cities and towns with a population of 500 or more
- Non-city utilities providing more than 280 acre-feet per year per year of water for municipal use
- Collective reporting units (CRUs) consisting of grouped utilities having a common association

[1] Equal to 811,224 acre-feet per year in conservation savings.

- County-Wide WUGs:
    - County-Other (Rural/unincorporated areas of municipal water use)
    - Manufacturing
    - Steam electric power generation

What is a recommended water management strategy?

A recommended water management strategy (WMS) is a measure that will help ensure WUGs have adequate water supplies for their end users well into the future. WMS examples include river diversions, groundwater use, reservoir and aquifer development, and irrigation conservation. When WMS is referred to in this report, it refers only to municipal conservation, which may include water loss reduction as a part of the same strategy.

What is a WMS supply volume?

A WMS supply volume is the amount of water that a given strategy is expected to yield each decade in the planning period if carried out by the WUG. In this report, a WMS supply volume is the amount of water recommended to come from municipal water conservation.

Some regional water plans separate this strategy's supply volume into a volume for municipal water conservation and a volume for water loss reduction for each decade. The total strategy supply volume is the sum of both. A regional water plan may also refer to "advanced conservation" as part of this strategy. Advanced conservation usually indicates that the volume could be achieved through a more robust mix of conservation activities described in the plan.

2.1 Regional Planning Group Approach to Determining Supply Volumes

Each regional water planning group (RWPG) is responsible for producing its own individual plan that, if executed, will provide sufficient water to its WUGs throughout a 50-year planning period. These plans are completed in five-year cycles, with the most recent edition being completed in 2016. The 2016 regional plans make up the 2017 State Water Plan, which sets out WMS supply volumes for the years 2020 through 2070.

The decadal WMS supply volumes for municipal conservation were established by each of the RWPGs in much the same manner. The RWPGs generally followed the guidelines of the Texas Legislature's Water Conservation Implementation Task Force on the pace utilities should target to reduce gallons per capita per day (GPCD)[2] consumption levels.

The targeted reductions used by most regions follow this formula:

- For municipal WUGs with water use of 140 GPCD and greater, the goal is to reduce per capita water use by one percent per year until the level of 140 GPCD is reached,

[2] Regional water planning GPCD is defined as the annual volume of water pumped, diverted, or purchased minus the volume exported (sold) to other water systems or large industrial facilities divided by the permanent resident population of the Municipal Water User Group in the regional water planning process divided by 365. Saline and reused/recycled water are not included in this volume (Texas Water Development Board, 2012).

after which, the goal is to reduce per capita water use by one-fourth percent per year for the remainder of the planning period (Texas Water Development Board, 2016j).

The yearly reductions in GPCD for a given WUG are then converted into recommended supply volumes in acre-feet per year for each decade as the reductions in consumption continue. Some regions reduce GPCD by slightly different percentages before and after the 140 GPCD threshold, some do not apply further reductions in GPCD for WUGs once they reach 140 GPCD, while others recommend only "advanced conservation" activities once WUGs meet 140 GPCD.

2.2 Methodology

In order to complete a uniform quantification process, the first engagement was with utilities that agreed to participate and collected as much relevant data as possible. These data included, among many others, historical GPCD consumption figures, advanced metering infrastructure (AMI) specifications, and detailed feedback on each conservation activity being implemented. Personal interviews focused on determining when and to what extent these activities were being employed, as well as assessing plans to continue such conservation. Examples of frequently implemented activities include tiered water rate conservation pricing, strategic water rate increases, outdoor irrigation audits and ordinances, and rain barrel distribution.

Subsequently, each utility's conservation activities were quantified through several different means, including evidence-based studies, utility field results and savings determinations, manufacturer guarantees, water loss audits, TWDB studies, and other information that assigned a savings value to the activity's implementation.

Every conservation activity studied and quantified has a gallons-per-year estimate, useful life, and decay rate (if applicable) associated with it. Some activities' savings are projected to grow as demand grows over time, while some savings are constant each year and subside once useful life has run its course. For expanded methodology and details on studies and formulas used to determine activity savings, refer to Section 6 of the State Report included as part of this document.

Once analyzed, the resulting savings estimates from each utility were compared with the recommended WMS supply volumes in its respective regional plan to determine if the savings met, exceeded, or fell short of those volumes. Individual utility savings were aggregated to compare with regional volumes, and regional savings were aggregated to compare with state volumes.

It is important to note that this report quantified activity savings—not including water loss reduction—for the WMS supply volume comparison dating back to 2012. The reason for this is, with a few exceptions, the regional planners used 2011 as the base year for establishing potential WMS supply volumes.[3] In addition, any conservation savings achieved through 2011 are assumed to be accounted for in the regional water planning GPCD for that year.[4] Thus, quantifying from 2012 and forward is the most accurate way to determine if utilities are meeting

[3] Confirmed via personal communication with Region C, H, K, and L Plan consultants.
[4] It was established with TWDB planning staff that 2011 GPCD levels were chosen because they represented the most current water use and conservation patterns at the time.

the recommended conservation volumes in the regional plans. This assumption is by no means 100 percent accurate, however. Some previously implemented activities' savings persist into future years beyond this starting point, while some activities' savings have ceased. One year's GPCD will not necessarily include all savings yielded by conservation activities that came before it, but the quantification assessment must have a starting point.

2.3 Quantifiable Savings

The key to the project being useful and reliable is that the results from year to year are measurable. Quantifying conservation activities that can be accurately measured provides greater certainty and better planning for all stakeholders.

While many utilities are engaged in a variety of conservation activities, not all can currently be properly measured. Some examples of these activities include education initiatives, website and social media engagement, and enforcement for water waste. That does not mean these measures are not essential. Education of consumers, for example, is a fundamental activity that makes all others effective, but little hard data exists to quantify the results of education alone.

In addition, the work of conservation coordinators can have a particularly significant effect on the savings of all other activities, but the specific savings attributed to that staff role is difficult to quantify.

3 Results

This report compares New Braunfels' current water conservation activities and their quantified savings to two metrics: 1) Region L Water Plan's (Texas Water Development Board, 2016j) recommended WMS supply volumes for municipal conservation, and 2) New Braunfels' own 5- and 10-year goals as established in its most recent water conservation plan submitted to the TWDB.

The WMS supply volumes for municipal water conservation are laid out by decade (2020 – 2070) in the regional water plans to serve as benchmarks for what each utility could achieve via that strategy during a 50-year planning period.[5]

The 5- and 10-year goals in New Braunfels' most recent water conservation plan are established by the utility as realistic targets for reducing consumption over that timeframe. These reductions[6] are expressed in decreasing total GPCD [7] consumption and water loss GPCD.[8] [9]

---

[5] Some regional water plans separate this strategy volume into a volume for water conservation and a volume for water loss reduction for each decade. The total strategy volume is the sum of both.

[6] Occasionally, some utilities expect consumption to increase due to various reasons, such as an incoming industrial presence expected to raise consumption figures for the entire service area.

[7] As defined in TWDB water conservation plan annual report (Texas Water Development Board, 2016o): (Total Gallons in System ÷ Permanent Population) ÷ 365

[8] These plans also have targets for residential GPCD and water loss as a percentage (rather than GPCD), but this report does not address those goals.

[9] As defined in TWDB water conservation plan annual report (Texas Water Development Board, 2016o): (Total Water Loss ÷ Permanent Population) ÷ 365

The estimated savings in Tables 3-1 through 3-3 indicate the best information available as provided by utility staff. Some ongoing activities may not be known and are within a utility's service area are implemented on a micro-scale that may not be quantified. Individual households and businesses may be implementing conservation measures that are unknown and therefore cannot be included in the report..

Explanation of approach to assessing water loss reduction savings

Water loss reduction savings are defined as the volume of water participating utilities are realizing from their water loss mitigation efforts. For this report, this value is the difference between each individual utility's baseline[10] for water loss GPCD and its most recent water loss GPCD reported in 2015 water loss audits on file with TWDB. Savings from all water loss reduction efforts—including pipe replacements and leak repair—are assumed to be included in this comparison to a utility's baseline.

Note that because a single year (2015) value was used for comparison, it is possible that the 2015 value could be anomalous due to a number of events that may have occurred that year, such as a water main break, a particularly wet year, or a robust effort by the utility to curtail water loss. This will distort future savings figures that were carried forward in the study because water loss will inevitably increase or decrease in later years.

Ideally, using a rolling five-year average in the calculation would correct such anomalies. However, there was insufficient data to do that for every utility. The approach was to use the most complete water loss data possible, which was represented by the 2015 water loss audit. This problem will be further minimized, as continued data collection will allow five-year averages to be calculated for a majority of utilities

In this way, water loss savings estimates are different from all other activity savings estimates in the project. Whether savings were positive or negative depended on where individual utilities established their own baselines or where their five-year average started, and what water loss GPCD value was reported in 2015.

3.1 Current Savings Compared to Conservation WMS Supply Volume (in million gallons) in Regional Water Plan

Table 3-1 shows a 2070 outlook for New Braunfels with the utility's yearly recommended WMS supply volume in million gallons (MG) alongside its water savings from implemented activities, including from water loss reduction. These activities and their associated savings are covered in greater detail in Sections 4 and 5.

Starting in 2015, this table compares all quantified conservation activity and the recommended conservation WMS supply volume for the planning period. The following definitions pair with the column headers in Table 3-1.

<ins>Actual Current Conservation Activity Savings</ins> – All quantified activities currently being

[10] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.

performed by the utility, *excluding* savings from water loss reduction. The regional planners used 2011 GPCD as the baseline for determining future conservation WMS supply volumes, therefore the study quantifies utility savings starting in 2012 for this comparison. The summary of these savings can be referenced in Table 5-1.

Actual Water Loss Reduction Savings (as of 2015) – The difference between the baseline[11] for water loss GPCD and most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB. [12] The summary of these savings can be referenced in Table 5-2.

Total Savings from All Conservation Activity – Actual Current Conservation Activity Savings plus Actual Water Loss Reduction Savings (as of 2015).

Conservation WMS Volume – The recommended municipal water conservation supply volume in the regional plan for the decades ranging from 2020 to 2070. These volumes are converted to MG from the values listed in the plan in acre-feet and then calculated in annual increments.

Water Loss Reduction WMS Volume – Some regional water plans have a separate WMS volume for water conservation and for water loss reduction for each decade. If a WUG's regional plan has a WMS volume for water loss reduction, this column will have values other than zero.

Total Yearly WMS Volume – The sum of the Conservation WMS Volume and Water Loss Reduction WMS Volume.

Over (Short) – The amount that the utility's Total Savings from All Conservation Activity (since 2012), is over or below the Total Yearly WMS Volume in the regional water plan. If the amount falls below the WMS volume, it will appear in parentheses.

[11] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.
[12] If water loss GPCD has increased from the utility's baseline or historic five-year average to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount.

Table 3-1. Current Savings Compared to Conservation WMS Supply Volume (MG) in Regional Water Plan.

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)

2068	116	0	116	2,628	0	2,628	(2,512)
2069	117	0	117	2,674	0	2,674	(2,557)
2070	118	0	118	2,720	0	2,720	(2,602)

3.2 Utility Water Conservation Plan Goals – Total GPCD

Table 3-2 shows how New Braunfels quantified savings from its implemented activities compare with 5- and 10-year goals established in its individual water conservation plan submitted to the TWDB. The following definitions pair with the column headers in Table 3-2.

Utility Population – Estimated utility service area population for the years indicated.

Total GPCD Goals – Total GPCD goals start with the utility's baseline[13] for total GPCD and progress in subsequent years to match 5- and 10-year goals indicated in a utility's five-year water conservation plan on file with the TWDB. The first five annual GPCD goals were developed by spreading the difference between the baseline and five-year goal evenly over five years. The second five annual GPCD goals spread the difference between the five-year goal and 10-year goal evenly over the next five years

Annual Savings Goal with Reduction in GPCD (MG) – This column shows what reductions from the baseline GPCD would yield in terms of volume each year as more water is saved. The volumes indicated here are what target GPCD goals look like expressed in million gallons. Annual volumes were derived using the formula: (baseline total GPCD – target total GPCD for that year) x 365 days ÷ 1,000,000 gallons.

Total Savings for All Current Quantified Activities (MG) – Total quantified savings for all current conservation activities and savings from water loss reduction. Refer to Tables 5-1 and 5-2 for details on these savings.

Over (Short) – The amount that the utility's total quantified savings for all current conservation activities (since 2012), including water loss reduction, is over or below the volume represented by reductions in GPCD each year. If the quantified savings are less than these target volumes, the value will appear in parentheses.

Table 3-2. Utility Water Conservation Plan Goals — Total GPCD.

Year #	Year	Utility Population	Total GPCD Goals	Annual Savings Goal with Reduction in GPCD (MG)	Total Savings for All Current Quantified Activities (MG)	Over (Short) (MG)
0	**Baseline**	-	168	0	0	0
1	2015	70,543	165	88	17	(70)
2	2016	71,031	161	176	40	(136)
3	2017	71,519	158	266	62	(204)
4	2018	72,006	154	357	62	(295)
5-year Goal	2019	72,494	151	450	63	(387)
6	2020	72,982	150	479	63	(416)
7	2021	74,745	149	518	64	(454)
8	2022	76,507	148	559	65	(493)
9	2023	78,270	147	600	66	(534)
10-year Goal	2024	80,033	146	643	67	(576)

[13] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for total GPCD from the utility's most recently submitted five-year water conservation plan was used.

3.3 Utility Water Conservation Plan Goals – Water Loss GPCD

Table 3-3 shows how New Braunfels' most recent water loss audit compares with five- and 10-year water loss goals in its water conservation plan. The following definitions pair with the column headers in Table 3-2.

Utility Population – Estimated utility service area population for the years indicated.

Water Loss GPCD Goals – Water loss GPCD goals start with the utility's baseline[14] for water loss GPCD and progress in subsequent years to match 5- and 10-year water loss goals indicated in a utility's five-year water conservation plan on file with the TWDB. The first five annual GPCD goals were developed by spreading the difference between the baseline and five-year goal evenly over five years. The second five annual GPCD goals spread the difference between the five-year goal and 10-year goal evenly over the next five years.

Yearly Savings Goal with Reduction in GPCD (MG) – This column shows what reductions from the baseline water loss GPCD would yield in terms of volume each year as more water is saved. The volumes indicated here are what target water loss GPCD goals look like expressed in million gallons. Annual volumes were derived using the formula: (baseline water loss GPCD – target water loss GPCD for that year) x 365 days ÷ 1,000,000 gallons.

Total Savings from Water Loss Reduction (MG) – The difference between a utility's established baseline for water loss GPCD and the most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB. If water loss GPCD has increased from the utility's baseline to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount. Reference Table 5-2 for savings from water loss reduction.

Over (Short) – The amount that the utility's total savings from water loss reduction is over or below the volume represented by reductions in GPCD each year. If water loss reduction savings are less than these target volumes, the value will appear in parentheses.

Table 3-3. Utility Water Conservation Plan Goals — Water Loss GPCD.

Year #	Year	Utility Population	Water Loss GPCD Goals	Annual Savings Goal with Reduction in GPCD (MG)	Total Savings for All Current Quantified Activities (MG)	Over (Short) (MG)
0	**Baseline**	-	168	0	0	0
1	2015	0	165	0	17	17
2	2016	5-year Goal	161	0	40	40
3	2017	6	158	0	62	62
4	2018	7	154	0	62	62
5-year Goal	2019	8	0	0	63	62
6	2020	9	-1	1	63	63
7	2021	10-year Goal	-2	0	64	64
8	2022	0	-3	0	65	65
9	2023	0	-4	0	66	66
10-year Goal	2024	0	0	0	67	67

[14] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.

4 Implemented Activities

Below is a list of completed activities with estimated water savings. Note that drought response and other measures are not included in the utility's water savings because they are temporary, awareness-based or not able to be accurately quantified on an annual basis.

These are not savings projections of potential future activities. Estimated savings are based on measures that have actually been implemented. If savings are shown to persist in future years, it is because the measure is permanent, such as an ordinance, or the savings are assumed to continue for the reason listed under the itemized activity. Estimated savings from water rate increases are the one exception to these conditions.

Water Rate Increases

Savings from water rate increases were included because entities such as the U.S. Environmental Protection Agency and others indicate specific savings for utilities that raise rates (Texas Water Development Board, 2013; U.S. E.P.A., 1998; Whitcomb, 1999). This project includes surveys of several utilities that have minimal education efforts, perform no other substantive conservation activities, and yet experienced significant demand reduction that coincided with rate increases. In those cases, savings estimates matched up closely with decreases in total GPCD. For many smaller utilities, especially those with customers lacking disposable income, this measure is the only tool used to conserve other than water loss reduction.

The following assumptions were made for water rate increases:

- The model assumes that savings persist into future years because it is expected that the utility will continue to make periodic rate increases in line with the percentage increases from previous years.
- Only the last two rate increases for a utility were quantified.
- Savings grow with demand because as new customers enter the service area, they are assumed to adhere to the same price elasticity model estimates.
- A weighted average for savings was used when rate increases differed between residential and industrial-commercial-institutional (ICI) customers based on the individual utility's customer class breakdown.
- When a utility raised rates using tiered rate conservation pricing, a 50/50 savings split was used when increases differed between base and volumetric rates.
    - The reasoning is that all customers must react to the base increase, yet the pricing signal is stronger when volumetric rate increases affect the higher usage customers.
    - The 50/50 split is reasonable because many customers will not reach the higher volumetric tiers.
    - Studies show that most customers do not actually know they have reached the higher volumetric tiers; just that their bill has increased (Texas Water Development Board, 2013).

4.1 Itemized Activities

1. **Utility Website**
    a. Easy-to-use website with conservation tips and water rates
    b. Features contact information for Public Works staff and customer service

2. **Continuing Public Education**
    a. The utility engages the public in many ways including:
        i. Brochures, bill messages, displays, and exhibits

3. **Water Loss Reduction Savings**[15]
    a. Savings of 0 MG annually in 2015
    b. Water loss reduction savings = the difference between a utility's baseline[16] water loss GPCD submitted in its most recent 5-year water conservation plan and its most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB
    c. If water loss GPCD has increased from the utility's baseline or historic 5-year average to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount.
    d. All savings estimates grow each year at the same rate population figures for the utility grow in the regional water plan.

4. **Water Rate Increases**
    a. Last rate increases:[17]
        i. 2.5% increase in 2016
        ii. 2.5% increase in 2017
    b. Estimated customer demand reduction of 1.0%
    c. Savings is cumulative and based on more than one source[18] (U.S. EPA, 1998; Whitcomb, 1999)
    d. Savings from rate increases are shown to persist over time, however, note that savings from these pricing signals will likely decrease if rates remain the same in future years.

5. **Automatic Meter Reading (AMR)/Advanced Metering Infrastructure (AMI)**
    a. These metering systems can save water in a number of ways, including from water loss reduction through improved leak detection.
    b. All water loss reduction savings associated with this activity are detailed in Section 5, which assessed utility baseline water loss GPCD and most recently reported water loss GPCD to determine water savings.

---

[15] If current water loss levels exceed a utility's baseline, this value is treated as a deduction from total quantified savings.
[16] In the absence of having a baseline figure provided in the utility's most recently submitted 5-year water conservation plan, the historic 5-year average for water loss GPCD in the plan was used.
[17] Correspondence with utility staff.
[18] The study estimates a 2% demand reduction with 10% increase in price on a targeted customer class. By applying a ratio, it is possible to determine the savings for lower or higher percentage increases

c. For estimated water savings that could be increased by implementing meter data management (MDM) and customer engagement portal applications, refer to Section 6 of this report.
    i. With these additional applications, water savings can be achieved through changed customer behavior and other real-time actions that go beyond water loss reduction.

6. Outdoor Landscape Evaluations (SF)

a. 786 outdoor evaluations performed since 2010
b. Estimated 8,000 gallons per year for each system evaluation (A&N Technical Services, 2005; Whitcomb, 2000)
    i. Assumed 75% savings from typical indoor and outdoor survey when only outdoor watering is evaluated
c. Approximately 22 gallons per day
d. Greater savings during peak periods
e. Lesser savings during off-peak periods
f. 20% decay rate per year attributed to customer behavior (A&N Technical Services, 2005)

7. Rain Barrels

a. In Region L, estimated savings of 18 gallons per year per gallon of capacity rebated, sold, or distributed (GDS Associates, 2002).
b. 42,214 gallons of capacity issued from 2011 – 2016
c. Amount of capacity issued each year provided by staff
d. Estimated 10-year useful life for most barrels

8. High Efficiency (HE) Toilet Replacement Program (SF/MF)

a. 604 toilets replaced between 2010 – 2015
b. Number of toilets per year provided by staff
c. Estimated 10,390 gallons per year per toilet (A&N Technical Services, 2005)
d. MF toilet replacements could save more, but without knowing how many were replaced for SF/MF customers, chose conservative estimate for SF for all replacements
e. Savings carry on indefinitely because replacement toilet will be as efficient

9. Clotheswasher Replacement Program (SF)

a. 1,001 rebates issued from 2010 – 2016
b. Rebates per year provided by staff
c. Estimated 7,030 gallons per year per washer (A&N Technical Services, 2005; THELMA, 1997)
d. 11-year useful life
e. Savings carry on indefinitely because replacement washer will be equally as efficient due to plumbing code and efficiency standards

10. Patio Replacement

a. Used EPA WaterSense Water Budget Tool Formula[19] with baseline 2,160 sq. ft. replacement area for SF residential customers.
b. 100 sq. ft. ratio in the formula yields 2,386 gallons per year per 100 sq. ft. of replacement
c. Assumed patio stays for the life of the home
d. Total of 156,000 sq. ft. replaced from 2014 – 2016

11. Mulch Replacement

a. Used EPA WaterSense Water Budget Tool Formula[20] with baseline 2,160 sq. ft. replacement area for SF residential customers.
b. 100 sq. ft. ratio in the formula yields 2,386 gallons per year per 100 sq. ft. of replacement
c. Conservatively assumed 10-year useful life
    i. Assumed mulch may be replaced by next home owner
d. Total of 1,055,000 sq. ft. replaced from 2014 – 2016

12. Grass Removal (Turf Replacement)

a. Used EPA WaterSense Water Budget Tool Formula[21] with baseline 2,160 sq. ft. replacement area for SF residential customers.
b. 100 sq. ft. ratio in the formula yields 2,386 gallons per year per 100 sq. ft. of replacement
c. Conservatively assumed 10-year useful life
    i. Assumed turf may be replaced by next home owner
d. Total of 495,000 sq. ft. replaced from 2015 – 2016

13. Measures Not Quantified

a. Irrigation — cap on either zones or whole system
b. Customer outreach program to customers with continuous consumption
c. Help finding leaks with new irrigation meters
d. 2007 Ordinance containing:
    i. Time of day water restrictions
    ii. Annual irrigation system analysis for sports fields and other large properties requiring a watering variance
    iii. Cooling towers must have a minimum of 4 cycles of concentration
    iv. New developments must include a model home with certain landscape requirements such as 50% turf.

NOTE: Items under No. 13 help explain disparity (Table 2-5) **between New Braunfels' low GPCD—which is achieving WMS supply volume GPCD targets and 5- and 10-year conservation plan goals—and the activities that the study could confidently measure and quantify. In addition, TWDB's 2011 baseline GPCD of 191 is abnormally high compared to**

[19] $LWR_H = RTM\ [(ET_o \times K_L) - R_a] \times A \times C_u$
[20] $LWR_H = RTM\ [(ET_o \times K_L) - R_a] \times A \times C_u$
[21] $LWR_H = RTM\ [(ET_o \times K_L) - R_a] \times A \times C_u$

average GPCD levels for the utility, making WMS supply volumes steep for a utility of this size.

5 Summary of Savings

Table 5-1. Savings by Water Conservation Activity (MG).

Year	Water Rate Increases	Outdoor Landscape Evaluations (SF)	HE Clothes Washer Rebates (SF)	HE Toilet Rebates (SF/MF)	Rain Barrels	Patio Replacement (100 sq. ft.)	Mulch Replacement (Cubic Yards)	Grass Removal (100 sq. ft.)	Commercial Toilet/Urinal (ICI)	TOTAL SAVINGS
2009										0
2010		0.1	1.8	1.2						3.0
2011		1.0	2.8	2.1	0.0					6.0
2012		1.9	3.3	2.8	0.1					8.1
2013		2.5	4.5	3.8	0.2					11.0

2024	80,033	20.00	0

6 Suggested Activities

Up to four activities were chosen as potential suggested activities for individual reports. These activities are: AMI system with customer portal, twice-per-week (or less) outdoor watering ordinances, strategic water rate increases, and rain barrels.

Activities were chosen because they are:

- Achievable
- Prevalence of vendors that can actually implement them
- Acceptability to city councils, MUD boards, et al.
- Easily adopted
- Cost effective
- Yield high savings relative to cost

AMI systems with customer engagement portals were also chosen because they represent a profusion of future applications that will undoubtedly continue to advance conservation efforts. AMI and meter data management (MDM) companies are developing new and innovative ways to benefit water providers, customers, and ultimately states that are pushing conservation and usage analytics further.

Each utility should be cognizant of the potential impact that these suggested activities may have on its own unique rate and revenue situation.

Benefits to consider:

- Avoided water supply and wastewater costs
    - The higher water purchase, transmission, and distribution costs are, the greater the potential benefit realized when large amounts of water are conserved with these activities.
- Avoided system expansion costs

- Conserving water may allow a utility to postpone building new system capacity by decreasing demand even as population grows.

Costs to consider:

- Staff time and resources
- Unit cost per unit saved
- Implementation costs
- Stakeholder agreement and support
- Other overhead and budget considerations

6.1 Suggested Activities with Savings Estimates

1. Twice-a-week Outdoor Watering Restriction Ordinance
   a. Potentially 6.74% savings of total demand (Hermitte and Mace, 2012; Sierra Club-Lone Star Chapter and National Wildlife Federation, 2015)
   b. Savings could be 299 MG per year with current demand.
   c. See Table 6-1 for potential savings from this measure compared with the city's WMS supply volumes targets.

Table 6-1. Current Savings + Potential Savings from 2x per Week Watering Ordinance (MG).

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Potential Savings from Ordinance	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)
2016	40	0	40	299	117	0	117	222
2017	62	0	62	306	117	0	117	251
2018	62	0	62	313	140	0	140	236
2019	63	0	63	320	163	0	163	220
2020	63	0	63	327	210	0	210	181
2021	64	0	64	335	260	0	260	139
2022	65	0	65	342	310	0	310	97
2023	66	0	66	349	359	0	359	56
2024	67	0	67	356	409	0	409	14
2025	68	0	68	364	459	0	459	(28)
2026	69	0	69	371	509	0	509	(70)
2027	70	0	70	378	559	0	559	(111)
2028	71	0	71	385	609	0	609	(153)
2029	72	0	72	392	659	0	659	(194)
2030	73	0	73	400	709	0	709	(236)
2031	74	0	74	407	776	0	776	(295)
2032	75	0	75	414	843	0	843	(353)
2033	76	0	76	422	910	0	910	(412)
2034	77	0	77	429	977	0	977	(471)
2035	78	0	78	437	1,045	0	1,045	(529)
2036	80	0	80	444	1,112	0	1,112	(588)
2037	81	0	81	452	1,179	0	1,179	(647)
2038	82	0	82	459	1,246	0	1,246	(705)
2039	83	0	83	467	1,314	0	1,314	(764)
2040	84	0	84	474	1,381	0	1,381	(823)

2. Advanced Metering Infrastructure with Customer Engagement Portal

These portals, along with mobile applications and billing statements, can provide customers with much more access to their water use data in simple and compelling formats. This access and comparison with other customers' usage can reduce water use through changed behavior, as well as provide an opportunity for other conservation programs to be offered to the customer for increased adoption and additional savings. AMI systems support leak notification and web portals with real-time data. Any water loss reduction savings that these systems also yield were included in the water loss assessment of individual reports for this project.

- **a.** Specific utility results will vary based on portal features and frequency of customer notifications
- **b.** Potential savings estimate assumes 20% of residential customers will use and save water due to the portal (Westin Engineering, 2015)
- **c.** Estimate assumes customers will save 10% of total annual use due to the portal
  - i. Savings estimate of 10% is an average of results from multiple studies (Chesnutt and Mitchell, 2013; East Bay Municipal Utility District, 2014; IBM, 2011; Texas A&M and Texas Water Resources Institute, 2016; Westin Engineering, 2015)
- **d.** Residential customers' use assumed to make up approximately 67% of all retail customers' use based on utility profile information submitted to the TWDB
  - i. This was the most common percentage of residential use among participating utilities in this project.
  - ii. Actual customer class demand percentages will vary by utility.
- **e.** 20% of residential customers saving 10% with this customer class breakdown amounts to 1.34% of total demand
- **f.** Savings are assumed to increase along with demand as connections increase each year[22]
- **g.** See Table 6-2 for potential savings from this measure compared with the utility's WMS supply volumes targets.

[22] The 10% consumption reduction figure for 20% of residential customers is conservative, but savings could be greater when monitored yearly as customer engagement increases.

Table 6-2. Current Savings + Potential Savings from AMI with Customer Portal (MG).

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Potential Savings from AMI with Customer Portal	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)

Statewide Water Conservation Quantification Project
City of Sabinal Report • 2017

1 Introduction

In Texas' 2017 State Water Plan, municipal water conservation is projected to meet 9.6 percent[1] of the state's future water needs by 2070. According to the 16 regional water plans that comprise the state water plan, this is expected to be achieved through a variety of measures such as installation of water efficient plumbing fixtures, water conservation pricing structures, water system audits, landscape irrigation ordinances, as well as other water conservation activities. The 9.6 percent is "in addition to the estimated share of future passive conservation savings from plumbing codes and water efficiency standards, which are embedded in municipal water demand projections" (Texas Water Development Board, 2017).

In 2015, the Texas Legislature appropriated funds to the Texas Water Development Board (TWDB) to fund a research project principally charged with quantitatively determining the savings of municipal water conservation activities being implemented in relation to the recommended conservation goals (supply volumes) in the State Water Plan. As part of the project, individual reports were completed for all participating utilities.

With this report, utilities will benefit by receiving a clear and concise picture of its water conservation goals alongside estimated savings from quantifiable activities. In the event that current activity savings may not be able to reach long-term goals, this report offers suggestions on how utilities can reach water conservation goals with activities that are effective, easily adopted, have widespread appeal, and are quantifiable.

2 Municipal Conservation Terminology and Review of Methodology Used by Regional Planners

To make use of the results of this study, it is important to understand several key terms used in the water planning process.

What is a water user group?

In this report, a water user group (WUG) refers to a retail water provider in the form a city, municipal utility district, water control and improvement district, special utility district, water supply corporation, fresh water supply district, or other type of water utility. The TWDB further defines WUGs as one of the following (Texas Water Development Board, 2016b):

- Cities and towns with a population of 500 or more
- Non-city utilities providing more than 280 acre-feet per year per year of water for municipal use
- Collective reporting units (CRUs) consisting of grouped utilities having a common association

[1] Equal to 811,224 acre-feet per year in conservation savings.

- County-Wide WUGs:
  - County-Other (Rural/unincorporated areas of municipal water use)
  - Manufacturing
  - Steam electric power generation

What is a recommended water management strategy?

A recommended water management strategy (WMS) is a measure that will help ensure WUGs have adequate water supplies for their end users well into the future. WMS examples include river diversions, groundwater use, reservoir and aquifer development, and irrigation conservation. When WMS is referred to in this report, it refers only to municipal conservation, which may include water loss reduction as a part of the same strategy.

What is a WMS supply volume?

A WMS supply volume is the amount of water that a given strategy is expected to yield each decade in the planning period if carried out by the WUG. In this report, a WMS supply volume is the amount of water recommended to come from municipal water conservation.

Some regional water plans separate this strategy's supply volume into a volume for municipal water conservation and a volume for water loss reduction for each decade. The total strategy supply volume is the sum of both. A regional water plan may also refer to "advanced conservation" as part of this strategy. Advanced conservation usually indicates that the volume could be achieved through a more robust mix of conservation activities described in the plan.

2.1 Regional Planning Group Approach to Determining Supply Volumes

Each regional water planning group (RWPG) is responsible for producing its own individual plan that, if executed, will provide sufficient water to its WUGs throughout a 50-year planning period. These plans are completed in five-year cycles, with the most recent edition being completed in 2016. The 2016 regional plans make up the 2017 State Water Plan, which sets out WMS supply volumes for the years 2020 through 2070.

The decadal WMS supply volumes for municipal conservation were established by each of the RWPGs in much the same manner. The RWPGs generally followed the guidelines of the Texas Legislature's Water Conservation Implementation Task Force on the pace utilities should target to reduce gallons per capita per day (GPCD)[2] consumption levels.

The targeted reductions used by most regions follow this formula:

- For municipal WUGs with water use of 140 GPCD and greater, the goal is to reduce per capita water use by one percent per year until the level of 140 GPCD is reached,

[2] Regional water planning GPCD is defined as the annual volume of water pumped, diverted, or purchased minus the volume exported (sold) to other water systems or large industrial facilities divided by the permanent resident population of the Municipal Water User Group in the regional water planning process divided by 365. Saline and reused/recycled water are not included in this volume (Texas Water Development Board, 2012).

after which, the goal is to reduce per capita water use by one-fourth percent per year for the remainder of the planning period (Texas Water Development Board, 2015j).

The yearly reductions in GPCD for a given WUG are then converted into recommended supply volumes in acre-feet per year for each decade as the reductions in consumption continue. Some regions reduce GPCD by slightly different percentages before and after the 140 GPCD threshold, some do not apply further reductions in GPCD for WUGs once they reach 140 GPCD, while others recommend only "advanced conservation" activities once WUGs meet 140 GPCD.

2.2 Methodology

In order to complete a uniform quantification process, the first engagement was with utilities that agreed to participate and collected as much relevant data as possible. These data included, among many others, historical GPCD consumption figures, advanced metering infrastructure (AMI) specifications, and detailed feedback on each conservation activity being implemented. Personal interviews focused on determining when and to what extent these activities were being employed, as well as assessing plans to continue such conservation. Examples of frequently implemented activities include tiered water rate conservation pricing, strategic water rate increases, outdoor irrigation audits and ordinances, and rain barrel distribution.

Subsequently, each utility's conservation activities were quantified through several different means, including evidence-based studies, utility field results and savings determinations, manufacturer guarantees, water loss audits, TWDB studies, and other information that assigned a savings value to the activity's implementation.

Every conservation activity studied and quantified has a gallons-per-year estimate, useful life, and decay rate (if applicable) associated with it. Some activities' savings are projected to grow as demand grows over time, while some savings are constant each year and subside once useful life has run its course. For expanded methodology and details on studies and formulas used to determine activity savings, refer to Section 6 of the State Report included as part of this document.

Once analyzed, the resulting savings estimates from each utility were compared with the recommended WMS supply volumes in its respective regional plan to determine if the savings met, exceeded, or fell short of those volumes. Individual utility savings were aggregated to compare with regional volumes, and regional savings were aggregated to compare with state volumes.

It is important to note that this report quantified activity savings—not including water loss reduction—for the WMS supply volume comparison dating back to 2012. The reason for this is, with a few exceptions, the regional planners used 2011 as the base year for establishing potential WMS supply volumes.[3] In addition, any conservation savings achieved through 2011 are assumed to be accounted for in the regional water planning GPCD for that year.[4] Thus, quantifying from 2012 and forward is the most accurate way to determine if utilities are meeting

[3] Confirmed via personal communication with Region C, H, K, and L Plan consultants.
[4] It was established with TWDB planning staff that 2011 GPCD levels were chosen because they represented the most current water use and conservation patterns at the time.

the recommended conservation volumes in the regional plans. This assumption is by no means 100 percent accurate, however. Some previously implemented activities' savings persist into future years beyond this starting point, while some activities' savings have ceased. One year's GPCD will not necessarily include all savings yielded by conservation activities that came before it, but the quantification assessment must have a starting point.

2.3 Quantifiable Savings

The key to the project being useful and reliable is that the results from year to year are measurable. Quantifying conservation activities that can be accurately measured provides greater certainty and better planning for all stakeholders.

While many utilities are engaged in a variety of conservation activities, not all can currently be properly measured. Some examples of these activities include education initiatives, website and social media engagement, and enforcement for water waste. That does not mean these measures are not essential. Education of consumers, for example, is a fundamental activity that makes all others effective, but little hard data exists to quantify the results of education alone.

In addition, the work of conservation coordinators can have a particularly significant effect on the savings of all other activities, but the specific savings attributed to that staff role is difficult to quantify.

3 Results

This report compares Sabinal's current water conservation activities and their quantified savings to two metrics: 1) Region L Water Plan's (Texas Water Development Board, 2016j) recommended WMS supply volumes for municipal conservation, and 2) Sabinal's own 5- and 10-year goals as established in its most recent water conservation plan submitted to the TWDB.

The WMS supply volumes for municipal water conservation are laid out by decade (2020 – 2070) in the regional water plans to serve as benchmarks for what each utility could achieve via that strategy during a 50-year planning period.[5]

The 5- and 10-year goals in Sabinal's most recent water conservation plan are established by the utility as realistic targets for reducing consumption over that timeframe. These reductions[6] are expressed in decreasing total GPCD[7] consumption and water loss GPCD.[8] [9]

The estimated savings in Tables 3-1 through 3-3 indicate the best information available as

[5] Some regional water plans separate this strategy volume into a volume for water conservation and a volume for water loss reduction for each decade. The total strategy volume is the sum of both.

[6] Occasionally, some utilities expect consumption to increase due to various reasons, such as an incoming industrial presence expected to raise consumption figures for the entire service area.

[7] As defined in TWDB water conservation plan annual report (Texas Water Development Board, 2016o): (Total Gallons in System ÷ Permanent Population) ÷ 365

[8] These plans also have targets for residential GPCD and water loss as a percentage (rather than GPCD), but this report does not address those goals.

[9] As defined in TWDB water conservation plan annual report (Texas Water Development Board, 2016o): (Total Water Loss ÷ Permanent Population) ÷ 365

provided by utility staff. Some ongoing activities may not be known and are within a utility's service area are implemented on a micro-scale that may not be quantified. Individual households and businesses may be implementing conservation measures that are unknown and therefore cannot be included in the report.

Explanation of approach to assessing water loss reduction savings

Water loss reduction savings are defined as the volume of water participating utilities are realizing from their water loss mitigation efforts. For this report, this value is the difference between each individual utility's baseline[10] for water loss GPCD and its most recent water loss GPCD reported in 2015 water loss audits on file with TWDB. Savings from all water loss reduction efforts—including pipe replacements and leak repair—are assumed to be included in this comparison to a utility's baseline.

Note that because a single year (2015) value was used for comparison, it is possible that the 2015 value could be anomalous due to a number of events that may have occurred that year, such as a water main break, a particularly wet year, or a robust effort by the utility to curtail water loss. This will distort future savings figures that were carried forward in the study because water loss will inevitably increase or decrease in later years.

Ideally, using a rolling five-year average in the calculation would correct such anomalies. However, there was insufficient data to do that for every utility. The approach was to use the most complete water loss data possible, which was represented by the 2015 water loss audit. This problem will be further minimized, as continued data collection will allow five-year averages to be calculated for a majority of utilities.

In this way, water loss savings estimates are different from all other activity savings estimates in the project. Whether savings were positive or negative depended on where individual utilities established their own baselines or where their five-year average started, and what water loss GPCD value was reported in 2015.

3.1 Current Savings Compared to Conservation WMS Supply Volume (in million gallons) in Regional Water Plan

Table 3-1 shows the 2070 outlook for Sabinal with the utility's yearly recommended WMS supply volume in million gallons (MG) alongside its water savings from implemented activities, including from water loss reduction. These activities and their associated savings are covered in greater detail in Sections 4 and 5.

Starting in 2015, this table compares all quantified conservation activity and the recommended conservation WMS supply volume for the planning period. The following definitions pair with the column headers in Table 3-1.

<u>Actual Current Conservation Activity Savings</u> – All quantified activities currently being performed by the utility, *excluding* savings from water loss reduction. The regional planners used

[10] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.

2011 GPCD as the baseline for determining future conservation WMS supply volumes, therefore the study quantifies utility savings starting in 2012 for this comparison.

Actual Water Loss Reduction Savings (as of 2015) – The difference between the baseline[11] for water loss GPCD and most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB. [12] The summary of these savings can be referenced in Table 5-1.

Total Savings from All Conservation Activity – Actual Current Conservation Activity Savings plus Actual Water Loss Reduction Savings (as of 2015).

Conservation WMS Volume – The recommended municipal water conservation supply volume in the regional plan for the decades ranging from 2020 to 2070. These volumes are converted to MG from the values listed in the plan in acre-feet and then calculated in annual increments.

Water Loss Reduction WMS Volume – Some regional water plans have a separate WMS volume for water conservation and for water loss reduction for each decade. If a WUG's regional plan has a WMS volume for water loss reduction, this column will have values other than zero.

Total Yearly WMS Volume – The sum of the Conservation WMS Volume and Water Loss Reduction WMS Volume.

Over (Short) – The amount that the utility's Total Savings from All Conservation Activity (since 2012), is over or below the Total Yearly WMS Volume in the regional water plan. If the amount falls below the WMS volume, it will appear in parentheses.

[11] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.
[12] If water loss GPCD has increased from the utility's baseline or historic five-year average to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount.

Table 3-1. Current Savings Compared to Conservation WMS Supply Volume (MG) in Regional Water Plan.

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)

3.2 Utility Water Conservation Plan Goals – Total GPCD

Table 3-2 shows how Sabinal's quantified savings from its implemented activities compare with 5- and 10-year goals established in its individual water conservation plan submitted to the TWDB. The following definitions pair with the column headers in Table 3-2.

Utility Population – Estimated utility service area population for the years indicated.

Total GPCD Goals – Total GPCD goals start with the utility's baseline[13] for total GPCD and progress in subsequent years to match 5- and 10-year goals indicated in a utility's five-year water conservation plan on file with the TWDB. The first five annual GPCD goals were developed by spreading the difference between the baseline and five-year goal evenly over five years. The second five annual GPCD goals spread the difference between the five-year goal and 10-year goal evenly over the next five years.

Annual Savings Goal with Reduction in GPCD (MG) – This column shows what reductions from the baseline GPCD would yield in terms of volume each year as more water is saved. The volumes indicated here are what target GPCD goals look like expressed in million gallons. Annual volumes were derived using the formula: (baseline total GPCD – target total GPCD for that year) x 365 days ÷ 1,000,000 gallons.

Total Savings for All Current Quantified Activities (MG) – Total quantified savings for all current conservation activities and savings from water loss reduction.

Over (Short) – The amount that the utility's total quantified savings for all current conservation activities (since 2012), including water loss reduction, is over or below the volume represented by reductions in GPCD each year. If the quantified savings are less than these target volumes, the value will appear in parentheses.

Table 3-2. Utility Water Conservation Plan Goals — Total GPCD.

Year #	Year	Utility Population	Total GPCD Goals	Annual Savings Goal with Reduction in GPCD (MG)	Total Savings for All Current Quantified Activities (MG)	Over (Short) (MG)
0	**Baseline**	-	169	0.0	0	0
1	2,015	1,750	169	0	(32)	(32)
2	2,016	1,770	169	0	(32)	(33)
3	2,017	1,791	168	0	(33)	(33)
4	2,018	1,811	168	1	(33)	(34)
5-year Goal	2,019	1,832	168	1	(33)	(34)
6	2,020	1,852	168	1	(34)	(35)
7	2,021	1,869	168	1	(34)	(35)
8	2,022	1,887	167	1	(34)	(36)
9	2,023	1,904	167	1	(35)	(36)
10-year Goal	2,024	1,922	167	1	(35)	(36)

[13] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for total GPCD from the utility's most recently submitted five-year water conservation plan was used.

3.3 Utility Water Conservation Plan Goals – Water Loss GPCD

Table 3-3 shows how Sabinal's most recent water loss audit compares with 5- and 10-year water loss goals in its water conservation plan. The following definitions pair with the column headers in Table 3-2.

Utility Population – Estimated utility service area population for the years indicated.

Water Loss GPCD Goals – Water loss GPCD goals start with the utility's baseline[14] for water loss GPCD and progress in subsequent years to match 5- and 10-year water loss goals indicated in a utility's five-year water conservation plan on file with the TWDB. The first five annual GPCD goals were developed by spreading the difference between the baseline and five-year goal evenly over five years. The second five annual GPCD goals spread the difference between the five-year goal and 10-year goal evenly over the next five years.

Yearly Savings Goal with Reduction in GPCD (MG) – This column shows what reductions from the baseline water loss GPCD would yield in terms of volume each year as more water is saved. The volumes indicated here are what target water loss GPCD goals look like expressed in million gallons. Annual volumes were derived using the formula: (baseline water loss GPCD – target water loss GPCD for that year) x 365 days ÷ 1,000,000 gallons.

Total Savings from Water Loss Reduction (MG) – The difference between a utility's established baseline for water loss GPCD and the most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB. If water loss GPCD has increased from the utility's baseline to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount. Reference Table 5-1 for savings from water loss reduction.

Over (Short) – The amount that the utility's total savings from water loss reduction is over or below the volume represented by reductions in GPCD each year. If water loss reduction savings are less than these target volumes, the value will appear in parentheses.

Table 3-3. Utility Water Conservation Plan Goals — Water Loss GPCD.

Year #	Year	Utility Population	Water Loss GPCD Goals	Yearly Savings Goal with Reduction in GPCD (MG)	Total Savings from Water Loss Reduction (MG)	Over (Short) (MG)
0	**Baseline**	-	9.00	0	0	0
1	2,015	1,750	9	0	(32)	(32)
2	2,016	1,770	9	0	(32)	(32)
3	2,017	1,791	9	0	(33)	(33)
4	2,018	1,811	9	0	(33)	(33)
5-year Goal	2,019	1,832	9	0	(33)	(33)
6	2,020	1,852	9	0	(34)	(34)
7	2,021	1,869	9	0	(34)	(34)
8	2,022	1,887	9	0	(34)	(34)
9	2,023	1,904	9	0	(35)	(35)
10-year Goal	2,024	1,922	9	0	(35)	(35)

[14] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.

4 Implemented Activities

Below is a list of completed activities with estimated water savings. Note that drought response and other measures are not included in the utility's water savings because they are temporary, awareness-based or not able to be accurately quantified on an annual basis.

These are not savings projections of potential future activities. Estimated savings are based on measures that have actually been implemented. If savings are shown to persist in future years, it is because the measure is permanent, such as an ordinance, or the savings are assumed to continue for the reason listed under the itemized activity. Estimated savings from water rate increases are the one exception to these conditions.

Water Rate Increases

Savings from water rate increases were included because entities such as the U.S. Environmental Protection Agency and others indicate specific savings for utilities that raise rates (Texas Water Development Board, 2013; U.S. E.P.A., 1998; Whitcomb, 1999). This project includes surveys of several utilities that have minimal education efforts, perform no other substantive conservation activities, and yet experienced significant demand reduction that coincided with rate increases. In those cases, savings estimates matched up closely with decreases in total GPCD. For many smaller utilities, especially those with customers lacking disposable income, this measure is the only tool used to conserve other than water loss reduction.

The following assumptions were made for water rate increases:

- The model assumes that savings persist into future years because it is expected that the utility will continue to make periodic rate increases in line with the percentage increases from previous years.
- Only the last two rate increases for a utility were quantified.
- Savings grow with demand because as new customers enter the service area, they are assumed to adhere to the same price elasticity model estimates.
- A weighted average for savings was used when rate increases differed between residential and industrial-commercial-institutional (ICI) customers based on the individual utility's customer class breakdown.
- When a utility raised rates using tiered rate conservation pricing, a 50/50 savings split was used when increases differed between base and volumetric rates.
    - The reasoning is that all customers must react to the base increase, yet the pricing signal is stronger when volumetric rate increases affect the higher usage customers.
    - The 50/50 split is reasonable because many customers will not reach the higher volumetric tiers.
    - Studies show that most customers do not actually know they have reached the higher volumetric tiers; just that their bill has increased (Texas Water Development Board, 2013).

4.1 Itemized Activities

1. **Utility Website**
   a. Easy-to-use website with conservation tips and water rates
   b. Features contact information for Public Works staff and customer service

2. **Continuing Public Education**
   a. The utility engages the public in many ways including:
      i. Brochures, bill messages, displays, and exhibits

3. **Water Loss Reduction Savings**[15]
   a. Loss of 32 MG annually in 2015
   b. Water loss reduction savings = the difference between a utility's baseline[16] water loss GPCD submitted in its most recent 5-year water conservation plan and its most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB
   c. If water loss GPCD has increased from the utility's baseline or historic 5-year average to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount.
   d. All savings estimates grow each year at the same rate population figures for the utility grow in the regional water plan.

[15] If current water loss levels exceed a utility's baseline, this value is treated as a deduction from total quantified savings.
[16] In the absence of having a baseline figure provided in the utility's most recently submitted 5-year water conservation plan, the historic 5-year average for water loss GPCD in the plan was used.

5 Summary of Savings

Table 5-1. Savings from Water Loss Reduction (MG).

Year	Utility Population	Water Loss GPCD	Total Savings from Water Loss Reduction
Baseline	-	9.00	0
2015	1,750	59.00	(32)
2016	1,770	59.00	(32)
2017	1,791	59.00	(33)
2018	1,811	59.00	(33)
2019	1,832	59.00	(33)
2020	1,852	59.00	(34)
2021	1,869	59.00	(34)
2022	1,887	59.00	(34)
2023	1,904	59.00	(35)
2024	1,922	59.00	(35)

6 Suggested Activities

Up to four activities were chosen as potential suggested activities for individual reports. These activities are: AMI system with customer portal, twice-per-week (or less) outdoor watering ordinances, strategic water rate increases, and rain barrels.

Activities were chosen because they are:

- Achievable
- Prevalence of vendors that can actually implement them
- Acceptability to city councils, MUD boards, et al.
- Easily adopted
- Cost effective
- Yield high savings relative to cost

AMI systems with customer engagement portals were also chosen because they represent a profusion of future applications that will undoubtedly continue to advance conservation efforts. AMI and meter data management (MDM) companies are developing new and innovative ways to benefit water providers, customers, and ultimately states that are pushing conservation and usage analytics further.

Each utility should be cognizant of the potential impact that these suggested activities may have on its own unique rate and revenue situation.

Benefits to consider:

- Avoided water supply and wastewater costs
    - The higher water purchase, transmission, and distribution costs are, the greater the potential benefit realized when large amounts of water are conserved with these activities.

- Avoided system expansion costs
  - Conserving water may allow a utility to postpone building new system capacity by decreasing demand even as population grows.

Costs to consider:

- Staff time and resources
- Unit cost per unit saved
- Implementation costs
- Stakeholder agreement and support
- Other overhead and budget considerations

6.1 Suggested Activities with Savings Estimates

1. Twice-a-week Outdoor Watering Restriction Ordinance

a. Potentially 6.11% savings of total demand (Hermitte and Mace, 2012; Sierra Club-Lone Star Chapter and National Wildlife Federation, 2015)

i. Average Region L savings

ii. Specific percentage of outdoor usage unknown for your utility at this time

b. Savings could be 9 MG per year with current demand.

c. See Table 6-1 for potential savings from this measure compared with the city's WMS supply volumes targets.

Table 6-1. Current Savings + Potential Savings from 2x per Week Watering Ordinance (MG).

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Potential Savings from Ordinance	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)
2016	0	(32)	(32)	9	4	0	4	(27)
2017	0	(33)	(33)	9	4	0	4	(28)
2018	0	(33)	(33)	9	4	0	4	(29)
2019	0	(33)	(33)	9	5	0	5	(30)
2020	0	(34)	(34)	9	7	0	7	(31)
2021	0	(34)	(34)	9	8	0	8	(33)
2022	0	(34)	(34)	9	9	0	9	(34)
2023	0	(35)	(35)	9	10	0	10	(36)
2024	0	(35)	(35)	9	11	0	11	(37)
2025	0	(35)	(35)	9	13	0	13	(39)
2026	0	(36)	(36)	9	14	0	14	(40)
2027	0	(36)	(36)	9	15	0	15	(42)
2028	0	(36)	(36)	9	16	0	16	(43)
2029	0	(37)	(37)	9	17	0	17	(45)
2030	0	(37)	(37)	9	19	0	19	(46)
2031	0	(37)	(37)	10	20	0	20	(48)
2032	0	(38)	(38)	10	21	0	21	(49)
2033	0	(38)	(38)	10	22	0	22	(51)
2034	0	(38)	(38)	10	24	0	24	(52)
2035	0	(38)	(38)	10	25	0	25	(54)
2036	0	(39)	(39)	10	26	0	26	(55)
2037	0	(39)	(39)	10	28	0	28	(57)
2038	0	(39)	(39)	10	29	0	29	(58)
2039	0	(39)	(39)	10	30	0	30	(60)
2040	0	(40)	(40)	10	32	0	32	(61)

2. Advanced Metering Infrastructure with Customer Engagement Portal

These portals, along with mobile applications and billing statements, can provide customers with much more access to their water use data in simple and compelling formats. This access and comparison with other customers' usage can reduce water use through changed behavior, as well as provide an opportunity for other conservation programs to be offered to the customer for increased adoption and additional savings. AMI systems support leak notification and web portals with real-time data. Any water loss reduction savings that these systems also yield were included in the water loss assessment of individual reports for this project.

- **a.** Specific utility results will vary based on portal features and frequency of customer notifications
- **b.** Potential savings estimate assumes 20% of residential customers will use and save water due to the portal (Westin Engineering, 2015)
- **c.** Estimate assumes customers will save 10% of total annual use due to the portal
    - i. Savings estimate of 10% is an average of results from multiple studies (Chesnutt and Mitchell, 2013; East Bay Municipal Utility District, 2014; IBM, 2011; Texas A&M and Texas Water Resources Institute, 2016; Westin Engineering, 2015)
- **d.** Residential customers' use assumed to make up approximately 67% of all retail customers' use based on utility profile information submitted to the TWDB
    - i. This was the most common percentage of residential use among participating utilities in this project.
    - ii. Actual customer class demand percentages will vary by utility.
- **e.** 20% of residential customers saving 10% with this customer class breakdown amounts to 1.34% of total demand
- **f.** Savings are assumed to increase along with demand as connections increase each year[17]
- **g.** See Table 6-2 for potential savings from this measure compared with the utility’s WMS supply volumes targets.

---

[17] The 10% consumption reduction figure for 20% of residential customers is conservative, but savings could be greater when monitored yearly as customer engagement increases.

Table 6-2. Current Savings + Potential Savings from AMI with Customer Portal (MG).

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Potential Savings from AMI with Customer Portal	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)
2016	0	(32)	(32)	2	4	0	4	(34)
2017	0	(33)	(33)	2	4	0	4	(34)

2021	0	(34)	(34)	2	8	0	8	(40)
2022	0	(34)	(34)	2	9	0	9	(41)
2023	0	(35)	(35)	2	10	0	10	(43)
2024	0	(35)	(35)	2	11	0	11	(44)
2025	0	(35)	(35)	2	13	0	13	(46)
2026	0	(36)	(36)	2	14	0	14	(47)
2027	0	(36)	(36)	2	15	0	15	(49)
2028	0	(36)	(36)	2	16	0	16	(50)
2029	0	(37)	(37)	2	17	0	17	(52)
2030	0	(37)	(37)	2	19	0	19	(53)
2031	0	(37)	(37)	2	20	0	20	(55)
2032	0	(38)	(38)	2	21	0	21	(57)
2033	0	(38)	(38)	2	22	0	22	(58)
2034	0	(38)	(38)	2	24	0	24	(60)
2035	0	(38)	(38)	2	25	0	25	(61)
2036	0	(39)	(39)	2	26	0	26	(63)
2037	0	(39)	(39)	2	28	0	28	(64)
2038	0	(39)	(39)	2	29	0	29	(66)
2039	0	(39)	(39)	2	30	0	30	(68)
2040	0	(40)	(40)	2	32	0	32	(69)

3. Water Rate Increase
- **a.** For every 10% increase, estimated savings could be 2% of utility total demand.
- **b.** Approximately 3 MG of savings per year with current demand
- **c.** Savings is cumulative and based on more than one source[18] (U.S. EPA, 1998; Whitcomb, 1999)
- **d.** See Table 6-3 for potential savings from this measure compared with the utility's conservation goals.

[18] The study estimates a 2% demand reduction with 10% increase in price on a targeted customer class. By applying a ratio, it is possible to determine the savings for lower or higher percentage increases.

Table 6-3. Current Savings + Potential Savings from 10% Water Rate Increase (MG).

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Potential Savings from Water Rate Increase	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)
2016	0	(32)	(32)	3	4	0	4	(33)
2017	0	(33)	(33)	3	4	0	4	(33)
2018	0	(33)	(33)	3	4	0	4	(35)
2019	0	(33)	(33)	3	5	0	5	(36)
2020	0	(34)	(34)	3	7	0	7	(37)
2021	0	(34)	(34)	3	8	0	8	(39)
2022	0	(34)	(34)	3	9	0	9	(40)
2023	0	(35)	(35)	3	10	0	10	(42)
2024	0	(35)	(35)	3	11	0	11	(43)
2025	0	(35)	(35)	3	13	0	13	(45)
2026	0	(36)	(36)	3	14	0	14	(46)
2027	0	(36)	(36)	3	15	0	15	(48)
2028	0	(36)	(36)	3	16	0	16	(49)
2029	0	(37)	(37)	3	17	0	17	(51)
2030	0	(37)	(37)	3	19	0	19	(52)
2031	0	(37)	(37)	3	20	0	20	(54)
2032	0	(38)	(38)	3	21	0	21	(56)
2033	0	(38)	(38)	3	22	0	22	(57)
2034	0	(38)	(38)	3	24	0	24	(59)
2035	0	(38)	(38)	3	25	0	25	(60)
2036	0	(39)	(39)	3	26	0	26	(62)
2037	0	(39)	(39)	3	28	0	28	(63)
2038	0	(39)	(39)	3	29	0	29	(65)
2039	0	(39)	(39)	3	30	0	30	(66)
2040	0	(40)	(40)	3	32	0	32	(68)

4. Rain Barrels

   a. In Region L, utilities could save approximately 17 gallons per year per gallon of capacity rebated, sold, or distributed (GDS Associates, 2002).

   b. Estimated 10-year useful life for most barrels

TWDB Statewide Water Conservation Quantification Project
San Antonio Water System Report • 2017

1 Introduction

In Texas' 2017 State Water Plan, municipal water conservation is projected to meet 9.6 percent[1] of the state's future water needs by 2070. According to the 16 regional water plans that comprise the state water plan, this is expected to be achieved through a variety of measures such as installation of water efficient plumbing fixtures, water conservation pricing structures, water system audits, landscape irrigation ordinances, as well as other water conservation activities. The 9.6 percent is "in addition to the estimated share of future passive conservation savings from plumbing codes and water efficiency standards, which are embedded in municipal water demand projections" (Texas Water Development Board, 2017).

In 2015, the Texas Legislature appropriated funds to the Texas Water Development Board (TWDB) to fund a research project principally charged with quantitatively determining the savings of municipal water conservation activities being implemented in relation to the recommended conservation goals (supply volumes) in the State Water Plan. As part of the project, individual reports were to be completed for all participating utilities.

With this report, utilities will benefit by receiving a clear and concise picture of its water conservation goals alongside estimated savings from quantifiable activities. In the event that current activity savings may not be able to reach long-term goals, this report offers suggestions on how utilities can reach water conservation goals with activities that are effective, easily adopted, have widespread appeal, and are quantifiable.

2 Municipal Conservation Terminology and Review of Methodology Used by Regional Planners

To make use of the results of this study, it is important to understand several key terms used in the water planning process.

What is a water user group?

In this report, a water user group (WUG) refers to a retail water provider in the form a city, municipal utility district, water control and improvement district, special utility district, water supply corporation, fresh water supply district, or other type of water utility. The TWDB further defines WUGs as one of the following (Texas Water Development Board, 2016b):

- Cities and towns with a population of 500 or more
- Non-city utilities providing more than 280 acre-feet per year per year of water for municipal use
- Collective reporting units (CRUs) consisting of grouped utilities having a common

[1] Equal to 811,224 acre-feet per year in conservation savings.

association

- County-Wide WUGs:
    - County-Other (Rural/unincorporated areas of municipal water use)
    - Manufacturing
    - Steam electric power generation

What is a recommended water management strategy?

A recommended water management strategy (WMS) is a measure that will help ensure WUGs have adequate water supplies for their end users well into the future. WMS examples include river diversions, groundwater use, reservoir and aquifer development, and irrigation conservation. When WMS is referred to in this report, it refers only to municipal conservation, which may include water loss reduction as a part of the same strategy.

What is a WMS supply volume?

A WMS supply volume is the amount of water that a given strategy is expected to yield each decade in the planning period if carried out by the WUG. In this report, a WMS supply volume is the amount of water recommended to come from municipal water conservation.

Some regional water plans separate this strategy's supply volume into a volume for municipal water conservation and a volume for water loss reduction for each decade. The total strategy supply volume is the sum of both. A regional water plan may also refer to "advanced conservation" as part of this strategy. Advanced conservation usually indicates that the volume could be achieved through a more robust mix of conservation activities described in the plan.

2.1 Regional Planning Group Approach to Determining Supply Volumes

Each regional water planning group (RWPG) is responsible for producing its own individual plan that, if executed, will provide sufficient water to its WUGs throughout a 50-year planning period. These plans are completed in five-year cycles, with the most recent edition being completed in 2016. The 2016 regional plans make up the 2017 State Water Plan, which sets out WMS supply volumes for the years 2020 through 2070.

The decadal WMS supply volumes for municipal conservation were established by each of the RWPGs in much the same manner. The RWPGs generally followed the guidelines of the Texas Legislature's Water Conservation Implementation Task Force on the pace utilities should target to reduce gallons per capita per day (GPCD)[2] consumption levels.

The targeted reductions used by most regions follow this formula:

[2] Regional water planning GPCD is defined as the annual volume of water pumped, diverted, or purchased minus the volume exported (sold) to other water systems or large industrial facilities divided by the permanent resident population of the Municipal Water User Group in the regional water planning process divided by 365. Saline and reused/recycled water are not included in this volume (Texas Water Development Board, 2012).

- For municipal WUGs with water use of 140 GPCD and greater, the goal is to reduce per capita water use by one percent per year until the level of 140 GPCD is reached, after which, the goal is to reduce per capita water use by one-fourth percent per year for the remainder of the planning period (Texas Water Development Board, 2015j).

The yearly reductions in GPCD for a given WUG are then converted into recommended supply volumes in acre-feet per year for each decade as the reductions in consumption continue. Some regions reduce GPCD by slightly different percentages before and after the 140 GPCD threshold, some do not apply further reductions in GPCD for WUGs once they reach 140 GPCD, while others recommend only "advanced conservation" activities once WUGs meet 140 GPCD.

2.2 Methodology

In order to complete a uniform quantification process, we first engaged with utilities that agreed to participate and collected as much relevant data as possible. These data included, among many others, historical GPCD consumption figures, advanced metering infrastructure (AMI) specifications, and detailed feedback on each conservation activity being implemented. Personal interviews focused on determining when and to what extent these activities were being employed, as well as assessing plans to continue such conservation. Examples of frequently implemented activities include tiered water rate conservation pricing, strategic water rate increases, outdoor irrigation audits and ordinances, and rain barrel distribution.

We then quantified each utility's conservation activities through several different means, including evidence-based studies, utility field results and savings determinations, manufacturer guarantees, water loss audits, TWDB studies, and other information that assigned a savings value to the activity's implementation.

Every conservation activity studied and quantified has a gallons-per-year estimate, useful life, and decay rate (if applicable) associated with it. Some activities' savings are projected to grow as demand grows over time, while some savings are constant each year and subside once useful life has run its course. Individual reports distributed to each participating utility detail these attributes. For expanded methodology and details on studies and formulas used to determine activity savings, refer to Section 6 of the State Report included as part of this document.

Once analyzed, the resulting savings estimates from each utility were compared with the recommended WMS supply volumes in its respective regional plan to determine if the savings met, exceeded, or fell short of those volumes. Individual utility savings were aggregated to compare with regional volumes, and regional savings were aggregated to compare with state volumes.

It is important to note that this report quantified activity savings—not including water loss reduction—for the WMS supply volume comparison dating back to 2012. The reason for this is, with a few exceptions, the regional planners used 2011 as the base year for establishing potential WMS supply volumes.[3] In addition, any conservation savings achieved through 2011 are

[3] Confirmed via personal communication with Region C, H, K, and L Plan consultants.

assumed to be accounted for in the regional water planning GPCD for that year.[4] Thus, quantifying from 2012 and forward is the most accurate way to determine if utilities are meeting the recommended conservation volumes in the regional plans. This assumption is by no means 100 percent accurate, however. Some previously implemented activities' savings persist into future years beyond this starting point, while some activities' savings have ceased. One year's GPCD will not necessarily include all savings yielded by conservation activities that came before it, but the quantification assessment must have a starting point.

2.3 Quantifiable Savings

The key to the project being useful and reliable is that the results from year to year are measurable. Quantifying conservation activities that can be accurately measured provides greater certainty and better planning for all stakeholders.

While many utilities are engaged in a variety of conservation activities, not all can currently be properly measured. Some examples of these activities include education initiatives, website and social media engagement, and enforcement for water waste. That does not mean these measures are not essential. Education of consumers, for example, is a fundamental activity that makes all others effective, but little hard data exists to quantify the results of education alone.

In addition, the work of conservation coordinators can have a particularly significant effect on the savings of all other activities, but the specific savings attributed to that staff role is difficult to quantify.

3 Results

This report compares San Antonio Water System's (SAWS) current water conservation activities and their quantified savings to two metrics: 1) Region L Water Plan's (Texas Water Development Board, 2016j) recommended WMS supply volumes for municipal conservation, and 2) SAWS' own five- and 10-year goals as established in its most recent water conservation plan submitted to the TWDB.

The WMS supply volumes for municipal water conservation are laid out by decade (2020 – 2070) in the regional water plans to serve as benchmarks for what each utility could achieve via that strategy during a 50-year planning period.[5]

The five- and 10-year goals in SAWS' most recent water conservation plan are established by the utility as realistic targets for reducing consumption over that timeframe. These reductions[6] are expressed in decreasing total GPCD[7] consumption and water loss GPCD.[8 9]

---

[4] It was established with TWDB planning staff that 2011 GPCD levels were chosen because they represented the most current water use and conservation patterns at the time.
[5] Some regional water plans separate this strategy volume into a volume for water conservation and a volume for water loss reduction for each decade. The total strategy volume is the sum of both.
[6] Occasionally, some utilities expect consumption to increase due to various reasons, such as an incoming industrial presence expected to raise consumption figures for the entire service area.
[7] As defined in TWDB water conservation plan annual report (Texas Water Development Board, 2016o): (Total Gallons in System ÷ Permanent Population) ÷ 365

The estimated savings in Tables 3-1 through 3-3 indicate the best information available as provided by utility staff. We are not aware of all activities that are ongoing. Some activities within a utility's service area are implemented on a micro-scale that we cannot yet quantify. Individual households and businesses may be implementing conservation measures that we do not know about and therefore cannot include in this report.

Explanation of approach to assessing water loss reduction savings

Water loss reduction savings are defined as the volume of water participating utilities are realizing from their water loss mitigation efforts. For this report, this value is the difference between each individual utility's baseline[10] for water loss GPCD and its most recent water loss GPCD reported in 2015 water loss audits on file with TWDB. Savings from all water loss reduction efforts—including pipe replacements and leak repair—are assumed to be included in this comparison to a utility's baseline.

Note that because we used a single year (2015) value for comparison, it is possible that the 2015 value could be anomalous due to a number of events that may have occurred that year, such as a water main break, a particularly wet year, or a robust effort by the utility to curtail water loss. This will distort future savings figures we have carried forward in our model because water loss will inevitably increase or decrease in later years.

Ideally, using a rolling five-year average in the calculation would correct such anomalies. However, there was insufficient data to do that for every utility. Our approach was to use the most complete water loss data possible, which was represented by the 2015 water loss audit. This problem will be further minimized, as continued data collection will allow five-year averages to be calculated for a majority of utilities.

In this way, water loss savings estimates are different from all other activity savings estimates in the project. Whether savings were positive or negative depended on where individual utilities established their own baselines or where their five-year average started, and what water loss GPCD value was reported in 2015.

3.1 Current Savings Compared to Conservation WMS Supply Volume (in million gallons) in Regional Water Plan

Table 3-1 shows a 2070 outlook for SAWS with the utility's yearly recommended WMS supply volume in million gallons (MG) alongside its water savings from implemented activities, including from water loss reduction. These activities and their associated savings are covered in greater detail in Sections 4 and 5.

[8] These plans also have targets for residential GPCD and water loss as a percentage (rather than GPCD), but this report does not address those goals.

[9] As defined in TWDB water conservation plan annual report (Texas Water Development Board, 2016o): (Total Water Loss ÷ Permanent Population) ÷ 365

[10] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.

Starting in 2015, this table compares all quantified conservation activity and the recommended conservation WMS supply volume for the planning period. The following definitions pair with the column headers in Table 3-1.

Actual Current Conservation Activity Savings – All quantified activities currently being performed by the utility, excluding savings from water loss reduction. Because the regional planners used 2011 GPCD as the baseline for determining future conservation WMS supply volumes, we have quantified utility savings starting in 2012 for this comparison. The summary of these savings can be referenced in Table 5-1.

Actual Water Loss Reduction Savings (as of 2015) – The difference between the baseline[11] for water loss GPCD and most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB. [12] The summary of these savings can be referenced in Table 5-4.

Total Savings from All Conservation Activity – Actual Current Conservation Activity Savings plus Actual Water Loss Reduction Savings (as of 2015).

Conservation WMS Volume – The recommended municipal water conservation supply volume in the regional plan for the decades ranging from 2020 to 2070. These volumes are converted to MG from the values listed in the plan in acre-feet and then calculated in annual increments.

Water Loss Reduction WMS Volume – Some regional water plans have a separate WMS volume for water conservation and for water loss reduction for each decade. If a WUG's regional plan has a WMS volume for water loss reduction, this column will have values other than zero.

Total Yearly WMS Volume – The sum of the Conservation WMS Volume and Water Loss Reduction WMS Volume.

Over (Short) – The amount that the utility's Total Savings from All Conservation Activity (since 2012), is over or below the Total Yearly WMS Volume in the regional water plan. If the amount falls below the WMS volume, it will appear in parentheses.

[11] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.
[12] If water loss GPCD has increased from the utility's baseline or historic five-year average to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount.

Table 3-1. Current Savings Compared to Conservation WMS Supply Volume (MG) in Regional Water Plan.

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)
2015	3,923	1,336	5,260	2,314	0	2,314	2,946
2016	4,470	1,350	5,819	2,892	0	2,892	2,927

2070	1,818	2,110	3,928	14,266	0	14,266	(10,338)

3.2 Utility Water Conservation Plan Goals – Total GPCD

Table 3-2 shows how SAWS' quantified savings from its implemented activities compare with five- and goals established in its individual water conservation plan submitted to the TWDB. The following definitions pair with the column headers in Table 3-2.

Utility Population – Estimated utility service area population for the years indicated.

Total GPCD Goals – Total GPCD goals start with the utility's baseline[13] for total GPCD and progress in subsequent years to match five- and 10-year goals indicated in a utility's five-year water conservation plan on file with the TWDB. The first five annual GPCD goals were developed by spreading the difference between the baseline and five-year goal evenly over five years. The second five annual GPCD goals spread the difference between the five-year goal and 10-year goal evenly over the next five years.

Annual Savings Goal with Reduction in GPCD (MG) – This column shows what reductions from the baseline GPCD would yield in terms of volume each year as more water is saved. The volumes indicated here are what target GPCD goals look like expressed in million gallons. Annual volumes were derived using the formula: (baseline total GPCD – target total GPCD for that year) x 365 days ÷ 1,000,000 gallons.

Total Savings for All Current Quantified Activities (MG) – Total quantified savings for all current conservation activities and savings from water loss reduction. Refer Section 5 for details on these savings.

Over (Short) – The amount that the utility's total quantified savings for all current conservation activities (since 2012), including water loss reduction, is over or below the volume represented by reductions in GPCD each year. If the quantified savings are less than these target volumes, the value will appear in parentheses.

Table 3-2. Utility Water Conservation Plan Goals — Total GPCD.

Year #	Year	Utility Population	Total GPCD Goals	Annual Savings Goal with Reduction in GPCD (MG)	Total Savings for All Current Quantified Activities (MG)	Over (Short) (MG)
0	**Baseline**	-	143	0	0	0
1	2015	1,743,559	142	891	5,260	4,369
2	2016	1,760,871	140	1,800	5,819	4,020
3	2017	1,778,184	139	2,726	5,983	3,257
4	2018	1,795,496	137	3,670	5,981	2,311
5-year Goal	2019	1,812,809	136	4,632	5,979	1,347
6	2020	1,830,121	136	4,810	6,013	1,203
7	2021	1,852,286	136	5,003	5,984	981
8	2022	1,874,450	135	5,200	6,012	812
9	2023	1,896,615	135	5,400	6,055	655
10-year Goal	2024	1,918,780	135	5,603	6,104	501

[13] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for total GPCD from the utility's most recently submitted five-year water conservation plan was used.

3.3 Utility Water Conservation Plan Goals – Water Loss GPCD

Table 3-3 shows how SAWS' most recent water loss audit compares with five- and 10-year water loss goals in its water conservation plan. The following definitions pair with the column headers in Table 3-2.

Utility Population – Estimated utility service area population for the years indicated.

Water Loss GPCD Goals – Water loss GPCD goals start with the utility's baseline[14] for water loss GPCD and progress in subsequent years to match five- and 10-year water loss goals indicated in a utility's five-year water conservation plan on file with the TWDB. The first five annual GPCD goals were developed by spreading the difference between the baseline and five-year goal evenly over five years. The second five annual GPCD goals spread the difference between the five-year goal and 10-year goal evenly over the next five years.

Yearly Savings Goal with Reduction in GPCD (MG) – This column shows what reductions from the baseline water loss GPCD would yield in terms of volume each year as more water is saved. The volumes indicated here are what target water loss GPCD goals look like expressed in million gallons. Annual volumes were derived using the formula: (baseline water loss GPCD – target water loss GPCD for that year) x 365 days ÷ 1,000,000 gallons.

Total Savings from Water Loss Reduction (MG) – The difference between a utility's established baseline for water loss GPCD and the most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB. If water loss GPCD has increased from the utility's baseline to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount. Reference Table 5-4 for savings from water loss reduction.

Over (Short) – The amount that the utility's total savings from water loss reduction is over or below the volume represented by reductions in GPCD each year. If water loss reduction savings are less than these target volumes, the value will appear in parentheses.

Table 3-3. Utility Water Conservation Plan Goals — Water Loss GPCD.

Year #	Year	Utility Population	Water Loss GPCD Goals	Yearly Savings Goal with Reduction in GPCD (MG)	Total Savings from Water Loss Reduction (MG)	Over (Short) (MG)
0	**Baseline**	-	20.10	0	0	0
1	2015	1,743,559	20.06	25	1,336	1,311
2	2016	1,760,871	20.02	51	1,350	1,298
3	2017	1,778,184	19.98	78	1,363	1,285
4	2018	1,795,496	19.94	105	1,376	1,271
5-year Goal	2019	1,812,809	19.90	132	1,390	1,257
6	2020	1,830,121	19.82	187	1,403	1,216
7	2021	1,852,286	19.74	243	1,420	1,176
8	2022	1,874,450	19.66	301	1,437	1,136
9	2023	1,896,615	19.58	360	1,454	1,094
10-year Goal	2024	1,918,780	19.50	420	1,471	1,051

[14] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.

4 Implemented Activities

Below is a list of completed activities with estimated water savings. Note that drought response and other measures are not included in the utility's water savings because they are temporary, awareness-based or not able to be accurately quantified on an annual basis.

For SAWS, staff provided savings for all activities implemented or enhanced from 2010 through 2015 (San Antonio Water System, 2016). We have used those estimates in this report, and, in some cases, have assumed annual decay rates and useful life for activities commonly employed by other utilities in the broader TWDB study. However, without knowing the full extent of every action performed for a "commercial outdoor consult," for example, these are simply assumptions. Utility staff may find that some assumed annual decay rates and useful life estimates attributed to these activities should be adjusted, but our intention was to be conservative with future savings projections.

In Tables 5-1, 5-2, and 5-3, all total savings figures reported each year by SAWS from 2010 through 2015 are also aggregated each year so that savings are cumulative. For example, the total for 2012 reflects savings of 2,427 MG, which is the sum of the department totals reported in 2010 (835.9 MG), 2011 (856.6 MG), and 2012 (734.2 MG).

In addition, during our interview and in other collected materials, SAWS staff emphasized that many indoor activities would largely be phased out—due to market saturation and other various reasons—and greater focus would be placed on outdoor activities. For this reason, we projected savings for most outdoor activities forward 10 years using similar savings achieved in past years.

Water Rate Increases

Savings from water rate increases were included because entities such as the U.S. Environmental Protection Agency and others indicate specific savings for utilities that raise rates (Texas Water Development Board, 2013; U.S. E.P.A., 1998; Whitcomb, 1999). During the project, we were able to survey several utilities that have minimal education efforts, perform no other substantive conservation activities, and yet experienced significant demand reduction that coincided with rate increases. In those cases, savings estimates matched up closely with decreases in total GPCD. For many smaller utilities, especially those with customers lacking disposable income, this measure is the only tool used to conserve other than water loss reduction.

The following assumptions were made for water rate increases:

- The model assumes that savings persist into future years because it is expected that the utility will continue to make periodic rate increases in line with the percentage increases from previous years.
- Only the last two rate increases for a utility were quantified.
- Savings grow with demand because as new customers enter the service area, they are assumed to adhere to the same price elasticity model estimates.

- A weighted average for savings was used when rate increases differed between residential and industrial-commercial-institutional (ICI) customers based on the individual utility's customer class breakdown.
- When a utility raised rates using tiered rate conservation pricing, we used a 50/50 savings split when increases differed between base and volumetric rates.
  - The reasoning is that all customers must react to the base increase, yet the pricing signal is stronger when volumetric rate increases affect the higher usage customers.
  - The 50/50 split is reasonable because many customers will not reach the higher volumetric tiers.
  - Studies show that most customers do not actually know they have reached the higher volumetric tiers; just that their bill has increased (Texas Water Development Board, 2013).

4.1 Itemized Activities

4.1.1 Outdoor Activities

1. **Water Rate Increases (service area-wide activity)**
   a. Last two rate increases:
      i. 0.085% combined base rate increase
      ii. 0.078% combined volumetric rate increase
      iii. 0.163% overall increase with 50/50 weight given to base and volumetric rate increases = 0.17% of total demand
   b. Savings are cumulative and based on TWDB's Best Management Practices for Municipal Water Users Guide[15] (TWDB, 2013), as well as Environmental Protection Agency guidelines and other sources (U.S. EPA, 1998; Whitcomb, 1999)

2. **Home and Irrigation Consult**
   a. Annual savings projections provided by SAWS (San Antonio Water System, 2016)
   b. Savings projected through 2025 based on similar savings achieved through 2015
   c. 20% annual decay rate attributed to customer behavior for similar programs (A&N Technical Services, 2005)
   d. Decay rate applies starting in 2025

3. **Home (Only) Consult**
   a. Annual savings projections provided by SAWS (San Antonio Water System, 2016)
   b. Savings projected through 2025 based on similar savings achieved through 2015
   c. 20% annual decay rate attributed to customer behavior for similar programs (A&N Technical Services, 2005)
   d. Decay rate applies starting in 2025

[15] Water Conservation Advisory Council (WCAC) estimates 2% demand reduction with 10% increase in price on a targeted customer class. By applying a ratio, we can determine the savings for lower or higher percentage increases.

4. **Irrigation (Only) Consult**
    a. Annual savings projections provided by SAWS (San Antonio Water System, 2016)
    b. 20% annual decay rate attributed to customer behavior for similar programs (A&N Technical Services, 2005)

5. **Commercial Consult**
    a. Annual savings projections provided by SAWS (San Antonio Water System, 2016)
    b. Savings projected through 2025 based on similar savings achieved through 2015
    c. 20% annual decay rate attributed to customer behavior for similar programs (A&N Technical Services, 2005)
    d. Decay rate applies starting in 2025

6. **Large Landscape Survey (5 acres)**
    a. Annual savings projections provided by SAWS (San Antonio Water System, 2016)
    b. Savings projected through 2025 based on similar savings achieved through 2015
    c. 20% annual decay rate attributed to customer behavior for similar programs (A&N Technical Services, 2005)
    d. Decay rate applies starting in 2025

7. **E-newsletter**
    a. Annual savings projections provided by SAWS (San Antonio Water System, 2016)
    b. Discontinued after 2012

8. **WaterSaver Landscape**
    a. Annual savings projections provided by SAWS (San Antonio Water System, 2016)
    b. Savings projected through 2025
    c. 20% annual decay rate attributed to customer behavior for similar programs (A&N Technical Services, 2005)

9. **Top 1% Program**
    a. Annual savings projections provided by SAWS (San Antonio Water System, 2016)
    b. Savings projected through 2025
    c. 20% annual decay rate attributed to customer behavior for similar programs (A&N Technical Services, 2005)

10. **Residential Irrigation Rebate**
    a. Annual savings projections provided by SAWS (San Antonio Water System, 2016)
    b. Savings projected through 2025
    c. Applied 20% annual decay rate starting in 2025

        i. If rebate primarily includes device(s), a useful life determination would be more applicable to savings estimate

11. Commercial Irrigation Rebate
   a. Annual savings projections provided by SAWS (San Antonio Water System, 2016)
   b. Savings projected through 2025
   c. Applied 20% annual decay rate starting in 2025
        i. If rebate primarily includes device(s), a useful life determination would be more applicable to savings estimate

12. Summer/Fall Coupons
   a. Annual savings projections provided by SAWS (San Antonio Water System, 2016)
   b. Savings of 8 MG only itemized for 2013 in materials, but value carried over to department totals reported in subsequent years
        i. Applied same value to 2014 and 2015 with no aggregation
   c. Did not assume annual decay rate or useful life because the activity appears discontinued

13. Patioscape Coupons
   a. Annual savings projections provided by SAWS (San Antonio Water System, 2016)
   b. Savings projected through 2025
   c. Assumed 20-year useful life

14. Landscape Coupons
   a. Annual savings projections provided by SAWS (San Antonio Water System, 2016)
   b. Savings projected through 2025
   c. Assumed 10-year useful life
        i. Similar to turf replacements

15. Rain Sensor Coupons
   a. Annual savings projections provided by SAWS (San Antonio Water System, 2016)
   b. Savings projected through 2025
   c. Assumed five-year useful life for sensors

4.1.2 Indoor Activities

16. High-efficiency (HE) Toilet Replacements for Single Family (SF) Customers
   a. Annual savings projections provided by SAWS (San Antonio Water System, 2016)
   b. Savings shown only through 2014
   c. Savings from that year forward carry on indefinitely because replacement fixture will be as efficient due to current plumbing code and efficiency standards

17. HE Toilet Replacements (Commercial)

a. Annual savings projections provided by SAWS (San Antonio Water System, 2016)
b. Savings shown only through 2014
c. Savings from that year forward carry on indefinitely because replacement fixture will be as efficient due to current plumbing code and efficiency standards

18. Hot Water on Demand Program

a. Annual savings projections provided by SAWS (San Antonio Water System, 2016)
b. Did not assume annual decay rate or useful life because the activity appears discontinued

19. HE Clothes Washer Rebates (SF)

a. Annual savings projections provided by SAWS (San Antonio Water System, 2016)
b. Savings reported for 2010 only for this activity
c. 11-year useful life (A&N Technical Services, 2005; THELMA, 1997)

20. HE Clothes Washer Rebates (Commercial)

a. Annual savings projections provided by SAWS (San Antonio Water System, 2016)
b. Savings reported for 2010 – 2013 only for this activity
c. 11-year useful life (A&N Technical Services, 2005; THELMA, 1997)

21. Waterless Urinals Commercial

a. Annual savings projections provided by SAWS (San Antonio Water System, 2016)
b. Savings reported for 2012 only for this activity
c. Assumed that savings from that year forward carry on indefinitely because model will not be replaced by standard urinal

22. Fix-a-Leak Program

a. Annual savings projections provided by SAWS (San Antonio Water System, 2016)
b. Savings reported for 2010 only for this activity
c. Assumed that savings from that year forward carry on indefinitely

23. Plumbers-to-People Program

a. Annual savings projections provided by SAWS (San Antonio Water System, 2016)
b. Savings quantified only through 2016
c. Assumed 20-year useful life for repairs and work performed by plumbers

24. Home Makeover Program

a. Annual savings projections provided by SAWS (San Antonio Water System, 2016)

b. Savings quantified only through 2016
c. Assumed 10-year useful life for work completed during makeover

25. Pool Filters

a. Annual savings projections provided by SAWS (San Antonio Water System, 2016)
b. Savings reported for 2013 and 2014 only for this activity
c. Assumed 10-year useful life for pool filters

26. Custom Rebates (Commercial)

a. Annual savings projections provided by SAWS (San Antonio Water System, 2016)
b. Savings reported for 2013 – 2015 only for this activity
c. Assumed 10-year useful life for item(s) rebated

27. Large Scale Retrofit

a. Annual savings projections provided by SAWS (San Antonio Water System, 2016)
b. Savings reported for 2010 – 2012 only for this activity
c. Savings from that year forward carry on indefinitely because replacement fixtures assumed to be as efficient due to current plumbing code and efficiency standards

28. Indoor Audits

a. Annual savings projections provided by SAWS (San Antonio Water System, 2016)
b. Savings reported for 2012 – 2013 only for this activity
c. Assumed 10-year useful life

29. Showerhead/Aerator Program

a. Annual savings projections provided by SAWS (San Antonio Water System, 2016)
b. Savings shown only through 2016
c. Savings from that year forward carry on indefinitely because replacement fixtures will be as efficient due to current plumbing code and efficiency standards
    i. Did not parse aerator savings from showerhead savings

30. Water Waste Citations

a. Annual savings projections provided by SAWS (San Antonio Water System, 2016)
b. Savings projected only through 2016
c. 3-year useful life applied to this activity by other utilities in broader TWDB study

5 Summary of Savings

Table 5-1. Savings for All Activities Not Including Water Loss Reduction (MG).

Year	Savings for Outdoor Activities	Savings for Indoor Activities	TOTAL ACTIVITY SAVINGS
2010	342.1	493.7	836
2011	765.5	931.9	1,697
2012	1,183.1	1,243.7	2,427
2013	1,182.7	1,814.1	2,997
2014	1,490.1	2,027.5	3,518
2015	1,820.7	2,102.5	3,923
2016	2,276.2	2,193.3	4,470
2017	2,426.6	2,193.4	4,620
2018	2,447.0	2,158.0	4,605

2022	1,874,450	18.00	1,437
2023	1,896,615	18.00	1,454
2024	1,918,780	18.00	1,471

6 Suggested Activities

Up to four activities were chosen as potential suggested activities for individual reports. These activities are: AMI system with customer portal, twice-per-week (or less) outdoor watering ordinances, strategic water rate increases, and rain barrels.

Activities were chosen because they are:

- Achievable
- Prevalence of vendors that can actually implement them
- Acceptability to city councils, MUD boards, et al.
- Easily adopted
- Cost effective
- Yield high savings relative to cost

AMI systems with customer engagement portals were also chosen because they represent a profusion of future applications that will undoubtedly continue to advance conservation efforts. AMI and meter data management (MDM) companies are developing new and innovative ways to benefit water providers, customers, and ultimately states that are pushing conservation and usage analytics further.

Each utility should be cognizant of the potential impact that these suggested activities may have on its own unique rate and revenue situation.

Benefits to consider:

- Avoided water supply and wastewater costs
    - o The higher water purchase, transmission, and distribution costs are, the greater the potential benefit realized when large amounts of water are conserved with these activities.
- Avoided system expansion costs

- Conserving water may allow a utility to postpone building new system capacity by decreasing demand even as population grows.

Costs to consider:

- Staff time and resources
- Unit cost per unit saved
- Implementation costs
- Stakeholder agreement and support
- Other overhead and budget considerations

6.1 Suggested Activities with Savings Estimates

1. Advanced Metering Infrastructure with Customer Engagement Portal

These portals, along with mobile applications and billing statements, can provide customers with much more access to their water use data in simple and compelling formats. This access and comparison with other customers' usage can reduce water use through changed behavior, as well as provide an opportunity for other conservation programs to be offered to the customer for increased adoption and additional savings. AMI systems support leak notification and web portals with real-time data. Any water loss reduction savings that these systems also yield were included in the water loss assessment of individual reports for this project.

- **a.** Specific utility results will vary based on portal features and frequency of customer notifications.
- **b.** Potential savings estimate assumes 20% of residential customers will use and save water due to the portal (Westin Engineering, 2015)
- **c.** Estimate assumes customers will save 10% of total annual use due to the portal
  - i. Savings estimate of 10% is an average of results from multiple studies (Chesnutt and Mitchell, 2013; East Bay Municipal Utility District, 2014; IBM, 2011; Texas A&M and Texas Water Resources Institute, 2016; Westin Engineering, 2015)
  - ii. An online search suggested that WaterSmart may already be working with SAWS.
  - iii. WaterSmart conservatively estimates savings of 5% for customers receiving its Home Water Reports (East Bay Municipal Utility District, 2014).
- **d.** Residential customers' use assumed to make up approximately 67% of all retail customers' use based on utility profile information submitted to the TWDB
  - i. This was the most common percentage of residential use among participating utilities in this project.
  - ii. Actual customer class demand percentages will vary by utility.
- **e.** 20% of residential customers saving 10% with this customer class breakdown amounts to 1.34% of total demand

f. Savings are assumed to increase along with demand as connections increase each year.[16]

g. See Table 6-1 for potential savings from this measure compared with the utility's WMS supply volumes targets.

Table 6-1. Current Savings + Potential Savings from AMI with Customer Portal (MG).

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Potential Savings from AMI with Customer Portal	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)

2034	2,044	1,631	3,675	1,323	2,993	0	2,993	2,006
2035	2,015	1,646	3,661	1,334	2,869	0	2,869	2,126
2036	1,846	1,661	3,507	1,345	2,745	0	2,745	2,108
2037	1,828	1,676	3,503	1,357	2,621	0	2,621	2,239
2038	1,818	1,690	3,508	1,368	2,497	0	2,497	2,379
2039	1,809	1,705	3,513	1,379	2,373	0	2,373	2,519
2040	1,799	1,720	3,519	1,390	2,249	0	2,249	2,660

[16] The 10% consumption reduction figure for 20% of residential customers is conservative, but savings could be greater when monitored yearly as customer engagement increases.

Statewide Water Conservation Quantification Project
City of San Marcos Report • 2017

1 Introduction

In Texas' 2017 State Water Plan, municipal water conservation is projected to meet 9.6 percent[1] of the state's future water needs by 2070. According to the 16 regional water plans that comprise the state water plan, this is expected to be achieved through a variety of measures such as installation of water efficient plumbing fixtures, water conservation pricing structures, water system audits, landscape irrigation ordinances, as well as other water conservation activities. The 9.6 percent is "in addition to the estimated share of future passive conservation savings from plumbing codes and water efficiency standards, which are embedded in municipal water demand projections" (Texas Water Development Board, 2017).

In 2015, the Texas Legislature appropriated funds to the Texas Water Development Board (TWDB) to fund a research project principally charged with quantitatively determining the savings of municipal water conservation activities being implemented in relation to the recommended conservation goals (supply volumes) in the State Water Plan. As part of the project, individual reports were completed for all participating utilities.

With this report, utilities will benefit by receiving a clear and concise picture of its water conservation goals alongside estimated savings from quantifiable activities. In the event that current activity savings may not be able to reach long-term goals, this report offers suggestions on how utilities can reach water conservation goals with activities that are effective, easily adopted, have widespread appeal, and are quantifiable.

2 Municipal Conservation Terminology and Review of Methodology Used by Regional Planners

To make use of the results of this study, it is important to understand several key terms used in the water planning process.

What is a water user group?

In this report, a water user group (WUG) refers to a retail water provider in the form a city, municipal utility district, water control and improvement district, special utility district, water supply corporation, fresh water supply district, or other type of water utility. The TWDB further defines WUGs as one of the following (Texas Water Development Board, 2016b):

- Cities and towns with a population of 500 or more
- Non-city utilities providing more than 280 acre-feet per year per year of water for municipal use
- Collective reporting units (CRUs) consisting of grouped utilities having a common association

[1] Equal to 811,224 acre-feet per year in conservation savings.

- County-Wide WUGs:
    - County-Other (Rural/unincorporated areas of municipal water use)
    - Manufacturing
    - Steam electric power generation

What is a recommended water management strategy?

A recommended water management strategy (WMS) is a measure that will help ensure WUGs have adequate water supplies for their end users well into the future. WMS examples include river diversions, groundwater use, reservoir and aquifer development, and irrigation conservation. When WMS is referred to in this report, it refers only to municipal conservation, which may include water loss reduction as a part of the same strategy.

What is a WMS supply volume?

A WMS supply volume is the amount of water that a given strategy is expected to yield each decade in the planning period if carried out by the WUG. In this report, a WMS supply volume is the amount of water recommended to come from municipal water conservation.

Some regional water plans separate this strategy's supply volume into a volume for municipal water conservation and a volume for water loss reduction for each decade. The total strategy supply volume is the sum of both. A regional water plan may also refer to "advanced conservation" as part of this strategy. Advanced conservation usually indicates that the volume could be achieved through a more robust mix of conservation activities described in the plan.

2.1 Regional Planning Group Approach to Determining Supply Volumes

Each regional water planning group (RWPG) is responsible for producing its own individual plan that, if executed, will provide sufficient water to its WUGs throughout a 50-year planning period. These plans are completed in five-year cycles, with the most recent edition being completed in 2016. The 2016 regional plans make up the 2017 State Water Plan, which sets out WMS supply volumes for the years 2020 through 2070.

The decadal WMS supply volumes for municipal conservation were established by each of the RWPGs in much the same manner. The RWPGs generally followed the guidelines of the Texas Legislature's Water Conservation Implementation Task Force on the pace utilities should target to reduce gallons per capita per day (GPCD)[2] consumption levels.

The targeted reductions used by most regions follow this formula:

- For municipal WUGs with water use of 140 GPCD and greater, the goal is to reduce per capita water use by one percent per year until the level of 140 GPCD is reached,

[2] Regional water planning GPCD is defined as the annual volume of water pumped, diverted, or purchased minus the volume exported (sold) to other water systems or large industrial facilities divided by the permanent resident population of the Municipal Water User Group in the regional water planning process divided by 365. Saline and reused/recycled water are not included in this volume (Texas Water Development Board, 2012).

after which, the goal is to reduce per capita water use by one-fourth percent per year for the remainder of the planning period (Texas Water Development Board, 2016j).

The yearly reductions in GPCD for a given WUG are then converted into recommended supply volumes in acre-feet per year for each decade as the reductions in consumption continue. Some regions reduce GPCD by slightly different percentages before and after the 140 GPCD threshold, some do not apply further reductions in GPCD for WUGs once they reach 140 GPCD, while others recommend only "advanced conservation" activities once WUGs meet 140 GPCD.

2.2 Methodology

In order to complete a uniform quantification process, the first engagement was with utilities that agreed to participate and collected as much relevant data as possible. These data included, among many others, historical GPCD consumption figures, advanced metering infrastructure (AMI) specifications, and detailed feedback on each conservation activity being implemented. Personal interviews focused on determining when and to what extent these activities were being employed, as well as assessing plans to continue such conservation. Examples of frequently implemented activities include tiered water rate conservation pricing, strategic water rate increases, outdoor irrigation audits and ordinances, and rain barrel distribution.

Subsequently, each utility's conservation activities were quantified through several different means, including evidence-based studies, utility field results and savings determinations, manufacturer guarantees, water loss audits, TWDB studies, and other information that assigned a savings value to the activity's implementation.

Every conservation activity studied and quantified has a gallons-per-year estimate, useful life, and decay rate (if applicable) associated with it. Some activities' savings are projected to grow as demand grows over time, while some savings are constant each year and subside once useful life has run its course. For expanded methodology and details on studies and formulas used to determine activity savings, refer to Section 6 of the State Report included as part of this document.

Once analyzed, the resulting savings estimates from each utility were compared with the recommended WMS supply volumes in its respective regional plan to determine if the savings met, exceeded, or fell short of those volumes. Individual utility savings were aggregated to compare with regional volumes, and regional savings were aggregated to compare with state volumes.

It is important to note that this report quantified activity savings—not including water loss reduction—for the WMS supply volume comparison dating back to 2012. The reason for this is, with a few exceptions, the regional planners used 2011 as the base year for establishing potential WMS supply volumes.[3] In addition, any conservation savings achieved through 2011 are assumed to be accounted for in the regional water planning GPCD for that year.[4] Thus, quantifying from 2012 and forward is the most accurate way to determine if utilities are meeting

[3] Confirmed via personal communication with Region C, H, K, and L Plan consultants.
[4] It was established with TWDB planning staff that 2011 GPCD levels were chosen because they represented the most current water use and conservation patterns at the time.

the recommended conservation volumes in the regional plans. This assumption is by no means 100 percent accurate, however. Some previously implemented activities' savings persist into future years beyond this starting point, while some activities' savings have ceased. One year's GPCD will not necessarily include all savings yielded by conservation activities that came before it, but the quantification assessment must have a starting point.

2.3 Quantifiable Savings

The key to the project being useful and reliable is that the results from year to year are measurable. Quantifying conservation activities that can be accurately measured provides greater certainty and better planning for all stakeholders.

While many utilities are engaged in a variety of conservation activities, not all can currently be properly measured. Some examples of these activities include education initiatives, website and social media engagement, and enforcement for water waste. That does not mean these measures are not essential. Education of consumers, for example, is a fundamental activity that makes all others effective, but little hard data exists to quantify the results of education alone.

In addition, the work of conservation coordinators can have a particularly significant effect on the savings of all other activities, but the specific savings attributed to that staff role is difficult to quantify.

3 Results

This report compares San Marcos' current water conservation activities and their quantified savings to two metrics: 1) Region L Water Plan's (Texas Water Development Board, 2016j) recommended WMS supply volumes for municipal conservation, and 2) San Marcos' own 5- and 10-year goals as established in its most recent water conservation plan submitted to the TWDB.

The WMS supply volumes for municipal water conservation are laid out by decade (2020 – 2070) in the regional water plans to serve as benchmarks for what each utility could achieve via that strategy during a 50-year planning period.[5]

The 5- and 10-year goals in San Marcos' most recent water conservation plan are established by the utility as realistic targets for reducing consumption over that timeframe. These reductions[6] are expressed in decreasing total GPCD [7] consumption and water loss GPCD.[8] [9]

The estimated savings in Tables 3-1 through 3-3 indicate the best information available as provided by utility staff. Some ongoing activities may not be known and are within a utility's service area are implemented on a micro-scale that may not be quantified. Individual households

[5] Some regional water plans separate this strategy volume into a volume for water conservation and a volume for water loss reduction for each decade. The total strategy volume is the sum of both.

[6] Occasionally, some utilities expect consumption to increase due to various reasons, such as an incoming industrial presence expected to raise consumption figures for the entire service area.

[7] As defined in TWDB water conservation annual reports: (Total Gallons in System ÷ Permanent Population) ÷ 365

[8] These plans also have targets for residential GPCD and water loss as a percentage (rather than GPCD), but this report does not address those goals.

[9] As defined in annual TWDB water loss audits: (Total Water Loss ÷ Permanent Population) ÷ 365

and businesses may be implementing conservation measures that are unknown and therefore cannot be included in the report.

Explanation of approach to assessing water loss reduction savings

Water loss reduction savings are defined as the volume of water participating utilities are realizing from their water loss mitigation efforts. For this report, this value is the difference between each individual utility's baseline[10] for water loss GPCD and its most recent water loss GPCD reported in 2015 water loss audits on file with TWDB. Savings from all water loss reduction efforts—including pipe replacements and leak repair—are assumed to be included in this comparison to a utility's baseline.

Note that because a single year (2015) value was used for comparison, it is possible that the 2015 value could be anomalous due to a number of events that may have occurred that year, such as a water main break, a particularly wet year, or a robust effort by the utility to curtail water loss. This will distort future savings figures that were carried forward in the study because water loss will inevitably increase or decrease in later years.

Ideally, using a rolling five-year average in the calculation would correct such anomalies. However, there was insufficient data to do that for every utility. The approach was to use the most complete water loss data possible, which was represented by the 2015 water loss audit. This problem will be further minimized, as continued data collection will allow five-year averages to be calculated for a majority of utilities.

In this way, water loss savings estimates are different from all other activity savings estimates in the project. Whether savings were positive or negative depended on where individual utilities established their own baselines or where their five-year average started, and what water loss GPCD value was reported in 2015.

3.1 Current Savings Compared to Conservation WMS Supply Volume (in million gallons) in Regional Water Plan

Table 3-1 shows the 2070 outlook for San Marcos with the utility's yearly recommended WMS supply volume in million gallons (MG) alongside its water savings from implemented activities, including from water loss reduction. These activities and their associated savings are covered in greater detail in Sections 4 and 5.

Starting in 2015, this table compares all quantified conservation activity and the recommended conservation WMS supply volume for the planning period. The following definitions pair with the column headers in Table 3-1.

<u>Actual Current Conservation Activity Savings</u> – All quantified activities currently being performed by the utility, *excluding* savings from water loss reduction. The regional planners used 2011 GPCD as the baseline for determining future conservation WMS supply volumes, therefore the study quantifies utility savings starting in 2012 for this comparison. The summary of these

[10] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.

savings can be referenced in Table 5-1.

Actual Water Loss Reduction Savings (as of 2015) – The difference between the baseline[11] for water loss GPCD and most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB. [12] The summary of these savings can be referenced in Table 5-2.

Total Savings from All Conservation Activity – Actual Current Conservation Activity Savings plus Actual Water Loss Reduction Savings (as of 2015).

Conservation WMS Volume – The recommended municipal water conservation supply volume in the regional plan for the decades ranging from 2020 to 2070. These volumes are converted to MG from the values listed in the plan in acre-feet and then calculated in annual increments.

Water Loss Reduction WMS Volume – Some regional water plans have a separate WMS volume for water conservation and for water loss reduction for each decade. If a WUG's regional plan has a WMS volume for water loss reduction, this column will have values other than zero.

Total Yearly WMS Volume – The sum of the Conservation WMS Volume and Water Loss Reduction WMS Volume.

Over (Short) – The amount that the utility's Total Savings from All Conservation Activity (since 2012), is over or below the Total Yearly WMS Volume in the regional water plan. If the amount falls below the WMS volume, it will appear in parentheses.

[11] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.

[12] If water loss GPCD has increased from the utility's baseline or historic five-year average to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount.

Table 3-1. Current Savings Compared to Conservation WMS Supply Volume (MG) in Regional Water Plan.

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)
2015	48	111	159	26	0	26	133

3.2 Utility Water Conservation Plan Goals – Total GPCD

Table 3-2 shows how San Marcos' quantified savings from its implemented activities compare with 5- and 10-year goals established in its individual water conservation plan submitted to the TWDB. The following definitions pair with the column headers in Table 3-2.

Utility Population – Estimated utility service area population for the years indicated.

Total GPCD Goals – Total GPCD goals start with the utility's baseline[13] for total GPCD and progress in subsequent years to match five- and 10-year goals indicated in a utility's five-year water conservation plan on file with the TWDB. The first five annual GPCD goals were developed by spreading the difference between the baseline and five-year goal evenly over five years. The second five annual GPCD goals spread the difference between the five-year goal and 10-year goal evenly over the next five years.

Annual Savings Goal with Reduction in GPCD (MG) – This column shows what reductions from the baseline GPCD would yield in terms of volume each year as more water is saved. The volumes indicated here are what target GPCD goals look like expressed in million gallons. Annual volumes were derived using the formula: (baseline total GPCD – target total GPCD for that year) x 365 days ÷ 1,000,000 gallons.

Total Savings for All Current Quantified Activities (MG) – Total quantified savings for all current conservation activities and savings from water loss reduction. Refer to Tables 5-1 and 5-2 for details on these savings.

Over (Short) – The amount that the utility's total quantified savings for all current conservation activities (since 2012), including water loss reduction, is over or below the volume represented by reductions in GPCD each year. If the quantified savings are less than these target volumes, the value will appear in parentheses.

Table 3-2. Utility Water Conservation Plan Goals — Total GPCD.

Year #	Year	Utility Population	Total GPCD Goals	Annual Savings Goal with Reduction in GPCD (MG)	Total Savings for All Current Quantified Activities (MG)	Over (Short) (MG)
0	**Baseline**	-	122	0	0	0
1	2015	60,684	121	27	159	132
2	2016	62,771	120	55	200	145
3	2017	64,857	118	85	205	120
4	2018	66,944	117	117	210	93
5-year Goal	2019	69,030	116	151	215	64
6	2020	71,117	116	166	220	54
7	2021	72,487	115	180	224	44
8	2022	73,857	115	194	228	34
9	2023	75,227	114	209	231	23
10-year Goal	2024	76,597	114	224	235	11

[13] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for total GPCD from the utility's most recently submitted five-year water conservation plan was used.

3.3 Utility Water Conservation Plan Goals – Water Loss GPCD

Table 3-3 shows how San Marcos' most recent water loss audit compares with five- and 10-year water loss goals in its water conservation plan. The following definitions pair with the column headers in Table 3-2.

Utility Population – Estimated utility service area population for the years indicated.

Water Loss GPCD Goals – Water loss GPCD goals start with the utility's baseline[14] for water loss GPCD and progress in subsequent years to match 5- and 10-year water loss goals indicated in a utility's five-year water conservation plan on file with the TWDB. The first five annual GPCD goals were developed by spreading the difference between the baseline and five-year goal evenly over five years. The second five annual GPCD goals spread the difference between the five-year goal and 10-year goal evenly over the next five years.

Yearly Savings Goal with Reduction in GPCD (MG) – This column shows what reductions from the baseline water loss GPCD would yield in terms of volume each year as more water is saved. The volumes indicated here are what target water loss GPCD goals look like expressed in million gallons. Annual volumes were derived using the formula: (baseline water loss GPCD – target water loss GPCD for that year) x 365 days ÷ 1,000,000 gallons.

Total Savings from Water Loss Reduction (MG) – The difference between a utility's established baseline for water loss GPCD and the most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB. If water loss GPCD has increased from the utility's baseline to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount. Reference Table 5-2 for savings from water loss reduction.

Over (Short) – The amount that the utility's total savings from water loss reduction is over or below the volume represented by reductions in GPCD each year. If water loss reduction savings are less than these target volumes, the value will appear in parentheses.

Table 3-3. Utility Water Conservation Plan Goals — Water Loss GPCD.

Year #	Year	Utility Population	Water Loss GPCD Goals	Yearly Savings Goal with Reduction in GPCD (MG)	Total Savings from Water Loss Reduction (MG)	Over (Short) (MG)
0	**Baseline**	-	24	0	0	0
1	2,015	60,684	22	44	115	70
2	2,016	62,771	20	92	118	27
3	2,017	64,857	18	142	122	(20)
4	2,018	66,944	16	195	126	(69)
5-year Goal	2,019	69,030	14	252	130	(122)
6	2,020	71,117	14	260	132	(127)
7	2,021	72,487	14	265	135	(130)
8	2,022	73,857	14	270	137	(132)
9	2,023	75,227	14	275	140	(135)
10-year Goal	2,024	76,597	14	280	142	(137)

[14] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.

4 Implemented Activities

Below is a list of completed activities with estimated water savings. Note that drought response and other measures are not included in the utility's water savings because they are temporary, awareness-based or not able to be accurately quantified on an annual basis.

These are not savings projections of potential future activities. Estimated savings are based on measures that have actually been implemented. If savings are shown to persist in future years, it is because the measure is permanent, such as an ordinance, or the savings are assumed to continue for the reason listed under the itemized activity. Estimated savings from water rate increases are the one exception to these conditions.

Water Rate Increases

Savings from water rate increases were included because entities such as the U.S. Environmental Protection Agency and others indicate specific savings for utilities that raise rates (Texas Water Development Board, 2013; U.S. E.P.A., 1998; Whitcomb, 1999). This project includes surveys of several utilities that have minimal education efforts, perform no other substantive conservation activities, and yet experienced significant demand reduction that coincided with rate increases. In those cases, savings estimates matched up closely with decreases in total GPCD. For many smaller utilities, especially those with customers lacking disposable income, this measure is the only tool used to conserve other than water loss reduction.

The following assumptions were made for water rate increases:

- The model assumes that savings persist into future years because it is expected that the utility will continue to make periodic rate increases in line with the percentage increases from previous years.
- Only the last two rate increases for a utility were quantified.
- Savings grow with demand because as new customers enter the service area, they are assumed to adhere to the same price elasticity model estimates.
- A weighted average for savings was used when rate increases differed between residential and industrial-commercial-institutional (ICI) customers based on the individual utility's customer class breakdown.
- When a utility raised rates using tiered rate conservation pricing, a 50/50 savings split was used when increases differed between base and volumetric rates.
    - The reasoning is that all customers must react to the base increase, yet the pricing signal is stronger when volumetric rate increases affect the higher usage customers.
    - The 50/50 split is reasonable because many customers will not reach the higher volumetric tiers.
    - Studies show that most customers do not actually know they have reached the higher volumetric tiers; just that their bill has increased (Texas Water Development Board, 2013).

4.1 Itemized Activities

1. **Utility Website**
    a. Easy-to-use website with conservation tips and water rates
    b. Features contact information for Public Works staff and customer service

2. **Continuing Public Education**
    a. The utility engages the public in many ways including:
        i. Brochures, bill messages, displays, and exhibits

3. **Water Loss Reduction Savings**[15]
    a. Savings of 111 MG annually in 2015
    b. Water loss reduction savings = the difference between a utility's baseline[16] water loss GPCD submitted in its most recent 5-year water conservation plan and its most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB
    c. If water loss GPCD has increased from the utility's baseline or historic 5-year average to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount.
    d. All savings estimates grow each year at the same rate population figures for the utility grow in the regional water plan.

4. **Water Rate Increases**
    a. Last rate increases:[17]
        i. 5.0% increase in 2015
        ii. 5.0% increase in 2016
    b. Estimated customer demand reduction of 1.0%
    c. Savings is cumulative and based on more than one source[18] (U.S. EPA, 1998; Whitcomb, 1999)
    d. Savings from rate increases are shown to persist over time, however, note that savings from these pricing signals will likely decrease if rates remain the same in future years.

5. **Automatic Meter Reading (AMR)/Advanced Metering Infrastructure (AMI)**
    a. These metering systems can save water in a number of ways, including from water loss reduction through improved leak detection.
    b. All water loss reduction savings associated with this activity are detailed in Section 5, which assessed utility baseline water loss GPCD and most recently reported water loss GPCD to determine water savings.

[15] If current water loss levels exceed a utility's baseline, this value is treated as a deduction from total quantified savings.
[16] In the absence of having a baseline figure provided in the utility's most recently submitted 5-year water conservation plan, the historic 5-year average for water loss GPCD in the plan was used.
[17] Correspondence with utility staff.
[18] The study estimates a 2% demand reduction with 10% increase in price on a targeted customer class. By applying a ratio, it is possible to determine the savings for lower or higher percentage increases

c. For estimated water savings that could be increased by implementing meter data management (MDM) and customer engagement portal applications, refer to Section 6 of this report.
    i. With these additional applications, water savings can be achieved through changed customer behavior and other real-time actions that go beyond water loss reduction.

6. **Rain Barrels**
    a. 69,363 gallons of capacity rebated from 2010 – 2016
    b. In Region L, estimated savings of 17 gallons per year per gallon of capacity rebated, sold, or distributed (GDS Associates, 2002).
    c. Estimated 10-year useful life for most barrels

7. **Outdoor Landscape Evaluations (SF)**
    a. 64 outdoor evaluations performed since 2013
    b. Estimated 8,000 gallons per year for each system evaluation (A&N Technical Services, 2005)
        i. Assumed 65% savings from typical indoor and outdoor survey when only outdoor watering is evaluated (Whitcomb, 2000)
    c. Approximately 22 gallons per day
    d. Greater savings during peak periods
    e. Lesser savings during off-peak periods
    f. 20% decay rate per year attributed to customer behavior (A&N Technical Services, 2005)

8. **High Efficiency (HE) Toilet Replacement Program (SF)**
    a. 249 toilets replaced from 2010 – 2016
        i. Only quantified for these years
    b. Estimated 10,390 gallons per year per toilet (A&N Technical Services, 2005)
    c. Savings carry on indefinitely because replacement toilet will be as efficient

9. **HE Toilet Replacement (MF)**
    a. 371 toilets replaced from 2010 – 2016
    b. Estimated 15,756 gallons per year per toilet (A&N Technical Services, 2005)
    c. Savings carry on indefinitely because replacement toilet will be as efficient

10. **Tank-type HE Toilet Replacement (ICI)**
    a. 169 toilets replaced from 2010 – 2016
    b. Estimated 13,000 gallons per year per toilet (A&N Technical Services, 2005)
    c. Rebates per year provided by staff
    d. Savings carry on indefinitely because replacement toilet will be as efficient

11. **Clotheswasher Replacement Program (SF)**
    a. 125 rebates issued from 2010 – 2016
    b. Rebates per year provided by staff

c. Estimated 7,030 gallons per year per washer (A&N Technical Services, 2005; THELMA, 1997)
d. 11-year useful life
e. Savings carry on indefinitely because replacement washer will be as efficient due to plumbing code and efficiency standards

12. Additional Activities Not Quantified:

a. More stringent construction standards for new car washes, cooling systems, water features, dining facilities, laundry facilities, and irrigation systems

5 Summary of Savings

Table 5-1. Savings by Water Conservation Activity (MG).

Year	Water Rate Increases	Rain Barrels	Tank-type HE Toilets (ICI)	Outdoor Landscape Evaluations (SF)	HE Toilets (SF)	HE Toilets (MF)	HE Clothes Washer Rebates (SF)	TOTAL SAVINGS
2009								0.0
2010		0.1	0.8		0.7	4.3	0.1	6.0
2011		0.2	0.8		1.2	4.3	0.3	6.7

Table 5-2. Savings from Water Loss Reduction (MG).

Year	Utility Population	Water Loss GPCD	Total Savings from Water Loss Reduction
Baseline	-	24.00	0
2015	60,684	19.00	111
2016	62,771	19.00	115
2017	64,857	19.00	118
2018	66,944	19.00	122
2019	69,030	19.00	126
2020	71,117	19.00	130
2021	72,487	19.00	132
2022	73,857	19.00	135
2023	75,227	19.00	137
2024	76,597	19.00	140

6 Suggested Activities

Up to four activities were chosen as potential suggested activities for individual reports. These activities are: AMI system with customer portal, twice-per-week (or less) outdoor watering ordinances, strategic water rate increases, and rain barrels.

Activities were chosen because they are:

- Achievable
- Prevalence of vendors that can actually implement them
- Acceptability to city councils, MUD boards, et al.
- Easily adopted
- Cost effective
- Yield high savings relative to cost

AMI systems with customer engagement portals were also chosen because they represent a profusion of future applications that will undoubtedly continue to advance conservation efforts. AMI and meter data management (MDM) companies are developing new and innovative ways to benefit water providers, customers, and ultimately states that are pushing conservation and usage analytics further.

Each utility should be cognizant of the potential impact that these suggested activities may have on its own unique rate and revenue situation.

Benefits to consider:

- Avoided water supply and wastewater costs
    - The higher water purchase, transmission, and distribution costs are, the greater the potential benefit realized when large amounts of water are conserved with these activities.
- Avoided system expansion costs

- Conserving water may allow a utility to postpone building new system capacity by decreasing demand even as population grows.

Costs to consider:

- Staff time and resources
- Unit cost per unit saved
- Implementation costs
- Stakeholder agreement and support
- Other overhead and budget considerations

6.1 Suggested Activities with Savings Estimates

1. Twice-a-week Outdoor Watering Restriction Ordinance
   a. Potentially 5.47% savings of total demand (Hermitte and Mace, 2012; Sierra Club-Lone Star Chapter and National Wildlife Federation, 2015)
   b. Savings could be 198 MG per year with current demand.
   c. See Table 6-1 for potential savings from this measure compared with the city's WMS supply volumes targets.

Table 6-1. Current Savings + Potential Savings from 2x per Week Watering Ordinance (MG).

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Potential Savings from Ordinance	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)

2040	119	185	303	293	366	0	366	231

2. Advanced Metering Infrastructure with Customer Engagement Portal

These portals, along with mobile applications and billing statements, can provide customers with much more access to their water use data in simple and compelling formats. This access and comparison with other customers' usage can reduce water use through changed behavior, as well as provide an opportunity for other conservation programs to be offered to the customer for increased adoption and additional savings. AMI systems support leak notification and web portals with real-time data. Any water loss reduction savings that these systems also yield were included in the water loss assessment of individual reports for this project.

- **a.** Specific utility results will vary based on portal features and frequency of customer notifications
- **b.** Potential savings estimate assumes 20% of residential customers will use and save water due to the portal (Westin Engineering, 2015)
- **c.** Estimate assumes customers will save 10% of total annual use due to the portal
    - i. Savings estimate of 10% is an average of results from multiple studies (Chesnutt and Mitchell, 2013; East Bay Municipal Utility District, 2014; IBM, 2011; Texas A&M and Texas Water Resources Institute, 2016; Westin Engineering, 2015)
- **d.** Residential customers' use assumed to make up approximately 67% of all retail customers' use based on utility profile information submitted to the TWDB
    - i. This was the most common percentage of residential use among participating utilities in this project.
    - ii. Actual customer class demand percentages will vary by utility.
- **e.** 20% of residential customers saving 10% with this customer class breakdown amounts to 1.34% of total demand
- **f.** Savings are assumed to increase along with demand as connections increase each year[19]
- **g.** See Table 6-2 for potential savings from this measure compared with the utility's WMS supply volumes targets.

[19] The 10% consumption reduction figure for 20% of residential customers is conservative, but savings could be greater when monitored yearly as customer engagement increases.

Table 6-2. Current Savings + Potential Savings from AMI with Customer Portal (MG).

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Potential Savings from AMI from Customer Portal	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)

Statewide Water Conservation Quantification Project
Universal City Report • 2017

1 Introduction

In Texas' 2017 State Water Plan, municipal water conservation is projected to meet 9.6 percent[1] of the state's future water needs by 2070. According to the 16 regional water plans that comprise the state water plan, this is expected to be achieved through a variety of measures such as installation of water efficient plumbing fixtures, water conservation pricing structures, water system audits, landscape irrigation ordinances, as well as other water conservation activities. The 9.6 percent is "in addition to the estimated share of future passive conservation savings from plumbing codes and water efficiency standards, which are embedded in municipal water demand projections" (Texas Water Development Board, 2017).

In 2015, the Texas Legislature appropriated funds to the Texas Water Development Board (TWDB) to fund a research project principally charged with quantitatively determining the savings of municipal water conservation activities being implemented in relation to the recommended conservation goals (supply volumes) in the State Water Plan. As part of the project, individual reports were completed for all participating utilities.

With this report, utilities will benefit by receiving a clear and concise picture of its water conservation goals alongside estimated savings from quantifiable activities. In the event that current activity savings may not be able to reach long-term goals, this report offers suggestions on how utilities can reach water conservation goals with activities that are effective, easily adopted, have widespread appeal, and are quantifiable.

2 Municipal Conservation Terminology and Review of Methodology Used by Regional Planners

To make use of the results of this study, it is important to understand several key terms used in the water planning process.

What is a water user group?

In this report, a water user group (WUG) refers to a retail water provider in the form a city, municipal utility district, water control and improvement district, special utility district, water supply corporation, fresh water supply district, or other type of water utility. The TWDB further defines WUGs as one of the following (Texas Water Development Board, 2016b):

- Cities and towns with a population of 500 or more
- Non-city utilities providing more than 280 acre-feet per year per year of water for municipal use
- Collective reporting units (CRUs) consisting of grouped utilities having a common association

[1] Equal to 811,224 acre-feet per year in conservation savings.

- County-Wide WUGs:
  - County-Other (Rural/unincorporated areas of municipal water use)
  - Manufacturing
  - Steam electric power generation

What is a recommended water management strategy?

A recommended water management strategy (WMS) is a measure that will help ensure WUGs have adequate water supplies for their end users well into the future. WMS examples include river diversions, groundwater use, reservoir and aquifer development, and irrigation conservation. When WMS is referred to in this report, it refers only to municipal conservation, which may include water loss reduction as a part of the same strategy.

What is a WMS supply volume?

A WMS supply volume is the amount of water that a given strategy is expected to yield each decade in the planning period if carried out by the WUG. In this report, a WMS supply volume is the amount of water recommended to come from municipal water conservation.

Some regional water plans separate this strategy's supply volume into a volume for municipal water conservation and a volume for water loss reduction for each decade. The total strategy supply volume is the sum of both. A regional water plan may also refer to "advanced conservation" as part of this strategy. Advanced conservation usually indicates that the volume could be achieved through a more robust mix of conservation activities described in the plan.

2.1 Regional Planning Group Approach to Determining Supply Volumes

Each regional water planning group (RWPG) is responsible for producing its own individual plan that, if executed, will provide sufficient water to its WUGs throughout a 50-year planning period. These plans are completed in five-year cycles, with the most recent edition being completed in 2016. The 2016 regional plans make up the 2017 State Water Plan, which sets out WMS supply volumes for the years 2020 through 2070.

The decadal WMS supply volumes for municipal conservation were established by each of the RWPGs in much the same manner. The RWPGs generally followed the guidelines of the Texas Legislature's Water Conservation Implementation Task Force on the pace utilities should target to reduce gallons per capita per day (GPCD)[2] consumption levels.

The targeted reductions used by most regions follow this formula:

- For municipal WUGs with water use of 140 GPCD and greater, the goal is to reduce per capita water use by one percent per year until the level of 140 GPCD is reached,

[2] Regional water planning GPCD is defined as the annual volume of water pumped, diverted, or purchased minus the volume exported (sold) to other water systems or large industrial facilities divided by the permanent resident population of the Municipal Water User Group in the regional water planning process divided by 365. Saline and reused/recycled water are not included in this volume (Texas Water Development Board, 2012).

after which, the goal is to reduce per capita water use by one-fourth percent per year for the remainder of the planning period (Texas Water Development Board, 2015j).

The yearly reductions in GPCD for a given WUG are then converted into recommended supply volumes in acre-feet per year for each decade as the reductions in consumption continue. Some regions reduce GPCD by slightly different percentages before and after the 140 GPCD threshold, some do not apply further reductions in GPCD for WUGs once they reach 140 GPCD, while others recommend only "advanced conservation" activities once WUGs meet 140 GPCD.

2.2 Methodology

In order to complete a uniform quantification process, the first engagement was with utilities that agreed to participate and collected as much relevant data as possible. These data included, among many others, historical GPCD consumption figures, advanced metering infrastructure (AMI) specifications, and detailed feedback on each conservation activity being implemented. Personal interviews focused on determining when and to what extent these activities were being employed, as well as assessing plans to continue such conservation. Examples of frequently implemented activities include tiered water rate conservation pricing, strategic water rate increases, outdoor irrigation audits and ordinances, and rain barrel distribution.

Subsequently, each utility's conservation activities were quantified through several different means, including evidence-based studies, utility field results and savings determinations, manufacturer guarantees, water loss audits, TWDB studies, and other information that assigned a savings value to the activity's implementation.

Every conservation activity studied and quantified has a gallons-per-year estimate, useful life, and decay rate (if applicable) associated with it. Some activities' savings are projected to grow as demand grows over time, while some savings are constant each year and subside once useful life has run its course. For expanded methodology and details on studies and formulas used to determine activity savings, refer to Section 6 of the State Report included as part of this document.

Once analyzed, the resulting savings estimates from each utility were compared with the recommended WMS supply volumes in its respective regional plan to determine if the savings met, exceeded, or fell short of those volumes. Individual utility savings were aggregated to compare with regional volumes, and regional savings were aggregated to compare with state volumes.

It is important to note that this report quantified activity savings—not including water loss reduction—for the WMS supply volume comparison dating back to 2012. The reason for this is, with a few exceptions, the regional planners used 2011 as the base year for establishing potential WMS supply volumes.[3] In addition, any conservation savings achieved through 2011 are assumed to be accounted for in the regional water planning GPCD for that year.[4] Thus, quantifying from 2012 and forward is the most accurate way to determine if utilities are meeting

[3] Confirmed via personal communication with Region C, H, K, and L Plan consultants.
[4] It was established with TWDB planning staff that 2011 GPCD levels were chosen because they represented the most current water use and conservation patterns at the time.

the recommended conservation volumes in the regional plans. This assumption is by no means 100 percent accurate, however. Some previously implemented activities' savings persist into future years beyond this starting point, while some activities' savings have ceased. One year's GPCD will not necessarily include all savings yielded by conservation activities that came before it, but the quantification assessment must have a starting point.

2.3 Quantifiable Savings

The key to the project being useful and reliable is that the results from year to year are measurable. Quantifying conservation activities that can be accurately measured provides greater certainty and better planning for all stakeholders.

While many utilities are engaged in a variety of conservation activities, not all can currently be properly measured. Some examples of these activities include education initiatives, website and social media engagement, and enforcement for water waste. That does not mean these measures are not essential. Education of consumers, for example, is a fundamental activity that makes all others effective, but little hard data exists to quantify the results of education alone.

In addition, the work of conservation coordinators can have a particularly significant effect on the savings of all other activities, but the specific savings attributed to that staff role is difficult to quantify.

3 Results

This report compares Universal City's current water conservation activities and their quantified savings to two metrics: 1) Region L Water Plan's (Texas Water Development Board, 2016j) recommended WMS supply volumes for municipal conservation, and 2) Universal City's own 5- and 10-year goals as established in its most recent water conservation plan submitted to the TWDB.

The WMS supply volumes for municipal water conservation are laid out by decade (2020 – 2070) in the regional water plans to serve as benchmarks for what each utility could achieve via that strategy during a 50-year planning period.[5]

The 5- and 10-year goals in Universal City's most recent water conservation plan are established by the utility as realistic targets for reducing consumption over that timeframe. These reductions[6] are expressed in decreasing total GPCD [7] consumption and water loss GPCD.[8] [9]

The estimated savings in Tables 3-1 through 3-3 indicate the best information available as provided by utility staff. Some ongoing activities may not be known and are within a utility's

[5] Some regional water plans separate this strategy volume into a volume for water conservation and a volume for water loss reduction for each decade. The total strategy volume is the sum of both.
[6] Occasionally, some utilities expect consumption to increase due to various reasons, such as an incoming industrial presence expected to raise consumption figures for the entire service area.
[7] As defined in TWDB water conservation annual reports: (Total Gallons in System ÷ Permanent Population) ÷ 365
[8] These plans also have targets for residential GPCD and water loss as a percentage (rather than GPCD), but this report does not address those goals.
[9] As defined in annual TWDB water loss audits: (Total Water Loss ÷ Permanent Population) ÷ 365

service area are implemented on a micro-scale that may not be quantified. Individual households and businesses may be implementing conservation measures that are unknown and therefore cannot be included in the report.

Explanation of approach to assessing water loss reduction savings

Water loss reduction savings are defined as the volume of water participating utilities are realizing from their water loss mitigation efforts. For this report, this value is the difference between each individual utility's baseline[10] for water loss GPCD and its most recent water loss GPCD reported in 2015 water loss audits on file with TWDB. Savings from all water loss reduction efforts—including pipe replacements and leak repair—are assumed to be included in this comparison to a utility's baseline.

Note that because a single year (2015) value was used for comparison, it is possible that the 2015 value could be anomalous due to a number of events that may have occurred that year, such as a water main break, a particularly wet year, or a robust effort by the utility to curtail water loss. This will distort future savings figures that were carried forward in the study because water loss will inevitably increase or decrease in later years.

Ideally, using a rolling five-year average in the calculation would correct such anomalies. However, there was insufficient data to do that for every utility. The approach was to use the most complete water loss data possible, which was represented by the 2015 water loss audit. This problem will be further minimized, as continued data collection will allow five-year averages to be calculated for a majority of utilities.

In this way, water loss savings estimates are different from all other activity savings estimates in the project. Whether savings were positive or negative depended on where individual utilities established their own baselines or where their five-year average started, and what water loss GPCD value was reported in 2015.

3.1 Current Savings Compared to Conservation WMS Supply Volume (in million gallons) in Regional Water Plan

Table 3-1 shows the 2070 outlook for Universal City with the utility's yearly recommended WMS supply volume in million gallons (MG) alongside its water savings from implemented activities, including from water loss reduction. These activities and their associated savings are covered in greater detail in Sections 4 and 5.

Starting in 2015, this table compares all quantified conservation activity and the recommended conservation WMS supply volume for the planning period. The following definitions pair with the column headers in Table 3-1.

Actual Current Conservation Activity Savings – All quantified activities currently being performed by the utility, *excluding* savings from water loss reduction. The regional planners used 2011 GPCD as the baseline for determining future conservation WMS supply volumes, therefore

[10] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.

the study quantifies utility savings starting in 2012 for this comparison. The summary of these savings can be referenced in Table 5-1.

Actual Water Loss Reduction Savings (as of 2015) – The difference between the baseline[11] for water loss GPCD and most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB. [12] The summary of these savings can be referenced in Table 5-2.

Total Savings from All Conservation Activity – Actual Current Conservation Activity Savings plus Actual Water Loss Reduction Savings (as of 2015).

Conservation WMS Volume – The recommended municipal water conservation supply volume in the regional plan for the decades ranging from 2020 to 2070. These volumes are converted to MG from the values listed in the plan in acre-feet and then calculated in annual increments.

Water Loss Reduction WMS Volume – Some regional water plans have a separate WMS volume for water conservation and for water loss reduction for each decade. If a WUG's regional plan has a WMS volume for water loss reduction, this column will have values other than zero.

Total Yearly WMS Volume – The sum of the Conservation WMS Volume and Water Loss Reduction WMS Volume.

Over (Short) – The amount that the utility's Total Savings from All Conservation Activity (since 2012), is over or below the Total Yearly WMS Volume in the regional water plan. If the amount falls below the WMS volume, it will appear in parentheses.

[11] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.
[12] If water loss GPCD has increased from the utility's baseline or historic five-year average to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount.

Table 3-1. Current Savings Compared to Conservation WMS Supply Volume (MG) in Regional Water Plan.

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)

3.2 Utility Water Conservation Plan Goals – Total GPCD

Table 3-2 shows how Universal City's quantified savings from its implemented activities compare with 5- and 10-year goals established in its individual water conservation plan submitted to the TWDB. The following definitions pair with the column headers in Table 3-2.

Utility Population – Estimated utility service area population for the years indicated.

Total GPCD Goals – Total GPCD goals start with the utility's baseline[13] for total GPCD and progress in subsequent years to match 5- and 10-year goals indicated in a utility's five-year water conservation plan on file with the TWDB. The first five annual GPCD goals were developed by spreading the difference between the baseline and five-year goal evenly over five years. The second five annual GPCD goals spread the difference between the five-year goal and 10-year goal evenly over the next five years.

Annual Savings Goal with Reduction in GPCD (MG) – This column shows what reductions from the baseline GPCD would yield in terms of volume each year as more water is saved. The volumes indicated here are what target GPCD goals look like expressed in million gallons. Annual volumes were derived using the formula: (baseline total GPCD – target total GPCD for that year) x 365 days ÷ 1,000,000 gallons.

Total Savings for All Current Quantified Activities (MG) – Total quantified savings for all current conservation activities and savings from water loss reduction. Refer to Tables 5-1 and 5-2 for details on these savings.

Over (Short) – The amount that the utility's total quantified savings for all current conservation activities (since 2012), including water loss reduction, is over or below the volume represented by reductions in GPCD each year. If the quantified savings are less than these target volumes, the value will appear in parentheses.

Table 3-2. Utility Water Conservation Plan Goals — Total GPCD.

Year #	Year	Utility Population	Total GPCD Goals	Annual Savings Goal with Reduction in GPCD (MG)	Total Savings for All Current Quantified Activities (MG)	Over (Short) (MG)
0	**Baseline**	-	136	0	0	0
1	2015	19,986	135	10	64	54
2	2016	20,255	133	21	73	53
3	2017	20,524	132	31	74	42
4	2018	20,794	130	43	75	32
5-year Goal	2019	21,063	129	54	75	21
6	2020	21,332	128	64	76	12
7	2021	21,396	127	73	76	2
8	2022	21,460	125	83	76	-7
9	2023	21,523	124	93	76	-17
10-year Goal	2024	21,587	123	102	76	-26

[13] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for total GPCD from the utility's most recently submitted five-year water conservation plan was used.

3.3 Utility Water Conservation Plan Goals – Water Loss GPCD

Table 3-3 shows how Universal City's most recent water loss audit compares with five- and 10-year water loss goals in its water conservation plan. The following definitions pair with the column headers in Table 3-2.

Utility Population – Estimated utility service area population for the years indicated.

Water Loss GPCD Goals – Water loss GPCD goals start with the utility's baseline[14] for water loss GPCD and progress in subsequent years to match 5- and 10-year water loss goals indicated in a utility's five-year water conservation plan on file with the TWDB. The first five annual GPCD goals were developed by spreading the difference between the baseline and five-year goal evenly over five years. The second five annual GPCD goals spread the difference between the five-year goal and 10-year goal evenly over the next five years.

Yearly Savings Goal with Reduction in GPCD (MG) – This column shows what reductions from the baseline water loss GPCD would yield in terms of volume each year as more water is saved. The volumes indicated here are what target water loss GPCD goals look like expressed in million gallons. Annual volumes were derived using the formula: (baseline water loss GPCD – target water loss GPCD for that year) x 365 days ÷ 1,000,000 gallons.

Total Savings from Water Loss Reduction (MG) – The difference between a utility's established baseline for water loss GPCD and the most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB. If water loss GPCD has increased from the utility's baseline to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount. Reference Table 5-2 for savings from water loss reduction.

Over (Short) – The amount that the utility's total savings from water loss reduction is over or below the volume represented by reductions in GPCD each year. If water loss reduction savings are less than these target volumes, the value will appear in parentheses.

Table 3-3. Utility Water Conservation Plan Goals — Water Loss GPCD.

Year #	Year	Utility Population	Water Loss GPCD Goals	Yearly Savings Goal with Reduction in GPCD (MG)	Total Savings from Water Loss Reduction (MG)	Over (Short) (MG)
0	**Baseline**	-	9.00	0	0	0
1	2015	19,986	8.80	1	44	42
2	2016	20,255	8.60	3	44	41
3	2017	20,524	8.40	4	45	40
4	2018	20,794	8.20	6	46	39
5-year Goal	2019	21,063	8.00	8	46	38
6	2020	21,332	7.80	9	47	37
7	2021	21,396	7.60	11	47	36
8	2022	21,460	7.40	13	47	34
9	2023	21,523	7.20	14	47	33
10-year Goal	2024	21,587	7.00	16	47	32

[14] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.

4 Implemented Activities

Below is a list of completed activities with estimated water savings. Note that drought response and other measures are not included in the utility's water savings because they are temporary, awareness-based or not able to be accurately quantified on an annual basis.

These are not savings projections of potential future activities. Estimated savings are based on measures that have actually been implemented. If savings are shown to persist in future years, it is because the measure is permanent, such as an ordinance, or the savings are assumed to continue for the reason listed under the itemized activity. Estimated savings from water rate increases are the one exception to these conditions.

Water Rate Increases

Savings from water rate increases were included because entities such as the U.S. Environmental Protection Agency and others indicate specific savings for utilities that raise rates (Texas Water Development Board, 2013; U.S. E.P.A., 1998; Whitcomb, 1999). This project includes surveys of several utilities that have minimal education efforts, perform no other substantive conservation activities, and yet experienced significant demand reduction that coincided with rate increases. In those cases, savings estimates matched up closely with decreases in total GPCD. For many smaller utilities, especially those with customers lacking disposable income, this measure is the only tool used to conserve other than water loss reduction.

The following assumptions were made for water rate increases:

- The model assumes that savings persist into future years because it is expected that the utility will continue to make periodic rate increases in line with the percentage increases from previous years.
- Only the last two rate increases for a utility were quantified.
- Savings grow with demand because as new customers enter the service area, they are assumed to adhere to the same price elasticity model estimates.
- A weighted average for savings was used when rate increases differed between residential and industrial-commercial-institutional (ICI) customers based on the individual utility's customer class breakdown.
- When a utility raised rates using tiered rate conservation pricing, a 50/50 savings split was used when increases differed between base and volumetric rates.
    - The reasoning is that all customers must react to the base increase, yet the pricing signal is stronger when volumetric rate increases affect the higher usage customers.
    - The 50/50 split is reasonable because many customers will not reach the higher volumetric tiers.
    - Studies show that most customers do not actually know they have reached the higher volumetric tiers; just that their bill has increased (Texas Water Development Board, 2013).

4.1 Itemized Activities

1. **Utility Website**
    a. Easy-to-use website with conservation tips and water rates
    b. Features contact information for Public Works staff and customer service

2. **Continuing Public Education**
    a. The utility engages the public in many ways including:
        i. Brochures, bill messages, displays, and exhibits

3. **Water Loss Reduction Savings**[15]
    a. Savings of 44 MG annually in 2015
    b. Water loss reduction savings = the difference between a utility's baseline[16] water loss GPCD submitted in its most recent 5-year water conservation plan and its most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB
    c. If water loss GPCD has increased from the utility's baseline or historic 5-year average to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount.
    d. All savings estimates grow each year at the same rate population figures for the utility grow in the regional water plan.

4. **Water Rate Increases**
    a. Last rate increases:[17]
        i. 9.0% increase in 2015
        ii. 5.0% increase in 2016
    b. Estimated customer demand reduction of 2.6%
    c. Savings is cumulative and based on more than one source[18] (U.S. EPA, 1998; Whitcomb, 1999)
    d. Savings from rate increases are shown to persist over time, however, note that savings from these pricing signals will likely decrease if rates remain the same in future years

5. **Automatic Meter Reading (AMR)/Advanced Metering Infrastructure (AMI)**
    a. These metering systems can save water in a number of ways, including from water loss reduction through improved leak detection.
    b. All water loss reduction savings associated with this activity are detailed in Section 5, which assessed utility baseline water loss GPCD and most recently reported water loss GPCD to determine water savings.

---

[15] If current water loss levels exceed a utility's baseline, this value is treated as a deduction from total quantified savings.
[16] In the absence of having a baseline figure provided in the utility's most recently submitted 5-year water conservation plan, the historic 5-year average for water loss GPCD in the plan was used.
[17] Correspondence with utility staff.
[18] The study estimates a 2% demand reduction with 10% increase in price on a targeted customer class. By applying a ratio, it is possible to determine the savings for lower or higher percentage increases.

c. For estimated water savings that could be increased by implementing meter data management (MDM) and customer engagement portal applications, refer to Section 6 of this report.
    i. With these additional applications, water savings can be achieved through changed customer behavior and other real-time actions that go beyond water loss reduction.

6. High Efficiency (HE) Toilet Replacement Program (SF)
   a. Estimated 10,390 gallons per year per toilet (A&N Technical Services, 2005)
   b. Savings carry on indefinitely because replacement toilet will be as efficient

7. Clotheswasher Replacement Program (SF)
   a. Estimated 83 rebates issued from 2011 – 2016
   b. Rebates per year provided by staff
   c. Estimated 7,030 gallons per year per washer (A&N Technical Services, 2005; THELMA, 1997)
   d. 11-year useful life

5 Summary of Savings

Table 5-1. Savings by Water Conservation Activity (MG).

Year	Clothes Washer Rebate (SF)	HE Toilet Rebate (SF)	Water Rate Increases	TOTAL SAVINGS
2009				0
2010		0.2		0.2
2011	0.1	0.5		0.7
2012	0.3	0.9		1.2
2013	0.4	1.1		1.5
2014	0.4	1.2		1.7
2015	0.5	1.4	19	20.5
2016	0.5	1.4	27	28.9
2017	0.5	1.4	27	29.0

2024	21,587	3.00	47

6 Suggested Activities

Up to four activities were chosen as potential suggested activities for individual reports. These activities are: AMI system with customer portal, twice-per-week (or less) outdoor watering ordinances, strategic water rate increases, and rain barrels.

Activities were chosen because they are:

- Achievable
- Prevalence of vendors that can actually implement them
- Acceptability to city councils, MUD boards, et al.
- Easily adopted
- Cost effective
- Yield high savings relative to cost

AMI systems with customer engagement portals were also chosen because they represent a profusion of future applications that will undoubtedly continue to advance conservation efforts. AMI and meter data management (MDM) companies are developing new and innovative ways to benefit water providers, customers, and ultimately states that are pushing conservation and usage analytics further.

Each utility should be cognizant of the potential impact that these suggested activities may have on its own unique rate and revenue situation.

Benefits to consider:

- Avoided water supply and wastewater costs
    - o The higher water purchase, transmission, and distribution costs are, the greater the potential benefit realized when large amounts of water are conserved with these activities.
- Avoided system expansion costs
    - o Conserving water may allow a utility to postpone building new system capacity by decreasing demand even as population grows.

Costs to consider:

- Staff time and resources
- Unit cost per unit saved
- Implementation costs
- Stakeholder agreement and support
- Other overhead and budget considerations

6.1 Suggested Activities with Savings Estimates

1. Twice-a-week Outdoor Watering Restriction Ordinance
    a. Potentially 5.89% savings of total demand (Hermitte and Mace, 2012; Sierra Club-Lone Star Chapter and National Wildlife Federation, 2015)
    b. Savings could be 61 MG per year with current demand.
    c. See Table 6-1 for potential savings from this measure compared with the city's WMS supply volumes targets.

Table 6-1. Current Savings + Potential Savings from 2x per Week Watering Ordinance (MG).

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Potential Savings from Ordinance	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)
2016	29	44	73	61	0	0	0	135
2017	29	45	74	61	0	0	0	135
2018	29	46	75	61	0	0	0	136
2019	29	46	75	61	0	0	0	136
2020	29	47	76	61	0	0	0	137
2021	29	47	76	61	0	0	0	137
2022	29	47	76	61	0	0	0	137
2023	29	47	76	61	0	0	0	138
2024	29	47	76	61	0	0	0	138
2025	29	47	76	61	0	0	0	138
2026	29	48	77	62	0	0	0	138
2027	29	48	77	62	0	0	0	138
2028	29	48	77	62	0	0	0	138
2029	29	48	77	62	0	0	0	139
2030	29	48	77	62	0	0	0	139
2031	29	48	77	62	0	0	0	139
2032	29	48	77	61	0	0	0	139
2033	29	48	77	61	0	0	0	138
2034	29	48	77	61	0	0	0	138
2035	29	48	77	61	0	0	0	138
2036	29	48	77	61	0	0	0	138
2037	29	48	77	61	0	0	0	138
2038	29	48	77	61	0	0	0	138
2039	29	48	77	61	0	0	0	137
2040	29	48	77	60	0	0	0	137

2. Advanced Metering Infrastructure with Customer Engagement Portal

These portals, along with mobile applications and billing statements, can provide customers with much more access to their water use data in simple and compelling formats. This access and comparison with other customers' usage can reduce water use through changed behavior, as well as provide an opportunity for other conservation programs to be offered to the customer for increased adoption and additional savings. AMI systems support leak notification and web portals with real-time data. Any water loss reduction savings that these systems also yield were included in the water loss assessment of individual reports for this project.

- **a.** Specific utility results will vary based on portal features and frequency of customer notifications
- **b.** Potential savings estimate assumes 20% of residential customers will use and save water due to the portal (Westin Engineering, 2015)
- **c.** Estimate assumes customers will save 10% of total annual use due to the portal
    - i. Savings estimate of 10% is an average of results from multiple studies (Chesnutt and Mitchell, 2013; East Bay Municipal Utility District, 2014; IBM, 2011; Texas A&M and Texas Water Resources Institute, 2016; Westin Engineering, 2015)
- **d.** Residential customers' use assumed to make up approximately 67% of all retail customers' use based on utility profile information submitted to the TWDB
    - i. This was the most common percentage of residential use among participating utilities in this project.
    - ii. Actual customer class demand percentages will vary by utility.
- **e.** 20% of residential customers saving 10% with this customer class breakdown amounts to 1.34% of total demand
- **f.** Savings are assumed to increase along with demand as connections increase each year[19]
- **g.** See Table 6-2 for potential savings from this measure compared with the utility's WMS supply volumes targets.

[19] The 10% consumption reduction figure for 20% of residential customers is conservative, but savings could be greater when monitored yearly as customer engagement increases.

Table 6-2. Current Savings + Potential Savings from AMI with Customer Portal (MG).

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Potential Savings from AMI with Customer Portal	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)
2016	29	44	73	14	0	0	0	87
2017	29	45	74	14	0	0	0	88
2018	29	46	75	14	0	0	0	88
2019	29	46	75	14	0	0	0	89
2020	29	47	76	14	0	0	0	90
2021	29	47	76	14	0	0	0	90
2022	29	47	76	14	0	0	0	90
2023	29	47	76	14	0	0	0	90
2024	29	47	76	14	0	0	0	90
2025	29	47	76	14	0	0	0	90
2026	29	48	77	14	0	0	0	91
2027	29	48	77	14	0	0	0	91
2028	29	48	77	14	0	0	0	91
2029	29	48	77	14	0	0	0	91
2030	29	48	77	14	0	0	0	91
2031	29	48	77	14	0	0	0	91
2032	29	48	77	14	0	0	0	91
2033	29	48	77	14	0	0	0	91
2034	29	48	77	14	0	0	0	91
2035	29	48	77	14	0	0	0	91
2036	29	48	77	14	0	0	0	91
2037	29	48	77	14	0	0	0	91
2038	29	48	77	14	0	0	0	91
2039	29	48	77	14	0	0	0	91
2040	29	48	77	14	0	0	0	91

3. Rain Barrels
   a. In Region L, utilities could save approximately 17 gallons per year per gallon of capacity rebated, sold, or distributed (GDS Associates, 2002).
   b. Estimated 10-year useful life for most barrels

Statewide Water Conservation Quantification Project
City of Uvalde Report • 2017

1 Introduction

In Texas' 2017 State Water Plan, municipal water conservation is projected to meet 9.6 percent[1] of the state's future water needs by 2070. According to the 16 regional water plans that comprise the state water plan, this is expected to be achieved through a variety of measures such as installation of water efficient plumbing fixtures, water conservation pricing structures, water system audits, landscape irrigation ordinances, as well as other water conservation activities. The 9.6 percent is "in addition to the estimated share of future passive conservation savings from plumbing codes and water efficiency standards, which are embedded in municipal water demand projections" (Texas Water Development Board, 2017).

In 2015, the Texas Legislature appropriated funds to the Texas Water Development Board (TWDB) to fund a research project principally charged with quantitatively determining the savings of municipal water conservation activities being implemented in relation to the recommended conservation goals (supply volumes) in the State Water Plan. As part of the project, individual reports were completed for all participating utilities.

With this report, utilities will benefit by receiving a clear and concise picture of its water conservation goals alongside estimated savings from quantifiable activities. In the event that current activity savings may not be able to reach long-term goals, this report offers suggestions on how utilities can reach water conservation goals with activities that are effective, easily adopted, have widespread appeal, and are quantifiable.

2 Municipal Conservation Terminology and Review of Methodology Used by Regional Planners

To make use of the results of this study, it is important to understand several key terms used in the water planning process.

What is a water user group?

In this report, a water user group (WUG) refers to a retail water provider in the form a city, municipal utility district, water control and improvement district, special utility district, water supply corporation, fresh water supply district, or other type of water utility. The TWDB further defines WUGs as one of the following (Texas Water Development Board, 2016b):

- Cities and towns with a population of 500 or more
- Non-city utilities providing more than 280 acre-feet per year per year of water for municipal use
- Collective reporting units (CRUs) consisting of grouped utilities having a common association

[1] Equal to 811,224 acre-feet per year in conservation savings.

- County-Wide WUGs:
    - County-Other (Rural/unincorporated areas of municipal water use)
    - Manufacturing
    - Steam electric power generation

What is a recommended water management strategy?

A recommended water management strategy (WMS) is a measure that will help ensure WUGs have adequate water supplies for their end users well into the future. WMS examples include river diversions, groundwater use, reservoir and aquifer development, and irrigation conservation. When WMS is referred to in this report, it refers only to municipal conservation, which may include water loss reduction as a part of the same strategy.

What is a WMS supply volume?

A WMS supply volume is the amount of water that a given strategy is expected to yield each decade in the planning period if carried out by the WUG. In this report, a WMS supply volume is the amount of water recommended to come from municipal water conservation.

Some regional water plans separate this strategy's supply volume into a volume for municipal water conservation and a volume for water loss reduction for each decade. The total strategy supply volume is the sum of both. A regional water plan may also refer to "advanced conservation" as part of this strategy. Advanced conservation usually indicates that the volume could be achieved through a more robust mix of conservation activities described in the plan.

2.1 Regional Planning Group Approach to Determining Supply Volumes

Each regional water planning group (RWPG) is responsible for producing its own individual plan that, if executed, will provide sufficient water to its WUGs throughout a 50-year planning period. These plans are completed in five-year cycles, with the most recent edition being completed in 2016. The 2016 regional plans make up the 2017 State Water Plan, which sets out WMS supply volumes for the years 2020 through 2070.

The decadal WMS supply volumes for municipal conservation were established by each of the RWPGs in much the same manner. The RWPGs generally followed the guidelines of the Texas Legislature's Water Conservation Implementation Task Force on the pace utilities should target to reduce gallons per capita per day (GPCD)[2] consumption levels.

The targeted reductions used by most regions follow this formula:

- For municipal WUGs with water use of 140 GPCD and greater, the goal is to reduce per capita water use by one percent per year until the level of 140 GPCD is reached,

[2] Regional water planning GPCD is defined as the annual volume of water pumped, diverted, or purchased minus the volume exported (sold) to other water systems or large industrial facilities divided by the permanent resident population of the Municipal Water User Group in the regional water planning process divided by 365. Saline and reused/recycled water are not included in this volume (Texas Water Development Board, 2012).

after which, the goal is to reduce per capita water use by one-fourth percent per year for the remainder of the planning period (Texas Water Development Board, 2016j).

The yearly reductions in GPCD for a given WUG are then converted into recommended supply volumes in acre-feet per year for each decade as the reductions in consumption continue. Some regions reduce GPCD by slightly different percentages before and after the 140 GPCD threshold, some do not apply further reductions in GPCD for WUGs once they reach 140 GPCD, while others recommend only "advanced conservation" activities once WUGs meet 140 GPCD.

2.2 Methodology

In order to complete a uniform quantification process, the first engagement was with utilities that agreed to participate and collected as much relevant data as possible. These data included, among many others, historical GPCD consumption figures, advanced metering infrastructure (AMI) specifications, and detailed feedback on each conservation activity being implemented. Personal interviews focused on determining when and to what extent these activities were being employed, as well as assessing plans to continue such conservation. Examples of frequently implemented activities include tiered water rate conservation pricing, strategic water rate increases, outdoor irrigation audits and ordinances, and rain barrel distribution.

Subsequently, each utility's conservation activities were quantified through several different means, including evidence-based studies, utility field results and savings determinations, manufacturer guarantees, water loss audits, TWDB studies, and other information that assigned a savings value to the activity's implementation.

Every conservation activity studied and quantified has a gallons-per-year estimate, useful life, and decay rate (if applicable) associated with it. Some activities' savings are projected to grow as demand grows over time, while some savings are constant each year and subside once useful life has run its course. For expanded methodology and details on studies and formulas used to determine activity savings, refer to Section 6 of the State Report included as part of this document.

Once analyzed, the resulting savings estimates from each utility were compared with the recommended WMS supply volumes in its respective regional plan to determine if the savings met, exceeded, or fell short of those volumes. Individual utility savings were aggregated to compare with regional volumes, and regional savings were aggregated to compare with state volumes.

It is important to note that this report quantified activity savings—not including water loss reduction—for the WMS supply volume comparison dating back to 2012. The reason for this is, with a few exceptions, the regional planners used 2011 as the base year for establishing potential WMS supply volumes.[3] In addition, any conservation savings achieved through 2011 are assumed to be accounted for in the regional water planning GPCD for that year.[4] Thus, quantifying from 2012 and forward is the most accurate way to determine if utilities are meeting

[3] Confirmed via personal communication with Region C, H, K, and L Plan consultants.
[4] It was established with TWDB planning staff that 2011 GPCD levels were chosen because they represented the most current water use and conservation patterns at the time.

the recommended conservation volumes in the regional plans. This assumption is by no means 100 percent accurate, however. Some previously implemented activities' savings persist into future years beyond this starting point, while some activities' savings have ceased. One year's GPCD will not necessarily include all savings yielded by conservation activities that came before it, but the quantification assessment must have a starting point.

2.3 Quantifiable Savings

The key to the project being useful and reliable is that the results from year to year are measurable. Quantifying conservation activities that can be accurately measured provides greater certainty and better planning for all stakeholders.

While many utilities are engaged in a variety of conservation activities, not all can currently be properly measured. Some examples of these activities include education initiatives, website and social media engagement, and enforcement for water waste. That does not mean these measures are not essential. Education of consumers, for example, is a fundamental activity that makes all others effective, but little hard data exists to quantify the results of education alone.

In addition, the work of conservation coordinators can have a particularly significant effect on the savings of all other activities, but the specific savings attributed to that staff role is difficult to quantify.

3 Results

This report compares Uvalde's current water conservation activities and their quantified savings to two metrics: 1) Region L Water Plan's (Texas Water Development Board, 2016j) recommended WMS supply volumes for municipal conservation, and 2) Uvalde's own 5- and 10-year goals as established in its most recent water conservation plan submitted to the TWDB.

The WMS supply volumes for municipal water conservation are laid out by decade (2020 – 2070) in the regional water plans to serve as benchmarks for what each utility could achieve via that strategy during a 50-year planning period.[5]

The 5- and 10-year goals in Uvalde's most recent water conservation plan are established by the utility as realistic targets for reducing consumption over that timeframe. These reductions[6] are expressed in decreasing total GPCD[7] consumption and water loss GPCD.[8] [9]

The estimated savings in Tables 3-1 through 3-3 indicate the best information available as provided by utility staff. Some ongoing activities may not be known and are within a utility's service area are implemented on a micro-scale that may not be quantified. Individual households

[5] Some regional water plans separate this strategy volume into a volume for water conservation and a volume for water loss reduction for each decade. The total strategy volume is the sum of both.
[6] Occasionally, some utilities expect consumption to increase due to various reasons, such as an incoming industrial presence expected to raise consumption figures for the entire service area.
[7] As defined in TWDB water conservation annual reports: (Total Gallons in System ÷ Permanent Population) ÷ 365
[8] These plans also have targets for residential GPCD and water loss as a percentage (rather than GPCD), but this report does not address those goals.
[9] As defined in annual TWDB water loss audits: (Total Water Loss ÷ Permanent Population) ÷ 365

and businesses may be implementing conservation measures that are unknown and therefore cannot be included in the report.

Explanation of approach to assessing water loss reduction savings

Water loss reduction savings are defined as the volume of water participating utilities are realizing from their water loss mitigation efforts. For this report, this value is the difference between each individual utility's baseline[10] for water loss GPCD and its most recent water loss GPCD reported in 2015 water loss audits on file with TWDB. Savings from all water loss reduction efforts—including pipe replacements and leak repair—are assumed to be included in this comparison to a utility’s baseline.

Note that because a single year (2015) value was used for comparison, it is possible that the 2015 value could be anomalous due to a number of events that may have occurred that year, such as a water main break, a particularly wet year, or a robust effort by the utility to curtail water loss. This will distort future savings figures that were carried forward in the study because water loss will inevitably increase or decrease in later years.

Ideally, using a rolling five-year average in the calculation would correct such anomalies. However, there was insufficient data to do that for every utility. The approach was to use the most complete water loss data possible, which was represented by the 2015 water loss audit. This problem will be further minimized, as continued data collection will allow five-year averages to be calculated for a majority of utilities.

In this way, water loss savings estimates are different from all other activity savings estimates in the project. Whether savings were positive or negative depended on where individual utilities established their own baselines or where their five-year average started, and what water loss GPCD value was reported in 2015.

3.1 Current Savings Compared to Conservation WMS Supply Volume (in million gallons) in Regional Water Plan

Table 3-1 shows a 2070 outlook for Uvalde with the utility’s yearly recommended WMS supply volume in million gallons (MG) alongside its water savings from implemented activities, including from water loss reduction. These activities and their associated savings are covered in greater detail in Sections 4 and 5.

Starting in 2015, this table compares all quantified conservation activity and the recommended conservation WMS supply volume for the planning period. The following definitions pair with the column headers in Table 3-1.

<u>Actual Current Conservation Activity Savings</u> – – All quantified activities currently being performed by the utility, *excluding* savings from water loss reduction. The regional planners used 2011 GPCD as the baseline for determining future conservation WMS supply volumes, therefore the study quantifies utility savings starting in 2012 for this comparison. The summary of these

[10] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.

savings can be referenced in Table 5-1.

Actual Water Loss Reduction Savings (as of 2015) – The difference between the baseline[11] for water loss GPCD and most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB.[12] The summary of these savings can be referenced in Table 5-2.

Total Savings from All Conservation Activity – Actual Current Conservation Activity Savings plus Actual Water Loss Reduction Savings (as of 2015).

Conservation WMS Volume – The recommended municipal water conservation supply volume in the regional plan for the decades ranging from 2020 to 2070. These volumes are converted to MG from the values listed in the plan in acre-feet and then calculated in annual increments.

Water Loss Reduction WMS Volume – Some regional water plans have a separate WMS volume for water conservation and for water loss reduction for each decade. If a WUG's regional plan has a WMS volume for water loss reduction, this column will have values other than zero.

Total Yearly WMS Volume – The sum of the Conservation WMS Volume and Water Loss Reduction WMS Volume.

Over (Short) – The amount that the utility's Total Savings from All Conservation Activity (since 2012), is over or below the Total Yearly WMS Volume in the regional water plan. If the amount falls below the WMS volume, it will appear in parentheses.

[11] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.

[12] If water loss GPCD has increased from the utility's baseline or historic five-year average to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount.

Table 3-1. Current Savings Compared to Conservation WMS Supply Volume (MG) in Regional Water Plan.

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)
2015	4	(169)	(165)	26	0	26	(191)
2016	7	(170)	(163)	32	0	32	(195)

3.2 Utility Water Conservation Plan Goals – Total GPCD

Table 3-2 shows how Uvalde's quantified savings from its implemented activities compare with 5- and 10-year goals established in its individual water conservation plan submitted to the TWDB. The following definitions pair with the column headers in Table 3-2.

Utility Population – Estimated utility service area population for the years indicated.

Total GPCD Goals – Total GPCD goals start with the utility's baseline[13] for total GPCD and progress in subsequent years to match 5- and 10-year goals indicated in a utility's five-year water conservation plan on file with the TWDB. The first five annual GPCD goals were developed by spreading the difference between the baseline and five-year goal evenly over five years. The second five annual GPCD goals spread the difference between the five-year goal and 10-year goal evenly over the next five years.

Annual Savings Goal with Reduction in GPCD (MG) – This column shows what reductions from the baseline GPCD would yield in terms of volume each year as more water is saved. The volumes indicated here are what target GPCD goals look like expressed in million gallons. Annual volumes were derived using the formula: (baseline total GPCD – target total GPCD for that year) x 365 days ÷ 1,000,000 gallons.

Total Savings for All Current Quantified Activities (MG) – Total quantified savings for all current conservation activities and savings from water loss reduction. Refer to Tables 5-1 and 5-2 for details on these savings.

Over (Short) – The amount that the utility's total quantified savings for all current conservation activities (since 2012), including water loss reduction, is over or below the volume represented by reductions in GPCD each year. If the quantified savings are less than these target volumes, the value will appear in parentheses.

Table 3-2. Utility Water Conservation Plan Goals — Total GPCD.

Year #	Year	Utility Population	Total GPCD Goals	Annual Savings Goal with Reduction in GPCD (MG)	Total Savings for All Current Quantified Activities (MG)	Over (Short) (MG)
0	**Baseline**	-	236	0	0	0
1	2008	15,492	234	14	0	(14)
2	2009	15,637	231	27	0	(27)
3	2010	15,782	229	41	0	(41)
4	2011	15,927	226	56	0	(56)
5-year Goal	2012	16,072	224	70	0	(70)
6	2013	16,217	222	85	0	(85)
7	2014	16,362	219	100	2	(98)
8	2015	16,507	217	116	(165)	(281)
9	2016	16,647	214	131	(163)	(294)
10-year Goal	2017	16,787	212	147	(164)	(311)

[13] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for total GPCD from the utility's most recently submitted five-year water conservation plan was used.

3.3 Utility Water Conservation Plan Goals – Water Loss GPCD

Table 3-3 shows how Uvalde's most recent water loss audit compares with five- and 10-year water loss goals in its water conservation plan. The following definitions pair with the column headers in Table 3-2.

Utility Population – Estimated utility service area population for the years indicated.

Water Loss GPCD Goals – Water loss GPCD goals start with the utility's baseline[14] for water loss GPCD and progress in subsequent years to match 5- and 10-year water loss goals indicated in a utility's five-year water conservation plan on file with the TWDB. The first five annual GPCD goals were developed by spreading the difference between the baseline and five-year goal evenly over five years. The second five annual GPCD goals spread the difference between the five-year goal and 10-year goal evenly over the next five years.

Yearly Savings Goal with Reduction in GPCD (MG) – This column shows what reductions from the baseline water loss GPCD would yield in terms of volume each year as more water is saved. The volumes indicated here are what target water loss GPCD goals look like expressed in million gallons. Annual volumes were derived using the formula: (baseline water loss GPCD – target water loss GPCD for that year) x 365 days ÷ 1,000,000 gallons.

Total Savings from Water Loss Reduction (MG) – The difference between a utility's established baseline for water loss GPCD and the most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB. If water loss GPCD has increased from the utility's baseline to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount. Reference Table 5-2 for savings from water loss reduction.

Over (Short) – The amount that the utility's total savings from water loss reduction is over or below the volume represented by reductions in GPCD each year. If water loss reduction savings are less than these target volumes, the value will appear in parentheses.

Table 3-3. Utility Water Conservation Plan Goals — Water Loss GPCD.

Year #	Year	Utility Population	Water Loss GPCD Goals	Yearly Savings Goal with Reduction in GPCD (MG)	Total Savings from Water Loss Reduction (MG)	Over (Short) (MG)
0	**Baseline**	-	17.00	0	0	0
1	2008	15,492	15.80	7	0	(7)
2	2009	15,637	14.60	14	0	(14)
3	2010	15,782	13.40	21	0	(21)
4	2011	15,927	12.20	28	0	(28)
5-year Goal	2012	16,072	11.00	35	0	(35)
6	2013	16,217	10.00	41	0	(41)
7	2014	16,362	9.00	48	0	(48)
8	2015	16,507	8.00	54	(169)	(223)
9	2016	16,647	7.00	61	(170)	(231)
10-year Goal	2017	16,787	6.00	67	(172)	(239)

[14] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.

4 Implemented Activities

Below is a list of completed activities with estimated water savings. Note that drought response and other measures are not included in the utility's water savings because they are temporary, awareness-based or not able to be accurately quantified on an annual basis.

These are not savings projections of potential future activities. Estimated savings are based on measures that have actually been implemented. If savings are shown to persist in future years, it is because the measure is permanent, such as an ordinance, or the savings are assumed to continue for the reason listed under the itemized activity. Estimated savings from water rate increases are the one exception to these conditions.

Water Rate Increases

Savings from water rate increases were included because entities such as the U.S. Environmental Protection Agency and others indicate specific savings for utilities that raise rates (Texas Water Development Board, 2013; U.S. E.P.A., 1998; Whitcomb, 1999). This project includes surveys of several utilities that have minimal education efforts, perform no other substantive conservation activities, and yet experienced significant demand reduction that coincided with rate increases. In those cases, savings estimates matched up closely with decreases in total GPCD. For many smaller utilities, especially those with customers lacking disposable income, this measure is the only tool used to conserve other than water loss reduction.

The following assumptions were made for water rate increases:

- The model assumes that savings persist into future years because it is expected that the utility will continue to make periodic rate increases in line with the percentage increases from previous years.
- Only the last two rate increases for a utility were quantified.
- Savings grow with demand because as new customers enter the service area, they are assumed to adhere to the same price elasticity model estimates.
- A weighted average for savings was used when rate increases differed between residential and industrial-commercial-institutional (ICI) customers based on the individual utility's customer class breakdown.
- When a utility raised rates using tiered rate conservation pricing, a 50/50 savings split was used when increases differed between base and volumetric rates.
    - The reasoning is that all customers must react to the base increase, yet the pricing signal is stronger when volumetric rate increases affect the higher usage customers.
    - The 50/50 split is reasonable because many customers will not reach the higher volumetric tiers.
    - Studies show that most customers do not actually know they have reached the higher volumetric tiers; just that their bill has increased (Texas Water Development Board, 2013).

4.1 Itemized Activities

1. **Utility Website**
    a. Easy-to-use website with conservation tips and water rates
    b. Features contact information for Public Works staff and customer service

2. **Continuing Public Education**
    a. The utility engages the public in many ways including:
        i. Brochures, bill messages, displays, and exhibits

3. **Water Loss Reduction Savings**[15]
    a. Loss of 169 MG annually in 2015
    b. Water loss reduction savings = the difference between a utility's baseline[16] water loss GPCD submitted in its most recent 5-year water conservation plan and its most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB
    c. If water loss GPCD has increased from the utility's baseline or historic 5-year average to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount.
    d. All savings estimates grow each year at the same rate population figures for the utility grow in the regional water plan.

4. **WaterWise Take-home Kits**
    a. Estimated savings of 7,384 gallons per year per kit (Frontier Associates, 2015)
    b. Conservative 5-year useful life for all items in kit
    c. 15% adoption rate assumed

5. **Showerhead Distribution (SF)**
    a. Estimated 2,050 gallons per year per showerhead (A&N Technical Services, 2005)
    b. 5-year useful life
        i. If distributed after 2009, plumbing code will require that replacement is equally as efficient, so savings will carry forward indefinitely

[15] If current water loss levels exceed a utility's baseline, this value is treated as a deduction from total quantified savings.
[16] In the absence of having a baseline figure provided in the utility's most recently submitted 5-year water conservation plan, the historic 5-year average for water loss GPCD in the plan was used.

5 Summary of Savings

Table 5-1. Savings by Water Conservation Activity (MG).

Year	WaterWise Take-home Kits	Low-flow Showerheads (Residential)	TOTAL SAVINGS
2009			0
2010			0
2011			0
2012			0
2013			0
2014	1.1	1.4	2.5
2015	2.2	1.4	3.6
2016	2.2	5.0	7.3
2017	2.2	5.0	7.3
2018	2.2	5.0	7.3
2019	1.1	5.0	6.2
2020		5.0	5
2021		5.0	5
2022		5.0	5
2023		5.0	5
2024		5.0	5
2025		5.0	5
2026		5.0	5
2027		5.0	5
2028		5.0	5
2029		5.0	5

2024	17,852	45.00	(182)

6 Suggested Activities

Up to four activities were chosen as potential suggested activities for individual reports. These activities are: AMI system with customer portal, twice-per-week (or less) outdoor watering ordinances, strategic water rate increases, and rain barrels.

Activities were chosen because they are:

- Achievable
- Prevalence of vendors that can actually implement them
- Acceptability to city councils, MUD boards, et al.
- Easily adopted
- Cost effective
- Yield high savings relative to cost

AMI systems with customer engagement portals were also chosen because they represent a profusion of future applications that will undoubtedly continue to advance conservation efforts. AMI and meter data management (MDM) companies are developing new and innovative ways to benefit water providers, customers, and ultimately states that are pushing conservation and usage analytics further.

Each utility should be cognizant of the potential impact that these suggested activities may have on its own unique rate and revenue situation.

Benefits to consider:

- Avoided water supply and wastewater costs
  - The higher water purchase, transmission, and distribution costs are, the greater the potential benefit realized when large amounts of water are conserved with these activities.
- Avoided system expansion costs
  - Conserving water may allow a utility to postpone building new system capacity by decreasing demand even as population grows.

Costs to consider:

- Staff time and resources
- Unit cost per unit saved
- Implementation costs
- Stakeholder agreement and support
- Other overhead and budget considerations

6.1 Suggested Activities with Savings Estimates

1. Twice-a-week Outdoor Watering Restriction Ordinance
   a. Potentially 7.79% savings of total demand (Hermitte and Mace, 2012; Sierra Club-Lone Star Chapter and National Wildlife Federation, 2015)
   b. Savings could be 100 MG per year with current demand.
   c. See Table 6-1 for potential savings from this measure compared with the city's WMS supply volumes targets.

Table 6-1. Current Savings + Potential Savings from 2x per Week Watering Ordinance (MG).

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Potential Savings from Ordinance	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)
2016	7	(170)	(163)	100	32	0	32	(95)
2017	7	(172)	(164)	101	32	0	32	(96)
2018	7	(173)	(166)	101	39	0	39	(103)
2019	6	(174)	(168)	102	45	0	45	(111)
2020	5	(176)	(171)	103	58	0	58	(126)

2039	5	(205)	(200)	116	273	0	273	(357)
2040	5	(206)	(201)	117	285	0	285	(370)

2. Advanced Metering Infrastructure with Customer Engagement Portal

These portals, along with mobile applications and billing statements, can provide customers with much more access to their water use data in simple and compelling formats. This access and comparison with other customers' usage can reduce water use through changed behavior, as well as provide an opportunity for other conservation programs to be offered to the customer for increased adoption and additional savings. AMI systems support leak notification and web portals with real-time data. Any water loss reduction savings that these systems also yield were included in the water loss assessment of individual reports for this project.

- **a.** Specific utility results will vary based on portal features and frequency of customer notifications
- **b.** Potential savings estimate assumes 20% of residential customers will use and save water due to the portal (Westin Engineering, 2015)
- **c.** Estimate assumes customers will save 10% of total annual use due to the portal
    - i. Savings estimate of 10% is an average of results from multiple studies (Chesnutt and Mitchell, 2013; East Bay Municipal Utility District, 2014; IBM, 2011; Texas A&M and Texas Water Resources Institute, 2016; Westin Engineering, 2015)
- **d.** Residential customers' use assumed to make up approximately 67% of all retail customers' use based on utility profile information submitted to the TWDB
    - i. This was the most common percentage of residential use among participating utilities in this project.
    - ii. Actual customer class demand percentages will vary by utility.
- **e.** 20% of residential customers saving 10% with this customer class breakdown amounts to 1.34% of total demand
- **f.** Savings are assumed to increase along with demand as connections increase each year[17]
- **g.** See Table 6-2 for potential savings from this measure compared with the utility's WMS supply volumes targets.

[17] The 10% consumption reduction figure for 20% of residential customers is conservative, but savings could be greater when monitored yearly as customer engagement increases.

Table 6-2. Current Savings + Potential Savings from AMI with Customer Portal (MG).

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Potential Savings from AMI with Customer Portal	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)
2016	7	(170)	(163)	17	32	0	32	(178)

2023	5	(181)	(176)	18	91	0	91	(248)
2024	5	(182)	(177)	18	101	0	101	(261)
2025	5	(184)	(179)	18	112	0	112	(273)
2026	5	(186)	(181)	18	123	0	123	(285)
2027	5	(187)	(182)	19	134	0	134	(298)
2028	5	(189)	(184)	19	145	0	145	(310)
2029	5	(191)	(186)	19	156	0	156	(322)
2030	5	(192)	(187)	19	167	0	167	(335)
2031	5	(194)	(189)	19	178	0	178	(348)
2032	5	(195)	(190)	19	190	0	190	(361)
2033	5	(197)	(192)	19	202	0	202	(374)
2034	5	(198)	(193)	19	214	0	214	(387)
2035	5	(199)	(194)	20	226	0	226	(401)
2036	5	(201)	(196)	20	238	0	238	(414)
2037	5	(202)	(197)	20	249	0	249	(427)
2038	5	(204)	(199)	20	261	0	261	(440)
2039	5	(205)	(200)	20	273	0	273	(453)
2040	5	(206)	(201)	20	285	0	285	(466)

3. Water Rate Increase
    - **a.** For every 10% increase, estimated savings could be 2% of utility total demand.
    - **b.** Approximately 26 MG of savings per year with current demand
    - **c.** Savings is cumulative and based on more than one source[18] (U.S. EPA, 1998; Whitcomb, 1999)
    - **d.** See Table 6-3 for potential savings from this measure compared with the utility's conservation goals.

[18] The study estimates a 2% demand reduction with 10% increase in price on a targeted customer class. By applying a ratio, it is possible to determine the savings for lower or higher percentage increases.

Table 6-3. Current Savings + Potential Savings from 10% Water Rate Increase (MG).

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Potential Savings from Water Rate Increase	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)
2016	7	(170)	(163)	26	32	0	32	(169)
2017	7	(172)	(164)	26	32	0	32	(171)
2018	7	(173)	(166)	26	39	0	39	(178)

2028	5	(189)	(184)	28	145	0	145	(301)
2029	5	(191)	(186)	28	156	0	156	(313)
2030	5	(192)	(187)	28	167	0	167	(326)
2031	5	(194)	(189)	28	178	0	178	(339)
2032	5	(195)	(190)	29	190	0	190	(352)
2033	5	(197)	(192)	29	202	0	202	(365)
2034	5	(198)	(193)	29	214	0	214	(378)
2035	5	(199)	(194)	29	226	0	226	(391)
2036	5	(201)	(196)	29	238	0	238	(404)
2037	5	(202)	(197)	29	249	0	249	(417)
2038	5	(204)	(199)	30	261	0	261	(430)
2039	5	(205)	(200)	30	273	0	273	(443)
2040	5	(206)	(201)	30	285	0	285	(456)

4. Rain Barrels
    a. In Region L, utilities could save approximately 17 gallons per year per gallon of capacity rebated, sold, or distributed (GDS Associates, 2002).
    b. Estimated 10-year useful life for most barrels

Statewide Water Conservation Quantification Project
City of Victoria Report • 2017

1 Introduction

In Texas' 2017 State Water Plan, municipal water conservation is projected to meet 9.6 percent[1] of the state's future water needs by 2070. According to the 16 regional water plans that comprise the state water plan, this is expected to be achieved through a variety of measures such as installation of water efficient plumbing fixtures, water conservation pricing structures, water system audits, landscape irrigation ordinances, as well as other water conservation activities. The 9.6 percent is "in addition to the estimated share of future passive conservation savings from plumbing codes and water efficiency standards, which are embedded in municipal water demand projections" (Texas Water Development Board, 2017).

In 2015, the Texas Legislature appropriated funds to the Texas Water Development Board (TWDB) to fund a research project principally charged with quantitatively determining the savings of municipal water conservation activities being implemented in relation to the recommended conservation goals (supply volumes) in the State Water Plan. As part of the project, individual reports were completed for all participating utilities.

With this report, utilities will benefit by receiving a clear and concise picture of its water conservation goals alongside estimated savings from quantifiable activities. In the event that current activity savings may not be able to reach long-term goals, this report offers suggestions on how utilities can reach water conservation goals with activities that are effective, easily adopted, have widespread appeal, and are quantifiable.

2 Municipal Conservation Terminology and Review of Methodology Used by Regional Planners

To make use of the results of this study, it is important to understand several key terms used in the water planning process.

What is a water user group?

In this report, a water user group (WUG) refers to a retail water provider in the form a city, municipal utility district, water control and improvement district, special utility district, water supply corporation, fresh water supply district, or other type of water utility. The TWDB further defines WUGs as one of the following (Texas Water Development Board, 2016b):

- Cities and towns with a population of 500 or more
- Non-city utilities providing more than 280 acre-feet per year per year of water for municipal use
- Collective reporting units (CRUs) consisting of grouped utilities having a common association

[1] Equal to 811,224 acre-feet per year in conservation savings.

- County-Wide WUGs:
    - County-Other (Rural/unincorporated areas of municipal water use)
    - Manufacturing
    - Steam electric power generation

What is a recommended water management strategy?

A recommended water management strategy (WMS) is a measure that will help ensure WUGs have adequate water supplies for their end users well into the future. WMS examples include river diversions, groundwater use, reservoir and aquifer development, and irrigation conservation. When WMS is referred to in this report, it refers only to municipal conservation, which may include water loss reduction as a part of the same strategy.

What is a WMS supply volume?

A WMS supply volume is the amount of water that a given strategy is expected to yield each decade in the planning period if carried out by the WUG. In this report, a WMS supply volume is the amount of water recommended to come from municipal water conservation.

Some regional water plans separate this strategy's supply volume into a volume for municipal water conservation and a volume for water loss reduction for each decade. The total strategy supply volume is the sum of both. A regional water plan may also refer to "advanced conservation" as part of this strategy. Advanced conservation usually indicates that the volume could be achieved through a more robust mix of conservation activities described in the plan.

2.1 Regional Planning Group Approach to Determining Supply Volumes

Each regional water planning group (RWPG) is responsible for producing its own individual plan that, if executed, will provide sufficient water to its WUGs throughout a 50-year planning period. These plans are completed in five-year cycles, with the most recent edition being completed in 2016. The 2016 regional plans make up the 2017 State Water Plan, which sets out WMS supply volumes for the years 2020 through 2070.

The decadal WMS supply volumes for municipal conservation were established by each of the RWPGs in much the same manner. The RWPGs generally followed the guidelines of the Texas Legislature's Water Conservation Implementation Task Force on the pace utilities should target to reduce gallons per capita per day (GPCD)[2] consumption levels.

The targeted reductions used by most regions follow this formula:

- For municipal WUGs with water use of 140 GPCD and greater, the goal is to reduce per capita water use by one percent per year until the level of 140 GPCD is reached,

[2] Regional water planning GPCD is defined as the annual volume of water pumped, diverted, or purchased minus the volume exported (sold) to other water systems or large industrial facilities divided by the permanent resident population of the Municipal Water User Group in the regional water planning process divided by 365. Saline and reused/recycled water are not included in this volume (Texas Water Development Board, 2012).

after which, the goal is to reduce per capita water use by one-fourth percent per year for the remainder of the planning period (Texas Water Development Board, 2016j).

The yearly reductions in GPCD for a given WUG are then converted into recommended supply volumes in acre-feet per year for each decade as the reductions in consumption continue. Some regions reduce GPCD by slightly different percentages before and after the 140 GPCD threshold, some do not apply further reductions in GPCD for WUGs once they reach 140 GPCD, while others recommend only “advanced conservation” activities once WUGs meet 140 GPCD.

2.2 Methodology

In order to complete a uniform quantification process, the first engagement was with utilities that agreed to participate and collected as much relevant data as possible. These data included, among many others, historical GPCD consumption figures, advanced metering infrastructure (AMI) specifications, and detailed feedback on each conservation activity being implemented. Personal interviews focused on determining when and to what extent these activities were being employed, as well as assessing plans to continue such conservation. Examples of frequently implemented activities include tiered water rate conservation pricing, strategic water rate increases, outdoor irrigation audits and ordinances, and rain barrel distribution.

Subsequently, each utility’s conservation activities were quantified through several different means, including evidence-based studies, utility field results and savings determinations, manufacturer guarantees, water loss audits, TWDB studies, and other information that assigned a savings value to the activity’s implementation.

Every conservation activity studied and quantified has a gallons-per-year estimate, useful life, and decay rate (if applicable) associated with it. Some activities’ savings are projected to grow as demand grows over time, while some savings are constant each year and subside once useful life has run its course. For expanded methodology and details on studies and formulas used to determine activity savings, refer to Section 6 of the State Report included as part of this document.

Once analyzed, the resulting savings estimates from each utility were compared with the recommended WMS supply volumes in its respective regional plan to determine if the savings met, exceeded, or fell short of those volumes. Individual utility savings were aggregated to compare with regional volumes, and regional savings were aggregated to compare with state volumes.

It is important to note that this report quantified activity savings—not including water loss reduction—for the WMS supply volume comparison dating back to 2012. The reason for this is, with a few exceptions, the regional planners used 2011 as the base year for establishing potential WMS supply volumes.[3] In addition, any conservation savings achieved through 2011 are assumed to be accounted for in the regional water planning GPCD for that year.[4] Thus, quantifying from 2012 and forward is the most accurate way to determine if utilities are meeting

[3] Confirmed via personal communication with Region C, H, K, and L Plan consultants.
[4] It was established with TWDB planning staff that 2011 GPCD levels were chosen because they represented the most current water use and conservation patterns at the time.

the recommended conservation volumes in the regional plans. This assumption is by no means 100 percent accurate, however. Some previously implemented activities' savings persist into future years beyond this starting point, while some activities' savings have ceased. One year's GPCD will not necessarily include all savings yielded by conservation activities that came before it, but the quantification assessment must have a starting point.

2.3 Quantifiable Savings

The key to the project being useful and reliable is that the results from year to year are measurable. Quantifying conservation activities that can be accurately measured provides greater certainty and better planning for all stakeholders.

While many utilities are engaged in a variety of conservation activities, not all can currently be properly measured. Some examples of these activities include education initiatives, website and social media engagement, and enforcement for water waste. That does not mean these measures are not essential. Education of consumers, for example, is a fundamental activity that makes all others effective, but little hard data exists to quantify the results of education alone.

In addition, the work of conservation coordinators can have a particularly significant effect on the savings of all other activities, but the specific savings attributed to that staff role is difficult to quantify.

3 Results

This report compares Victoria's current water conservation activities and their quantified savings to two metrics: 1) Region L Water Plan's (Texas Water Development Board, 2016j) recommended WMS supply volumes for municipal conservation, and 2) Victoria's own 5- and 10-year goals as established in its most recent water conservation plan submitted to the TWDB.

The WMS supply volumes for municipal water conservation are laid out by decade (2020 – 2070) in the regional water plans to serve as benchmarks for what each utility could achieve via that strategy during a 50-year planning period.[5]

The 5- and 10-year goals in Victoria's most recent water conservation plan are established by the utility as realistic targets for reducing consumption over that timeframe. These reductions[6] are expressed in decreasing total GPCD[7] consumption and water loss GPCD.[8] [9]

The estimated savings in Tables 3-1 through 3-3 indicate the best information available as

[5] Some regional water plans separate this strategy volume into a volume for water conservation and a volume for water loss reduction for each decade. The total strategy volume is the sum of both.
[6] Occasionally, some utilities expect consumption to increase due to various reasons, such as an incoming industrial presence expected to raise consumption figures for the entire service area.
[7] As defined in TWDB water conservation plan annual report (Texas Water Development Board, 2016o): (Total Gallons in System ÷ Permanent Population) ÷ 365
[8] These plans also have targets for residential GPCD and water loss as a percentage (rather than GPCD), but this report does not address those goals.
[9] As defined in TWDB water conservation plan annual report (Texas Water Development Board, 2016o): (Total Water Loss ÷ Permanent Population) ÷ 365

provided by utility staff. Some ongoing activities may not be known and are within a utility's service area are implemented on a micro-scale that may not be quantified. Individual households and businesses may be implementing conservation measures that are unknown and therefore cannot be included in the report.

Explanation of approach to assessing water loss reduction savings

Water loss reduction savings are defined as the volume of water participating utilities are realizing from their water loss mitigation efforts. For this report, this value is the difference between each individual utility's baseline[10] for water loss GPCD and its most recent water loss GPCD reported in 2015 water loss audits on file with TWDB. Savings from all water loss reduction efforts—including pipe replacements and leak repair—are assumed to be included in this comparison to a utility's baseline.

Note that because a single year (2015) value was used for comparison, it is possible that the 2015 value could be anomalous due to a number of events that may have occurred that year, such as a water main break, a particularly wet year, or a robust effort by the utility to curtail water loss. This will distort future savings figures that were carried forward in the study because water loss will inevitably increase or decrease in later years.

Ideally, using a rolling five-year average in the calculation would correct such anomalies. However, there was insufficient data to do that for every utility. The approach was to use the most complete water loss data possible, which was represented by the 2015 water loss audit. This problem will be further minimized, as continued data collection will allow five-year averages to be calculated for a majority of utilities.

In this way, water loss savings estimates are different from all other activity savings estimates in the project. Whether savings were positive or negative depended on where individual utilities established their own baselines or where their five-year average started, and what water loss GPCD value was reported in 2015.

3.1 Current Savings Compared to Conservation WMS Supply Volume (in million gallons) in Regional Water Plan

Table 3-1 shows a 2070 outlook for Victoria with the utility's yearly recommended WMS supply volume in million gallons (MG) alongside its water savings from implemented activities, including from water loss reduction. These activities and their associated savings are covered in greater detail in Sections 4 and 5.

Starting in 2015, this table compares all quantified conservation activity and the recommended conservation WMS supply volume for the planning period. The following definitions pair with the column headers in Table 3-1.

<u>Actual Current Conservation Activity Savings</u> – All quantified activities currently being performed by the utility, *excluding* savings from water loss reduction. The regional planners used

[10] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.

2011 GPCD as the baseline for determining future conservation WMS supply volumes, therefore the study quantifies utility savings starting in 2012 for this comparison. The summary of these savings can be referenced in Table 5-1.

Actual Water Loss Reduction Savings (as of 2015) – The difference between the baseline[11] for water loss GPCD and most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB. [12] The summary of these savings can be referenced in Table 5-2.

Total Savings from All Conservation Activity – Actual Current Conservation Activity Savings plus Actual Water Loss Reduction Savings (as of 2015).

Conservation WMS Volume – The recommended municipal water conservation supply volume in the regional plan for the decades ranging from 2020 to 2070. These volumes are converted to MG from the values listed in the plan in acre-feet and then calculated in annual increments.

Water Loss Reduction WMS Volume – Some regional water plans have a separate WMS volume for water conservation and for water loss reduction for each decade. If a WUG's regional plan has a WMS volume for water loss reduction, this column will have values other than zero.

Total Yearly WMS Volume – The sum of the Conservation WMS Volume and Water Loss Reduction WMS Volume.

Over (Short) – The amount that the utility's Total Savings from All Conservation Activity (since 2012), is over or below the Total Yearly WMS Volume in the regional water plan. If the amount falls below the WMS volume, it will appear in parentheses.

[11] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.
[12] If water loss GPCD has increased from the utility's baseline or historic five-year average to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount.

Table 3-1. Current Savings Compared to Conservation WMS Supply Volume (MG) in Regional Water Plan.

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)

2067	93	520	613	2,370	0	2,370	(1,758)
2068	93	521	614	2,397	0	2,397	(1,783)
2069	93	523	616	2,423	0	2,423	(1,808)
2070	93	524	617	2,450	0	2,450	(1,832)

3.2 Utility Water Conservation Plan Goals – Total GPCD

Table 3-2 shows how Victoria's quantified savings from its implemented activities compare with 5- and 10-year goals established in its individual water conservation plan submitted to the TWDB. The following definitions pair with the column headers in Table 3-2.

Utility Population – Estimated utility service area population for the years indicated.

Total GPCD Goals – Total GPCD goals start with the utility's baseline[13] for total GPCD and progress in subsequent years to match 5- and 10-year goals indicated in a utility's five-year water conservation plan on file with the TWDB. The first five annual GPCD goals were developed by spreading the difference between the baseline and five-year goal evenly over five years. The second five annual GPCD goals spread the difference between the five-year goal and 10-year goal evenly over the next five years.

Annual Savings Goal with Reduction in GPCD (MG) – This column shows what reductions from the baseline GPCD would yield in terms of volume each year as more water is saved. The volumes indicated here are what target GPCD goals look like expressed in million gallons. Annual volumes were derived using the formula: (baseline total GPCD – target total GPCD for that year) x 365 days ÷ 1,000,000 gallons.

Total Savings for All Current Quantified Activities (MG) – Total quantified savings for all current conservation activities and savings from water loss reduction. Refer to Tables 5-1 and 5-2 for details on these savings.

Over (Short) – The amount that the utility's total quantified savings for all current conservation activities (since 2012), including water loss reduction, is over or below the volume represented by reductions in GPCD each year. If the quantified savings are less than these target volumes, the value will appear in parentheses.

Table 3-2. Utility Water Conservation Plan Goals — Total GPCD.

Year #	Year	Utility Population	Total GPCD Goals	Annual Savings Goal with Reduction in GPCD (MG)	Total Savings for All Current Quantified Activities (MG)	Over (Short) (MG)
0	**Baseline**	-	153	0	0	0
1	2015	67,574	151	44	495	451
2	2016	67,617	149	89	496	407
3	2017	67,659	148	133	497	363
4	2018	67,702	146	178	497	319
5-year Goal	2019	67,744	144	223	498	275
6	2020	67,787	144	233	499	266
7	2021	68,258	143	244	502	258
8	2022	68,729	143	256	505	249
9	2023	69,200	142	268	509	241
10-year Goal	2024	69,671	142	280	512	232

[13] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for total GPCD from the utility's most recently submitted five-year water conservation plan was used.

3.3 Utility Water Conservation Plan Goals – Water Loss GPCD

Table 3-3 shows how Victoria's most recent water loss audit compares with five- and 10-year water loss goals in its water conservation plan. The following definitions pair with the column headers in Table 3-2.

Utility Population – Estimated utility service area population for the years indicated.

Water Loss GPCD Goals – Water loss GPCD goals start with the utility's baseline[14] for water loss GPCD and progress in subsequent years to match 5- and 10-year water loss goals indicated in a utility's five-year water conservation plan on file with the TWDB. The first five annual GPCD goals were developed by spreading the difference between the baseline and five-year goal evenly over five years. The second five annual GPCD goals spread the difference between the five-year goal and 10-year goal evenly over the next five years.

Yearly Savings Goal with Reduction in GPCD (MG) – This column shows what reductions from the baseline water loss GPCD would yield in terms of volume each year as more water is saved. The volumes indicated here are what target water loss GPCD goals look like expressed in million gallons. Annual volumes were derived using the formula: (baseline water loss GPCD – target water loss GPCD for that year) x 365 days ÷ 1,000,000 gallons.

Total Savings from Water Loss Reduction (MG) – The difference between a utility's established baseline for water loss GPCD and the most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB. If water loss GPCD has increased from the utility's baseline to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount. Reference Table 5-2 for savings from water loss reduction.

Over (Short) – The amount that the utility's total savings from water loss reduction is over or below the volume represented by reductions in GPCD each year. If water loss reduction savings are less than these target volumes, the value will appear in parentheses.

Table 3-3. Utility Water Conservation Plan Goals — Water Loss GPCD.

Year #	Year	Utility Population	Total GPCD Goals	Annual Savings Goal with Reduction in GPCD (MG)	Total Savings for All Current Quantified Activities (MG)	Over (Short) (MG)
0	**Baseline**	-	153	0	0	0
1	2015	67,574	151	44	495	451
2	2016	67,617	149	89	496	407
3	2017	67,659	148	133	497	363
4	2018	67,702	146	178	497	319
5-year Goal	2019	67,744	144	223	498	275
6	2020	67,787	144	233	499	266
7	2021	68,258	143	244	502	258
8	2022	68,729	143	256	505	249
9	2023	69,200	142	268	509	241
10-year Goal	2024	69,671	142	280	512	232

[14] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.

4 Implemented Activities

Below is a list of completed activities with estimated water savings. Note that drought response and other measures are not included in the utility's water savings because they are temporary, awareness-based or not able to be accurately quantified on an annual basis.

These are not savings projections of potential future activities. Estimated savings are based on measures that have actually been implemented. If savings are shown to persist in future years, it is because the measure is permanent, such as an ordinance, or the savings are assumed to continue for the reason listed under the itemized activity. Estimated savings from water rate increases are the one exception to these conditions.

Water Rate Increases

Savings from water rate increases were included because entities such as the U.S. Environmental Protection Agency and others indicate specific savings for utilities that raise rates (Texas Water Development Board, 2013; U.S. E.P.A., 1998; Whitcomb, 1999). This project includes surveys of several utilities that have minimal education efforts, perform no other substantive conservation activities, and yet experienced significant demand reduction that coincided with rate increases. In those cases, savings estimates matched up closely with decreases in total GPCD. For many smaller utilities, especially those with customers lacking disposable income, this measure is the only tool used to conserve other than water loss reduction.

The following assumptions were made for water rate increases:

- The model assumes that savings persist into future years because it is expected that the utility will continue to make periodic rate increases in line with the percentage increases from previous years.
- Only the last two rate increases for a utility were quantified.
- Savings grow with demand because as new customers enter the service area, they are assumed to adhere to the same price elasticity model estimates.
- A weighted average for savings was used when rate increases differed between residential and industrial-commercial-institutional (ICI) customers based on the individual utility's customer class breakdown.
- When a utility raised rates using tiered rate conservation pricing, a 50/50 savings split was used when increases differed between base and volumetric rates.
    - The reasoning is that all customers must react to the base increase, yet the pricing signal is stronger when volumetric rate increases affect the higher usage customers.
    - The 50/50 split is reasonable because many customers will not reach the higher volumetric tiers.
    - Studies show that most customers do not actually know they have reached the higher volumetric tiers; just that their bill has increased (Texas Water Development Board, 2013).

4.1 Itemized Activities

1. **Utility Website**
    a. Easy-to-use website with conservation tips and water rates
    b. Features contact information for Public Works staff and customer service

2. **Continuing Public Education**
    a. The utility engages the public in many ways including:
        i. Brochures, bill messages, displays, and exhibits

3. **Water Loss Reduction Savings**
    a. Loss of 419 MG annually in 2015
    b. Water loss reduction savings = the difference between a utility's baseline[15] water loss GPCD submitted in its most recent 5-year water conservation plan and its most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB
    c. If water loss GPCD has increased from the utility's baseline or historic 5-year average to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount.
    d. All savings estimates grow each year at the same rate population figures for the utility grow in the regional water plan.

4. **Water Rate Increase**
    a. Last rate increase:[16]
        i. 7.0% increase in 2014
    b. Estimated customer demand reduction of 1.4%
    c. Savings is cumulative and based on more than one source[17] (U.S. EPA, 1998; Whitcomb, 1999)
    d. Savings from rate increases are shown to persist over time, however, note that savings from these pricing signals will likely decrease if rates remain the same in future years.

5. **Automatic Meter Reading (AMR)/Advanced Metering Infrastructure (AMI)**
    a. These metering systems can save water in a number of ways, including from water loss reduction through improved leak detection.
    b. All water loss reduction savings associated with this activity are detailed in Section 5, which assessed utility baseline water loss GPCD and most recently reported water loss GPCD to determine water savings.
    c. For estimated water savings that could be increased by implementing meter data management (MDM) and customer engagement portal applications, refer to Section 6 of this report.

---

[15] In the absence of having a baseline figure provided in the utility's most recently submitted 5-year water conservation plan, the historic 5-year average for water loss GPCD in the plan was used.
[16] Correspondence with utility staff.
[17] The study estimates a 2% demand reduction with 10% increase in price on a targeted customer class. By applying a ratio, it is possible to determine the savings for lower or higher percentage increases.

i. With these additional applications, water savings can be achieved through changed customer behavior and other real-time actions that go beyond water loss reduction.

5 Summary of Savings

Table 5-1. Savings by Water Conservation Activity (MG).

Year	Water Rate Increase	TOTAL SAVINGS
2012		0

6 Suggested Activities

Up to four activities were chosen as potential suggested activities for individual reports. These activities are: AMI system with customer portal, twice-per-week (or less) outdoor watering ordinances, strategic water rate increases, and rain barrels.

Activities were chosen because they are:

- Achievable
- Prevalence of vendors that can actually implement them
- Acceptability to city councils, MUD boards, et al.
- Easily adopted
- Cost effective
- Yield high savings relative to cost

AMI systems with customer engagement portals were also chosen because they represent a profusion of future applications that will undoubtedly continue to advance conservation efforts. AMI and meter data management (MDM) companies are developing new and innovative ways to benefit water providers, customers, and ultimately states that are pushing conservation and usage analytics further.

Each utility should be cognizant of the potential impact that these suggested activities may have on its own unique rate and revenue situation.

Benefits to consider:

- Avoided water supply and wastewater costs
    - The higher water purchase, transmission, and distribution costs are, the greater the potential benefit realized when large amounts of water are conserved with these activities.
- Avoided system expansion costs
    - Conserving water may allow a utility to postpone building new system capacity by decreasing demand even as population grows.

Costs to consider:

- Staff time and resources
- Unit cost per unit saved
- Implementation costs
- Stakeholder agreement and support
- Other overhead and budget considerations

6.1 Suggested Activities with Savings Estimates

1. Twice-a-week Outdoor Watering Restriction Ordinance
   a. Potentially 5.26% savings of total demand (Hermitte and Mace, 2012; Sierra Club-Lone Star Chapter and National Wildlife Federation, 2015)
   b. Savings could be 287 MG per year with current demand.
   c. See Table 6-1 for potential savings from this measure compared with the city's WMS supply volumes targets.

Table 6-1. Current Savings + Potential Savings from 2x per Week Watering Ordinance (MG).

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Potential Savings from Ordinance	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)
2016	77	420	496	287	146	0	146	637
2017	77	420	497	289	146	0	146	639
2018	77	420	497	290	176	0	176	612
2019	78	420	498	292	205	0	205	585
2020	78	421	499	293	264	0	264	528
2021	78	424	502	295	309	0	309	488
2022	79	426	505	296	354	0	354	447
2023	79	429	509	298	400	0	400	407

2. Advanced Metering Infrastructure with Customer Engagement Portal

These portals, along with mobile applications and billing statements, can provide customers with much more access to their water use data in simple and compelling formats. This access and comparison with other customers' usage can reduce water use through changed behavior, as well as provide an opportunity for other conservation programs to be offered to the customer for increased adoption and additional savings. AMI systems support leak notification and web portals with real-time data. Any water loss reduction savings that these systems also yield were included in the water loss assessment of individual reports for this project.

- **a.** Specific utility results will vary based on portal features and frequency of customer notifications
- **b.** Potential savings estimate assumes 20% of residential customers will use and save water due to the portal (Westin Engineering, 2015)
- **c.** Estimate assumes customers will save 10% of total annual use due to the portal
    - i. Savings estimate of 10% is an average of results from multiple studies (Chesnutt and Mitchell, 2013; East Bay Municipal Utility District, 2014; IBM, 2011; Texas A&M and Texas Water Resources Institute, 2016; Westin Engineering, 2015)
- **d.** Residential customers' use assumed to make up approximately 67% of all retail customers' use based on utility profile information submitted to the TWDB
    - i. This was the most common percentage of residential use among participating utilities in this project.
    - ii. Actual customer class demand percentages will vary by utility.
- **e.** 20% of residential customers saving 10% with this customer class breakdown amounts to 1.34% of total demand
- **f.** Savings are assumed to increase along with demand as connections increase each year[18]
- **g.** See Table 6-2 for potential savings from this measure compared with the utility's WMS supply volumes targets.

[18] The 10% consumption reduction figure for 20% of residential customers is conservative, but savings could be greater when monitored yearly as customer engagement increases.

Table 6-2. Current Savings + Potential Savings from AMI with Customer Portal (MG).

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Potential Savings from AMI with Customer Portal	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)

3. Rain Barrels
   a. In Region L, utilities could save approximately 17 gallons per year per gallon of capacity rebated, sold, or distributed (GDS Associates, 2002).
   b. Estimated 10-year useful life for most barrels

Region M Individual Reports

Statewide Water Conservation Quantification Project
Agua SUD Report • 2017

1 Introduction

In Texas' 2017 State Water Plan, municipal water conservation is projected to meet 9.6 percent[1] of the state's future water needs by 2070. According to the 16 regional water plans that comprise the state water plan, this is expected to be achieved through a variety of measures such as installation of water efficient plumbing fixtures, water conservation pricing structures, water system audits, landscape irrigation ordinances, as well as other water conservation activities. The 9.6 percent is "in addition to the estimated share of future passive conservation savings from plumbing codes and water efficiency standards, which are embedded in municipal water demand projections" (Texas Water Development Board, 2017).

In 2015, the Texas Legislature appropriated funds to the Texas Water Development Board (TWDB) to fund a research project principally charged with quantitatively determining the savings of municipal water conservation activities being implemented in relation to the recommended conservation goals (supply volumes) in the State Water Plan. As part of the project, individual reports were completed for all participating utilities.

With this report, utilities will benefit by receiving a clear and concise picture of its water conservation goals alongside estimated savings from quantifiable activities. In the event that current activity savings may not be able to reach long-term goals, this report offers suggestions on how utilities can reach water conservation goals with activities that are effective, easily adopted, have widespread appeal, and are quantifiable.

2 Municipal Conservation Terminology and Review of Methodology Used by Regional Planners

To make use of the results of this study, it is important to understand several key terms used in the water planning process.

What is a water user group?

In this report, a water user group (WUG) refers to a retail water provider in the form a city, municipal utility district, water control and improvement district, special utility district, water supply corporation, fresh water supply district, or other type of water utility. The TWDB further defines WUGs as one of the following (Texas Water Development Board, 2016b):

- Cities and towns with a population of 500 or more
- Non-city utilities providing more than 280 acre-feet per year per year of water for municipal use
- Collective reporting units (CRUs) consisting of grouped utilities having a common association

[1] Equal to 811,224 acre-feet per year in conservation savings.

- County-Wide WUGs:
  - County-Other (Rural/unincorporated areas of municipal water use)
  - Manufacturing
  - Steam electric power generation

What is a recommended water management strategy?

A recommended water management strategy (WMS) is a measure that will help ensure WUGs have adequate water supplies for their end users well into the future. WMS examples include river diversions, groundwater use, reservoir and aquifer development, and irrigation conservation. When WMS is referred to in this report, it refers only to municipal conservation, which may include water loss reduction as a part of the same strategy.

What is a WMS supply volume?

A WMS supply volume is the amount of water that a given strategy is expected to yield each decade in the planning period if carried out by the WUG. In this report, a WMS supply volume is the amount of water recommended to come from municipal water conservation.

Some regional water plans separate this strategy's supply volume into a volume for municipal water conservation and a volume for water loss reduction for each decade. The total strategy supply volume is the sum of both. A regional water plan may also refer to "advanced conservation" as part of this strategy. Advanced conservation usually indicates that the volume could be achieved through a more robust mix of conservation activities described in the plan.

2.1 Regional Planning Group Approach to Determining Supply Volumes

Each regional water planning group (RWPG) is responsible for producing its own individual plan that, if executed, will provide sufficient water to its WUGs throughout a 50-year planning period. These plans are completed in five-year cycles, with the most recent edition being completed in 2016. The 2016 regional plans make up the 2017 State Water Plan, which sets out WMS supply volumes for the years 2020 through 2070.

The decadal WMS supply volumes for municipal conservation were established by each of the RWPGs in much the same manner. The RWPGs generally followed the guidelines of the Texas Legislature's Water Conservation Implementation Task Force on the pace utilities should target to reduce gallons per capita per day (GPCD)[2] consumption levels.

The targeted reductions used by most regions follow this formula:

- For municipal WUGs with water use of 140 GPCD and greater, the goal is to reduce per capita water use by one percent per year until the level of 140 GPCD is reached,

[2] Regional water planning GPCD is defined as the annual volume of water pumped, diverted, or purchased minus the volume exported (sold) to other water systems or large industrial facilities divided by the permanent resident population of the Municipal Water User Group in the regional water planning process divided by 365. Saline and reused/recycled water are not included in this volume (Texas Water Development Board, 2012).

> after which, the goal is to reduce per capita water use by one-fourth percent per year for the remainder of the planning period (Texas Water Development Board, 2016j).

The yearly reductions in GPCD for a given WUG are then converted into recommended supply volumes in acre-feet per year for each decade as the reductions in consumption continue. Some regions reduce GPCD by slightly different percentages before and after the 140 GPCD threshold, some do not apply further reductions in GPCD for WUGs once they reach 140 GPCD, while others recommend only "advanced conservation" activities once WUGs meet 140 GPCD.

2.2 Methodology

In order to complete a uniform quantification process, the first engagement was with utilities that agreed to participate and collected as much relevant data as possible. These data included, among many others, historical GPCD consumption figures, advanced metering infrastructure (AMI) specifications, and detailed feedback on each conservation activity being implemented. Personal interviews focused on determining when and to what extent these activities were being employed, as well as assessing plans to continue such conservation. Examples of frequently implemented activities include tiered water rate conservation pricing, strategic water rate increases, outdoor irrigation audits and ordinances, and rain barrel distribution.

Subsequently, each utility's conservation activities were quantified through several different means, including evidence-based studies, utility field results and savings determinations, manufacturer guarantees, water loss audits, TWDB studies, and other information that assigned a savings value to the activity's implementation.

Every conservation activity studied and quantified has a gallons-per-year estimate, useful life, and decay rate (if applicable) associated with it. Some activities' savings are projected to grow as demand grows over time, while some savings are constant each year and subside once useful life has run its course. For expanded methodology and details on studies and formulas used to determine activity savings, refer to Section 6 of the State Report included as part of this document.

Once analyzed, the resulting savings estimates from each utility were compared with the recommended WMS supply volumes in its respective regional plan to determine if the savings met, exceeded, or fell short of those volumes. Individual utility savings were aggregated to compare with regional volumes, and regional savings were aggregated to compare with state volumes.

It is important to note that this report quantified activity savings—not including water loss reduction—for the WMS supply volume comparison dating back to 2012. The reason for this is, with a few exceptions, the regional planners used 2011 as the base year for establishing potential WMS supply volumes.[3] In addition, any conservation savings achieved through 2011 are assumed to be accounted for in the regional water planning GPCD for that year.[4] Thus, quantifying from 2012 and forward is the most accurate way to determine if utilities are meeting

---

[3] Confirmed via personal communication with Region C, H, K, and L Plan consultants.

[4] It was established with TWDB planning staff that 2011 GPCD levels were chosen because they represented the most current water use and conservation patterns at the time.

the recommended conservation volumes in the regional plans. This assumption is by no means 100 percent accurate, however. Some previously implemented activities' savings persist into future years beyond this starting point, while some activities' savings have ceased. One year's GPCD will not necessarily include all savings yielded by conservation activities that came before it, but the quantification assessment must have a starting point.

2.3 Quantifiable Savings

The key to the project being useful and reliable is that the results from year to year are measurable. Quantifying conservation activities that can be accurately measured provides greater certainty and better planning for all stakeholders.

While many utilities are engaged in a variety of conservation activities, not all can currently be properly measured. Some examples of these activities include education initiatives, website and social media engagement, and enforcement for water waste. That does not mean these measures are not essential. Education of consumers, for example, is a fundamental activity that makes all others effective, but little hard data exists to quantify the results of education alone.

In addition, the work of conservation coordinators can have a particularly significant effect on the savings of all other activities, but the specific savings attributed to that staff role is difficult to quantify.

3 Results

This report compares Agua SUD's current water conservation activities and their quantified savings to two metrics: 1) Region M Water Plan's (Texas Water Development Board, 2016k) recommended WMS supply volumes for municipal conservation, and 2) Agua SUD's own 5- and 10-year goals as established in its most recent water conservation plan submitted to the TWDB.

The WMS supply volumes for municipal water conservation are laid out by decade (2020 – 2070) in the regional water plans to serve as benchmarks for what each utility could achieve via that strategy during a 50-year planning period.[5]

The 5- and 10-year goals in Agua SUD's most recent water conservation plan are established by the utility as realistic targets for reducing consumption over that timeframe. These reductions[6] are expressed in decreasing total GPCD[7] consumption and water loss GPCD.[8,9]

The estimated savings in Tables 3-1 through 3-3 indicate the best information available as

---

5 Some regional water plans separate this strategy volume into a volume for water conservation and a volume for water loss reduction for each decade. The total strategy volume is the sum of both.

6 Occasionally, some utilities expect consumption to increase due to various reasons, such as an incoming industrial presence expected to raise consumption figures for the entire service area.

7 As defined in TWDB water conservation plan annual report (Texas Water Development Board, 2016o): (Total Gallons in System ÷ Permanent Population) ÷ 365

8 These plans also have targets for residential GPCD and water loss as a percentage (rather than GPCD), but this report does not address those goals.

9 As defined in TWDB water conservation plan annual report (Texas Water Development Board, 2016o): (Total Water Loss ÷ Permanent Population) ÷ 365

provided by utility staff. Some ongoing activities may not be known and are within a utility's service area are implemented on a micro-scale that may not be quantified. Individual households and businesses may be implementing conservation measures that are unknown and therefore cannot be included in the report.

Explanation of approach to assessing water loss reduction savings

Water loss reduction savings are defined as the volume of water participating utilities are realizing from their water loss mitigation efforts. For this report, this value is the difference between each individual utility's baseline[10] for water loss GPCD and its most recent water loss GPCD reported in 2015 water loss audits on file with TWDB. Savings from all water loss reduction efforts—including pipe replacements and leak repair—are assumed to be included in this comparison to a utility's baseline.

Note that because a single year (2015) value was used for comparison, it is possible that the 2015 value could be anomalous due to a number of events that may have occurred that year, such as a water main break, a particularly wet year, or a robust effort by the utility to curtail water loss. This will distort future savings figures that were carried forward in the study because water loss will inevitably increase or decrease in later years.

Ideally, using a rolling five-year average in the calculation would correct such anomalies. However, there was insufficient data to do that for every utility. The approach was to use the most complete water loss data possible, which was represented by the 2015 water loss audit. This problem will be further minimized, as continued data collection will allow five-year averages to be calculated for a majority of utilities.

In this way, water loss savings estimates are different from all other activity savings estimates in the project. Whether savings were positive or negative depended on where individual utilities established their own baselines or where their five-year average started, and what water loss GPCD value was reported in 2015.

3.1 Current Savings Compared to Conservation WMS Supply Volume (in million gallons) in Regional Water Plan

Table 3-1 shows the 2070 outlook for Agua SUD with the utility's yearly recommended WMS supply volume in million gallons (MG) alongside its water savings from implemented activities, including from water loss reduction. These activities and their associated savings are covered in greater detail in Sections 4 and 5.

Starting in 2015, this table compares all quantified conservation activity and the recommended conservation WMS supply volume for the planning period. The following definitions pair with the column headers in Table 3-1.

<u>Actual Current Conservation Activity Savings</u> – All quantified activities currently being performed by the utility, *excluding* savings from water loss reduction. The regional planners used

[10] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.

2011 GPCD as the baseline for determining future conservation WMS supply volumes, therefore the study quantifies utility savings starting in 2012 for this comparison. The summary of these savings can be referenced in Table 5-1.

Actual Water Loss Reduction Savings (as of 2015) – The difference between the baseline[11] for water loss GPCD and most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB. [12] The summary of these savings can be referenced in Table 5-2.

Total Savings from All Conservation Activity – Actual Current Conservation Activity Savings plus Actual Water Loss Reduction Savings (as of 2015).

Conservation WMS Volume – The recommended municipal water conservation supply volume in the regional plan for the decades ranging from 2020 to 2070. These volumes are converted to MG from the values listed in the plan in acre-feet and then calculated in annual increments.

Water Loss Reduction WMS Volume – Some regional water plans have a separate WMS volume for water conservation and for water loss reduction for each decade. If a WUG's regional plan has a WMS volume for water loss reduction, this column will have values other than zero.

Total Yearly WMS Volume – The sum of the Conservation WMS Volume and Water Loss Reduction WMS Volume.

Over (Short) – The amount that the utility's Total Savings from All Conservation Activity (since 2012), is over or below the Total Yearly WMS Volume in the regional water plan. If the amount falls below the WMS volume, it will appear in parentheses.

[11] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.
[12] If water loss GPCD has increased from the utility's baseline or historic five-year average to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount.

Table 3-1. Current Savings Compared to Conservation WMS Supply Volume (MG) in Regional Water Plan.

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)

3.2 Utility Water Conservation Plan Goals – Total GPCD

Table 3-2 shows how Agua SUD's quantified savings from its implemented activities compare with 5- and 10-year goals established in its individual water conservation plan submitted to the TWDB. The following definitions pair with the column headers in Table 3-2.

Utility Population – Estimated utility service area population for the years indicated.

Total GPCD Goals – Total GPCD goals start with the utility's baseline[13] for total GPCD and progress in subsequent years to match 5- and 10-year goals indicated in a utility's five-year water conservation plan on file with the TWDB. The first five annual GPCD goals were developed by spreading the difference between the baseline and five-year goal evenly over five years. The second five annual GPCD goals spread the difference between the five-year goal and 10-year goal evenly over the next five years.

Annual Savings Goal with Reduction in GPCD (MG) – This column shows what reductions from the baseline GPCD would yield in terms of volume each year as more water is saved. The volumes indicated here are what target GPCD goals look like expressed in million gallons. Annual volumes were derived using the formula: (baseline total GPCD – target total GPCD for that year) x 365 days ÷ 1,000,000 gallons.

Total Savings for All Current Quantified Activities (MG) – Total quantified savings for all current conservation activities and savings from water loss reduction. Refer to Tables 5-1 and 5-2 for details on these savings.

Over (Short) – The amount that the utility's total quantified savings for all current conservation activities (since 2012), including water loss reduction, is over or below the volume represented by reductions in GPCD each year. If the quantified savings are less than these target volumes, the value will appear in parentheses.

Table 3-2. Utility Water Conservation Plan Goals — Total GPCD.

Year #	Year	Utility Population	Total GPCD Goals	Annual Savings Goal with Reduction in GPCD (MG)	Total Savings for All Current Quantified Activities (MG)	Over (Short) (MG)
0	**Baseline**	-	103	0	0	0
1	2015	45,483	101	27	76	50
2	2016	46,812	100	55	78	24
3	2017	48,141	98	84	80	(4)
4	2018	49,471	97	116	82	(33)
5-year Goal	2019	50,800	95	148	84	(64)
6	2020	52,129	94	171	86	(85)
7	2021	53,389	93	195	88	(106)
8	2022	54,649	92	219	90	(129)
9	2023	55,909	91	245	92	(153)
10-year Goal	2024	57,169	90	271	94	(177)

[13] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for total GPCD from the utility's most recently submitted five-year water conservation plan was used.

3.3 Utility Water Conservation Plan Goals – Water Loss GPCD

Table 3-3 shows how Agua SUD's most recent water loss audit compares with five- and 10-year water loss goals in its water conservation plan. The following definitions pair with the column headers in Table 3-2.

Utility Population – Estimated utility service area population for the years indicated.

Water Loss GPCD Goals – Water loss GPCD goals start with the utility's baseline[14] for water loss GPCD and progress in subsequent years to match 5- and 10-year water loss goals indicated in a utility's five-year water conservation plan on file with the TWDB. The first five annual GPCD goals were developed by spreading the difference between the baseline and five-year goal evenly over five years. The second five annual GPCD goals spread the difference between the five-year goal and 10-year goal evenly over the next five years.

Yearly Savings Goal with Reduction in GPCD (MG) – This column shows what reductions from the baseline water loss GPCD would yield in terms of volume each year as more water is saved. The volumes indicated here are what target water loss GPCD goals look like expressed in million gallons. Annual volumes were derived using the formula: (baseline water loss GPCD – target water loss GPCD for that year) x 365 days ÷ 1,000,000 gallons.

Total Savings from Water Loss Reduction (MG) – The difference between a utility's established baseline for water loss GPCD and the most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB. If water loss GPCD has increased from the utility's baseline to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount. Reference Table 5-2 for savings from water loss reduction.

Over (Short) – The amount that the utility's total savings from water loss reduction is over or below the volume represented by reductions in GPCD each year. If water loss reduction savings are less than these target volumes, the value will appear in parentheses.

Table 3-3. Utility Water Conservation Plan Goals — Water Loss GPCD.

Year #	Year	Utility Population	Water Loss GPCD Goals	Yearly Savings Goal with Reduction in GPCD (MG)	Total Savings from Water Loss Reduction (MG)	Over (Short) (MG)
0	**Baseline**	-	15.00	0	0	0
1	2015	45,483	14.60	7	50	43
2	2016	46,812	14.20	14	51	38
3	2017	48,141	13.80	21	53	32
4	2018	49,471	13.40	29	54	25
5-year Goal	2019	50,800	13.00	37	56	19
6	2020	52,129	12.90	40	57	17
7	2021	53,389	12.80	43	58	16
8	2022	54,649	12.70	46	60	14
9	2023	55,909	12.60	49	61	12
10-year Goal	2024	57,169	12.50	52	63	10

[14] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.

4 Implemented Activities

Below is a list of completed activities with estimated water savings. Note that drought response and other measures are not included in the utility's water savings because they are temporary, awareness-based or not able to be accurately quantified on an annual basis.

These are not savings projections of potential future activities. Estimated savings are based on measures that have actually been implemented. If savings are shown to persist in future years, it is because the measure is permanent, such as an ordinance, or the savings are assumed to continue for the reason listed under the itemized activity. Estimated savings from water rate increases are the one exception to these conditions.

Water Rate Increases

Savings from water rate increases were included because entities such as the U.S. Environmental Protection Agency and others indicate specific savings for utilities that raise rates (Texas Water Development Board, 2013; U.S. E.P.A., 1998; Whitcomb, 1999). This project includes surveys of several utilities that have minimal education efforts, perform no other substantive conservation activities, and yet experienced significant demand reduction that coincided with rate increases. In those cases, savings estimates matched up closely with decreases in total GPCD. For many smaller utilities, especially those with customers lacking disposable income, this measure is the only tool used to conserve other than water loss reduction.

The following assumptions were made for water rate increases:

- The model assumes that savings persist into future years because it is expected that the utility will continue to make periodic rate increases in line with the percentage increases from previous years.
- Only the last two rate increases for a utility were quantified.
- Savings grow with demand because as new customers enter the service area, they are assumed to adhere to the same price elasticity model estimates.
- A weighted average for savings was used when rate increases differed between residential and industrial-commercial-institutional (ICI) customers based on the individual utility's customer class breakdown.
- When a utility raised rates using tiered rate conservation pricing, a 50/50 savings split was used when increases differed between base and volumetric rates.
    - The reasoning is that all customers must react to the base increase, yet the pricing signal is stronger when volumetric rate increases affect the higher usage customers.
    - The 50/50 split is reasonable because many customers will not reach the higher volumetric tiers.
    - Studies show that most customers do not actually know they have reached the higher volumetric tiers; just that their bill has increased (Texas Water Development Board, 2013).

4.1 Itemized Activities

1. **Utility Website**
    a. Easy-to-use website with conservation tips and water rates
    b. Features contact information for Public Works staff and customer service

2. **Continuing Public Education**
    a. The utility engages the public in many ways including:
        i. Brochures, bill messages, displays, and exhibits

3. **Water Loss Reduction Savings**[15]
    a. Savings of 50 MG annually in 2015
    b. Water loss reduction savings = the difference between a utility's baseline[16] water loss GPCD submitted in its most recent 5-year water conservation plan and its most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB
    c. If water loss GPCD has increased from the utility's baseline or historic 5-year average to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount.
    d. All savings estimates grow each year at the same rate population figures for the utility grow in the regional water plan.

4. **Water Rate Increase**
    a. Last rate increase:[17]
        i. 8.0% increase in 2014
    b. Estimated customer demand reduction of 1.6%
    c. Savings is cumulative and based on more than one source[18] (U.S. EPA, 1998; Whitcomb, 1999)
    d. Savings from rate increases are shown to persist over time, however, note that savings from these pricing signals will likely decrease if rates remain the same in future years.

---

[15] If current water loss levels exceed a utility's baseline, this value is treated as a deduction from total quantified savings.
[16] In the absence of having a baseline figure provided in the utility's most recently submitted 5-year water conservation plan, the historic 5-year average for water loss GPCD in the plan was used.
[17] Correspondence with utility staff.
[18] The study estimates a 2% demand reduction with 10% increase in price on a targeted customer class. By applying a ratio, it is possible to determine the savings for lower or higher percentage increases.

5 Summary of Savings

6 Suggested Activities

Up to four activities were chosen as potential suggested activities for individual reports. These activities are: AMI system with customer portal, twice-per-week (or less) outdoor watering ordinances, strategic water rate increases, and rain barrels.

Activities were chosen because they are:

- Achievable
- Prevalence of vendors that can actually implement them
- Acceptability to city councils, MUD boards, et al.
- Easily adopted
- Cost effective
- Yield high savings relative to cost

AMI systems with customer engagement portals were also chosen because they represent a profusion of future applications that will undoubtedly continue to advance conservation efforts. AMI and meter data management (MDM) companies are developing new and innovative ways to benefit water providers, customers, and ultimately states that are pushing conservation and usage analytics further.

Each utility should be cognizant of the potential impact that these suggested activities may have on its own unique rate and revenue situation.

Benefits to consider:

- Avoided water supply and wastewater costs
  - The higher water purchase, transmission, and distribution costs are, the greater the potential benefit realized when large amounts of water are conserved with these activities.
- Avoided system expansion costs
  - Conserving water may allow a utility to postpone building new system capacity by decreasing demand even as population grows.

Costs to consider:

- Staff time and resources
- Unit cost per unit saved
- Implementation costs
- Stakeholder agreement and support
- Other overhead and budget considerations

6.1 Suggested Activities with Savings Estimates

1. Twice-a-week Outdoor Watering Restriction Ordinance
    a. Potentially 5.05% savings of total demand (Hermitte and Mace, 2012; Sierra Club-Lone Star Chapter and National Wildlife Federation, 2015)
        i. Average Region M savings
        ii. Specific percentage of outdoor usage unknown for your utility at this time
    b. Savings could be 85 MG per year with current demand.
    c. See Table 6-1 for potential savings from this measure compared with the city's WMS supply volumes targets.

Table 6-1. Current Savings + Potential Savings from 2x per Week Watering Ordinance (MG).

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Potential Savings from Ordinance	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)
2016	27	51	78	85	0	0	0	163
2017	28	53	80	87	0	0	0	167
2018	28	54	82	89	0	0	0	171
2019	29	56	84	91	0	0	0	175
2020	29	57	86	93	0	0	0	179
2021	30	58	88	94	0	0	0	183
2022	31	60	90	96	0	0	0	187
2023	31	61	92	98	0	0	0	191
2024	32	63	94	100	0	0	0	194
2025	32	64	96	102	0	0	0	198
2026	33	65	98	104	0	0	0	202
2027	34	67	100	106	0	0	0	206
2028	34	68	102	108	0	0	0	210
2029	35	69	104	110	0	0	0	214
2030	35	71	106	111	0	0	0	218
2031	36	72	108	113	4	0	4	217
2032	37	74	110	115	9	0	9	217
2033	37	75	112	117	13	0	13	217
2034	38	76	114	119	17	0	17	216
2035	38	78	116	121	21	0	21	216
2036	39	79	118	123	26	0	26	216
2037	40	81	120	125	30	0	30	216
2038	40	82	122	127	34	0	34	215
2039	41	83	124	129	38	0	38	215
2040	42	85	126	131	43	0	43	215

2. Advanced Metering Infrastructure with Customer Engagement Portal

These portals, along with mobile applications and billing statements, can provide customers with much more access to their water use data in simple and compelling formats. This access and comparison with other customers' usage can reduce water use through changed behavior, as well as provide an opportunity for other conservation programs to be offered to the customer for increased adoption and additional savings. AMI systems support leak notification and web portals with real-time data. Any water loss reduction savings that these systems also yield were included in the water loss assessment of individual reports for this project.

- **a.** Specific utility results will vary based on portal features and frequency of customer notifications
- **b.** Potential savings estimate assumes 20% of residential customers will use and save water due to the portal (Westin Engineering, 2015)
- **c.** Estimate assumes customers will save 10% of total annual use due to the portal
    - i. Savings estimate of 10% is an average of results from multiple studies (Chesnutt and Mitchell, 2013; East Bay Municipal Utility District, 2014; IBM, 2011; Texas A&M and Texas Water Resources Institute, 2016; Westin Engineering, 2015)
- **d.** Residential customers' use assumed to make up approximately 67% of all retail customers' use based on utility profile information submitted to the TWDB
    - i. This was the most common percentage of residential use among participating utilities in this project.
    - ii. Actual customer class demand percentages will vary by utility.
- **e.** 20% of residential customers saving 10% with this customer class breakdown amounts to 1.34% of total demand
- **f.** Savings are assumed to increase along with demand as connections increase each year[19]
- **g.** See Table 6-2 for potential savings from this measure compared with the utility’s WMS supply volumes targets.

[19] The 10% consumption reduction figure for 20% of residential customers is conservative, but savings could be greater when monitored yearly as customer engagement increases.

Table 6-2. Current Savings + Potential Savings from AMI with Customer Portal (MG).

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Potential Savings from AMI with Customer Portal	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)
2016	27	51	78	23	0	0	0	101
2017	28	53	80	23	0	0	0	103
2018	28	54	82	24	0	0	0	106
2019	29	56	84	24	0	0	0	108
2020	29	57	86	25	0	0	0	111
2021	30	58	88	25	0	0	0	113
2022	31	60	90	26	0	0	0	116
2023	31	61	92	26	0	0	0	118
2024	32	63	94	27	0	0	0	121
2025	32	64	96	27	0	0	0	123
2026	33	65	98	28	0	0	0	126
2027	34	67	100	28	0	0	0	128
2028	34	68	102	29	0	0	0	131
2029	35	69	104	29	0	0	0	133
2030	35	71	106	30	0	0	0	136
2031	36	72	108	30	4	0	4	134
2032	37	74	110	31	9	0	9	132
2033	37	75	112	31	13	0	13	131
2034	38	76	114	32	17	0	17	129
2035	38	78	116	32	21	0	21	127
2036	39	79	118	33	26	0	26	125
2037	40	81	120	33	30	0	30	124
2038	40	82	122	34	34	0	34	122
2039	41	83	124	34	38	0	38	120
2040	42	85	126	35	43	0	43	118

3. Rain Barrels
  - **a.** In Region M, utilities could save approximately 13.1 gallons per year per gallon of capacity rebated, sold, or distributed (GDS Associates, 2002).
  - **b.** Estimated 10-year useful life for most barrels

Statewide Water Conservation Quantification Project
East Rio Hondo WSC Report • 2017

1 Introduction

In Texas' 2017 State Water Plan, municipal water conservation is projected to meet 9.6 percent[1] of the state's future water needs by 2070. According to the 16 regional water plans that comprise the state water plan, this is expected to be achieved through a variety of measures such as installation of water efficient plumbing fixtures, water conservation pricing structures, water system audits, landscape irrigation ordinances, as well as other water conservation activities. The 9.6 percent is "in addition to the estimated share of future passive conservation savings from plumbing codes and water efficiency standards, which are embedded in municipal water demand projections" (Texas Water Development Board, 2017).

In 2015, the Texas Legislature appropriated funds to the Texas Water Development Board (TWDB) to fund a research project principally charged with quantitatively determining the savings of municipal water conservation activities being implemented in relation to the recommended conservation goals (supply volumes) in the State Water Plan. As part of the project, individual reports were completed for all participating utilities.

With this report, utilities will benefit by receiving a clear and concise picture of its water conservation goals alongside estimated savings from quantifiable activities. In the event that current activity savings may not be able to reach long-term goals, this report offers suggestions on how utilities can reach water conservation goals with activities that are effective, easily adopted, have widespread appeal, and are quantifiable.

2 Municipal Conservation Terminology and Review of Methodology Used by Regional Planners

To make use of the results of this study, it is important to understand several key terms used in the water planning process.

What is a water user group?

In this report, a water user group (WUG) refers to a retail water provider in the form a city, municipal utility district, water control and improvement district, special utility district, water supply corporation, fresh water supply district, or other type of water utility. The TWDB further defines WUGs as one of the following (Texas Water Development Board, 2016b):

- Cities and towns with a population of 500 or more
- Non-city utilities providing more than 280 acre-feet per year per year of water for municipal use
- Collective reporting units (CRUs) consisting of grouped utilities having a common association

[1] Equal to 811,224 acre-feet per year in conservation savings.

- County-Wide WUGs:
  - County-Other (Rural/unincorporated areas of municipal water use)
  - Manufacturing
  - Steam electric power generation

What is a recommended water management strategy?

A recommended water management strategy (WMS) is a measure that will help ensure WUGs have adequate water supplies for their end users well into the future. WMS examples include river diversions, groundwater use, reservoir and aquifer development, and irrigation conservation. When WMS is referred to in this report, it refers only to municipal conservation, which may include water loss reduction as a part of the same strategy.

What is a WMS supply volume?

A WMS supply volume is the amount of water that a given strategy is expected to yield each decade in the planning period if carried out by the WUG. In this report, a WMS supply volume is the amount of water recommended to come from municipal water conservation.

Some regional water plans separate this strategy's supply volume into a volume for municipal water conservation and a volume for water loss reduction for each decade. The total strategy supply volume is the sum of both. A regional water plan may also refer to "advanced conservation" as part of this strategy. Advanced conservation usually indicates that the volume could be achieved through a more robust mix of conservation activities described in the plan.

2.1 Regional Planning Group Approach to Determining Supply Volumes

Each regional water planning group (RWPG) is responsible for producing its own individual plan that, if executed, will provide sufficient water to its WUGs throughout a 50-year planning period. These plans are completed in five-year cycles, with the most recent edition being completed in 2016. The 2016 regional plans make up the 2017 State Water Plan, which sets out WMS supply volumes for the years 2020 through 2070.

The decadal WMS supply volumes for municipal conservation were established by each of the RWPGs in much the same manner. The RWPGs generally followed the guidelines of the Texas Legislature's Water Conservation Implementation Task Force on the pace utilities should target to reduce gallons per capita per day (GPCD)[2] consumption levels.

The targeted reductions used by most regions follow this formula:

- For municipal WUGs with water use of 140 GPCD and greater, the goal is to reduce per capita water use by one percent per year until the level of 140 GPCD is reached,

[2] Regional water planning GPCD is defined as the annual volume of water pumped, diverted, or purchased minus the volume exported (sold) to other water systems or large industrial facilities divided by the permanent resident population of the Municipal Water User Group in the regional water planning process divided by 365. Saline and reused/recycled water are not included in this volume (Texas Water Development Board, 2012).

after which, the goal is to reduce per capita water use by one-fourth percent per year for the remainder of the planning period (Texas Water Development Board, 2015j).

The yearly reductions in GPCD for a given WUG are then converted into recommended supply volumes in acre-feet per year for each decade as the reductions in consumption continue. Some regions reduce GPCD by slightly different percentages before and after the 140 GPCD threshold, some do not apply further reductions in GPCD for WUGs once they reach 140 GPCD, while others recommend only "advanced conservation" activities once WUGs meet 140 GPCD.

2.2 Methodology

In order to complete a uniform quantification process, the first engagement was with utilities that agreed to participate and collected as much relevant data as possible. These data included, among many others, historical GPCD consumption figures, advanced metering infrastructure (AMI) specifications, and detailed feedback on each conservation activity being implemented. Personal interviews focused on determining when and to what extent these activities were being employed, as well as assessing plans to continue such conservation. Examples of frequently implemented activities include tiered water rate conservation pricing, strategic water rate increases, outdoor irrigation audits and ordinances, and rain barrel distribution.

Subsequently, each utility's conservation activities were quantified through several different means, including evidence-based studies, utility field results and savings determinations, manufacturer guarantees, water loss audits, TWDB studies, and other information that assigned a savings value to the activity's implementation.

Every conservation activity studied and quantified has a gallons-per-year estimate, useful life, and decay rate (if applicable) associated with it. Some activities' savings are projected to grow as demand grows over time, while some savings are constant each year and subside once useful life has run its course. For expanded methodology and details on studies and formulas used to determine activity savings, refer to Section 6 of the State Report included as part of this document.

Once analyzed, the resulting savings estimates from each utility were compared with the recommended WMS supply volumes in its respective regional plan to determine if the savings met, exceeded, or fell short of those volumes. Individual utility savings were aggregated to compare with regional volumes, and regional savings were aggregated to compare with state volumes.

It is important to note that this report quantified activity savings—not including water loss reduction—for the WMS supply volume comparison dating back to 2012. The reason for this is, with a few exceptions, the regional planners used 2011 as the base year for establishing potential WMS supply volumes.[3] In addition, any conservation savings achieved through 2011 are assumed to be accounted for in the regional water planning GPCD for that year.[4] Thus, quantifying from 2012 and forward is the most accurate way to determine if utilities are meeting

[3] Confirmed via personal communication with Region C, H, K, and L Plan consultants.
[4] It was established with TWDB planning staff that 2011 GPCD levels were chosen because they represented the most current water use and conservation patterns at the time.

the recommended conservation volumes in the regional plans. This assumption is by no means 100 percent accurate, however. Some previously implemented activities' savings persist into future years beyond this starting point, while some activities' savings have ceased. One year's GPCD will not necessarily include all savings yielded by conservation activities that came before it, but the quantification assessment must have a starting point.

2.3 Quantifiable Savings

The key to the project being useful and reliable is that the results from year to year are measurable. Quantifying conservation activities that can be accurately measured provides greater certainty and better planning for all stakeholders.

While many utilities are engaged in a variety of conservation activities, not all can currently be properly measured. Some examples of these activities include education initiatives, website and social media engagement, and enforcement for water waste. That does not mean these measures are not essential. Education of consumers, for example, is a fundamental activity that makes all others effective, but little hard data exists to quantify the results of education alone.

In addition, the work of conservation coordinators can have a particularly significant effect on the savings of all other activities, but the specific savings attributed to that staff role is difficult to quantify.

3 Results

This report compares East Rio Hondo WSC's current water conservation activities and their quantified savings to two metrics: 1) Region M Water Plan's (Texas Water Development Board, 2016k) recommended WMS supply volumes for municipal conservation, and 2) East Rio Hondo WSC's own 5- and 10-year goals as established in its most recent water conservation plan submitted to the TWDB.

The WMS supply volumes for municipal water conservation are laid out by decade (2020 – 2070) in the regional water plans to serve as benchmarks for what each utility could achieve via that strategy during a 50-year planning period.[5]

The 5- and 10-year goals in East Rio Hondo WSC's most recent water conservation plan are established by the utility as realistic targets for reducing consumption over that timeframe. These reductions[6] are expressed in decreasing total GPCD [7] consumption and water loss GPCD.[8] [9]

---

[5] Some regional water plans separate this strategy volume into a volume for water conservation and a volume for water loss reduction for each decade. The total strategy volume is the sum of both.

[6] Occasionally, some utilities expect consumption to increase due to various reasons, such as an incoming industrial presence expected to raise consumption figures for the entire service area.

[7] As defined in TWDB water conservation plan annual report (Texas Water Development Board, 2016o): (Total Gallons in System ÷ Permanent Population) ÷ 365

[8] These plans also have targets for residential GPCD and water loss as a percentage (rather than GPCD), but this report does not address those goals.

[9] As defined in TWDB water conservation plan annual report (Texas Water Development Board, 2016o): (Total Water Loss ÷ Permanent Population) ÷ 365

The estimated savings in Tables 3-1 through 3-3 indicate the best information available as provided by utility staff. Some ongoing activities may not be known and are within a utility's service area are implemented on a micro-scale that may not be quantified. Individual households and businesses may be implementing conservation measures that are unknown and therefore cannot be included in the report.

Explanation of approach to assessing water loss reduction savings

Water loss reduction savings are defined as the volume of water participating utilities are realizing from their water loss mitigation efforts. For this report, this value is the difference between each individual utility's baseline[10] for water loss GPCD and its most recent water loss GPCD reported in 2015 water loss audits on file with TWDB. Savings from all water loss reduction efforts—including pipe replacements and leak repair—are assumed to be included in this comparison to a utility's baseline.

Note that because a single year (2015) value was used for comparison, it is possible that the 2015 value could be anomalous due to a number of events that may have occurred that year, such as a water main break, a particularly wet year, or a robust effort by the utility to curtail water loss. This will distort future savings figures that were carried forward in the study because water loss will inevitably increase or decrease in later years.

Ideally, using a rolling five-year average in the calculation would correct such anomalies. However, there was insufficient data to do that for every utility. The approach was to use the most complete water loss data possible, which was represented by the 2015 water loss audit. This problem will be further minimized, as continued data collection will allow five-year averages to be calculated for a majority of utilities.

In this way, water loss savings estimates are different from all other activity savings estimates in the project. Whether savings were positive or negative depended on where individual utilities established their own baselines or where their five-year average started, and what water loss GPCD value was reported in 2015.

3.1 Current Savings Compared to Conservation WMS Supply Volume (in million gallons) in Regional Water Plan

Table 3-1 shows the 2070 outlook for East Rio Hondo WSC with the utility's yearly recommended WMS supply volume in million gallons (MG) alongside its water savings from implemented activities, including from water loss reduction. These activities and their associated savings are covered in greater detail in Sections 4 and 5.

Starting in 2015, this table compares all quantified conservation activity and the recommended conservation WMS supply volume for the planning period. The following definitions pair with the column headers in Table 3-1.

[10] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.

Actual Current Conservation Activity Savings – All quantified activities currently being performed by the utility, *excluding* savings from water loss reduction. The regional planners used 2011 GPCD as the baseline for determining future conservation WMS supply volumes, therefore the study quantifies utility savings starting in 2012 for this comparison. The summary of these savings can be referenced in Table 5-1.

Actual Water Loss Reduction Savings (as of 2015) – The difference between the baseline[11] for water loss GPCD and most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB. [12] The summary of these savings can be referenced in Table 5-2.

Total Savings from All Conservation Activity – Actual Current Conservation Activity Savings plus Actual Water Loss Reduction Savings (as of 2015).

Conservation WMS Volume – The recommended municipal water conservation supply volume in the regional plan for the decades ranging from 2020 to 2070. These volumes are converted to MG from the values listed in the plan in acre-feet and then calculated in annual increments.

Water Loss Reduction WMS Volume – Some regional water plans have a separate WMS volume for water conservation and for water loss reduction for each decade. If a WUG's regional plan has a WMS volume for water loss reduction, this column will have values other than zero.

Total Yearly WMS Volume – The sum of the Conservation WMS Volume and Water Loss Reduction WMS Volume.

Over (Short) – The amount that the utility's Total Savings from All Conservation Activity (since 2012), is over or below the Total Yearly WMS Volume in the regional water plan. If the amount falls below the WMS volume, it will appear in parentheses.

---

[11] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.
[12] If water loss GPCD has increased from the utility's baseline or historic five-year average to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount.

Table 3-1. Current Savings Compared to Conservation WMS Supply Volume (MG) in Regional Water Plan.

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)
2015	13	25	38	0	0	0	38

2067	49	56	104	358	0	358	(254)
2068	49	56	106	371	0	371	(265)
2069	50	57	107	383	0	383	(277)
2070	50	57	108	396	0	396	(288)

3.2 Utility Water Conservation Plan Goals – Total GPCD

Table 3-2 shows how East Rio Hondo WSC's quantified savings from its implemented activities compare with 5- and 10-year goals established in its individual water conservation plan submitted to the TWDB. The following definitions pair with the column headers in Table 3-2.

Utility Population – Estimated utility service area population for the years indicated.

Total GPCD Goals – Total GPCD goals start with the utility's baseline[13] for total GPCD and progress in subsequent years to match 5- and 10-year goals indicated in a utility's five-year water conservation plan on file with the TWDB. The first five annual GPCD goals were developed by spreading the difference between the baseline and five-year goal evenly over five years. The second five annual GPCD goals spread the difference between the five-year goal and 10-year goal evenly over the next five years.

Annual Savings Goal with Reduction in GPCD (MG) – This column shows what reductions from the baseline GPCD would yield in terms of volume each year as more water is saved. The volumes indicated here are what target GPCD goals look like expressed in million gallons. Annual volumes were derived using the formula: (baseline total GPCD – target total GPCD for that year) x 365 days ÷ 1,000,000 gallons.

Total Savings for All Current Quantified Activities (MG) – Total quantified savings for all current conservation activities and savings from water loss reduction. Refer to Tables 5-1 and 5-2 for details on these savings.

Over (Short) – The amount that the utility's total quantified savings for all current conservation activities (since 2012), including water loss reduction, is over or below the volume represented by reductions in GPCD each year. If the quantified savings are less than these target volumes, the value will appear in parentheses.

Table 3-2. Utility Water Conservation Plan Goals — Total GPCD.

Year #	Year	Utility Population	Total GPCD Goals	Annual Savings Goal with Reduction in GPCD (MG)	Total Savings for All Current Quantified Activities (MG)	Over (Short) (MG)
0	**Baseline**	-	110	0	0	0
1	2015	22,878	108	17	38	22
2	2016	23,789	106	35	52	17
3	2017	24,701	104	54	54	(1)
4	2018	25,612	102	75	55	(20)
5-year Goal	2019	26,524	100	97	56	(40)
6	2020	27,435	99	110	58	(52)
7	2021	27,897	98	122	59	(64)
8	2022	28,358	97	135	60	(75)
9	2023	28,820	96	147	60	(87)
10-year Goal	2024	29,282	95	160	61	(99)

[13] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for total GPCD from the utility's most recently submitted five-year water conservation plan was used.

3.3 Utility Water Conservation Plan Goals – Water Loss GPCD

Table 3-3 shows how East Rio Hondo WSC's most recent water loss audit compares with five- and 10-year water loss goals in its water conservation plan. The following definitions pair with the column headers in Table 3-2.

Utility Population – Estimated utility service area population for the years indicated.

Water Loss GPCD Goals – Water loss GPCD goals start with the utility's baseline[14] for water loss GPCD and progress in subsequent years to match 5- and 10-year water loss goals indicated in a utility's five-year water conservation plan on file with the TWDB. The first five annual GPCD goals were developed by spreading the difference between the baseline and five-year goal evenly over five years. The second five annual GPCD goals spread the difference between the five-year goal and 10-year goal evenly over the next five years.

Yearly Savings Goal with Reduction in GPCD (MG) – This column shows what reductions from the baseline water loss GPCD would yield in terms of volume each year as more water is saved. The volumes indicated here are what target water loss GPCD goals look like expressed in million gallons. Annual volumes were derived using the formula: (baseline water loss GPCD – target water loss GPCD for that year) x 365 days ÷ 1,000,000 gallons.

Total Savings from Water Loss Reduction (MG) – The difference between a utility's established baseline for water loss GPCD and the most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB. If water loss GPCD has increased from the utility's baseline to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount. Reference Table 5-2 for savings from water loss reduction.

Over (Short) – The amount that the utility's total savings from water loss reduction is over or below the volume represented by reductions in GPCD each year. If water loss reduction savings are less than these target volumes, the value will appear in parentheses.

Table 3-3. Utility Water Conservation Plan Goals — Water Loss GPCD.

Year #	Year	Utility Population	Water Loss GPCD Goals	Yearly Savings Goal with Reduction in GPCD (MG)	Total Savings from Water Loss Reduction (MG)	Over (Short) (MG)
0	**Baseline**	-	16.00	0	0	0
1	2015	22,878	15.80	2	25	23
2	2016	23,789	15.60	3	26	23
3	2017	24,701	15.40	5	27	22
4	2018	25,612	15.20	7	28	21
5-year Goal	2019	26,524	15.00	10	29	19
6	2020	27,435	14.00	20	30	10
7	2021	27,897	13.00	31	31	0
8	2022	28,358	12.00	41	31	(10)
9	2023	28,820	11.00	53	32	(21)
10-year Goal	2024	29,282	10.00	64	32	(32)

[14] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.

4 Implemented Activities

Below is a list of completed activities with estimated water savings. Note that drought response and other measures are not included in the utility's water savings because they are temporary, awareness-based or not able to be accurately quantified on an annual basis.

These are not savings projections of potential future activities. Estimated savings are based on measures that have actually been implemented. If savings are shown to persist in future years, it is because the measure is permanent, such as an ordinance, or the savings are assumed to continue for the reason listed under the itemized activity. Estimated savings from water rate increases are the one exception to these conditions.

Water Rate Increases

Savings from water rate increases were included because entities such as the U.S. Environmental Protection Agency and others indicate specific savings for utilities that raise rates (Texas Water Development Board, 2013; U.S. E.P.A., 1998; Whitcomb, 1999). This project includes surveys of several utilities that have minimal education efforts, perform no other substantive conservation activities, and yet experienced significant demand reduction that coincided with rate increases. In those cases, savings estimates matched up closely with decreases in total GPCD. For many smaller utilities, especially those with customers lacking disposable income, this measure is the only tool used to conserve other than water loss reduction.

The following assumptions were made for water rate increases:

- The model assumes that savings persist into future years because it is expected that the utility will continue to make periodic rate increases in line with the percentage increases from previous years.
- Only the last two rate increases for a utility were quantified.
- Savings grow with demand because as new customers enter the service area, they are assumed to adhere to the same price elasticity model estimates.
- A weighted average for savings was used when rate increases differed between residential and industrial-commercial-institutional (ICI) customers based on the individual utility's customer class breakdown.
- When a utility raised rates using tiered rate conservation pricing, a 50/50 savings split was used when increases differed between base and volumetric rates.
    - The reasoning is that all customers must react to the base increase, yet the pricing signal is stronger when volumetric rate increases affect the higher usage customers.
    - The 50/50 split is reasonable because many customers will not reach the higher volumetric tiers.
    - Studies show that most customers do not actually know they have reached the higher volumetric tiers; just that their bill has increased (Texas Water Development Board, 2013).

4.1 Itemized Activities

1. **Utility Website**
    a. Easy-to-use website with conservation tips and water rates
    b. Features contact information for Public Works staff and customer service

2. **Continuing Public Education**
    a. The utility engages the public in many ways including:
        i. Brochures, bill messages, displays, and exhibits

3. **Water Loss Reduction Savings**[15]
    a. Savings of 25 MG annually in 2015
    b. Water loss reduction savings = the difference between a utility's baseline[16] water loss GPCD submitted in its most recent 5-year water conservation plan and its most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB
    c. If water loss GPCD has increased from the utility's baseline or historic 5-year average to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount.
    d. All savings estimates grow each year at the same rate population figures for the utility grow in the regional water plan.

4. **Water Rate Increases**
    a. Last rate increases:[17]
        i. 5.7% increase in 2014
        ii. 5.4% increase in 2016
    b. Estimated customer demand reduction of 2.22%
    c. Savings is cumulative and based on more than one source[18] (U.S. EPA, 1998; Whitcomb, 1999)
    d. Savings from rate increases are shown to persist over time, however, note that savings from these pricing signals will likely decrease if rates remain the same in future years.

---

[15] If current water loss levels exceed a utility's baseline, this value is treated as a deduction from total quantified savings.
[16] In the absence of having a baseline figure provided in the utility's most recently submitted 5-year water conservation plan, the historic 5-year average for water loss GPCD in the plan was used.
[17] Correspondence with utility staff.
[18] The study estimates a 2% demand reduction with 10% increase in price on a targeted customer class. By applying a ratio, it is possible to determine the savings for lower or higher percentage increases.

5 Summary of Savings

Table 5-1. Savings by Water Conservation Activity (MG).

Year	Water Rate Increases	TOTAL SAVINGS
2014	13.0	13
2015	13.2	13
2016	26.1	26
2017	26.5	26
2018	26.9	27
2019	27.3	27
2020	27.7	28
2021	28.1	28
2022	28.5	28
2023	28.9	29
2024	29.3	29
2025	29.7	30
2026	30.1	30

2023	28,820	13.00	32
2024	29,282	13.00	32

6 Suggested Activities

Up to four activities were chosen as potential suggested activities for individual reports. These activities are: AMI system with customer portal, twice-per-week (or less) outdoor watering ordinances, strategic water rate increases, and rain barrels.

Activities were chosen because they are:

- Achievable
- Prevalence of vendors that can actually implement them
- Acceptability to city councils, MUD boards, et al.
- Easily adopted
- Cost effective
- Yield high savings relative to cost

AMI systems with customer engagement portals were also chosen because they represent a profusion of future applications that will undoubtedly continue to advance conservation efforts. AMI and meter data management (MDM) companies are developing new and innovative ways to benefit water providers, customers, and ultimately states that are pushing conservation and usage analytics further.

Each utility should be cognizant of the potential impact that these suggested activities may have on its own unique rate and revenue situation.

Benefits to consider:

- Avoided water supply and wastewater costs
    - The higher water purchase, transmission, and distribution costs are, the greater the potential benefit realized when large amounts of water are conserved with these activities.
- Avoided system expansion costs
    - Conserving water may allow a utility to postpone building new system capacity by decreasing demand even as population grows.

Costs to consider:

- Staff time and resources
- Unit cost per unit saved
- Implementation costs
- Stakeholder agreement and support
- Other overhead and budget considerations

6.1 Suggested Activities with Savings Estimates

1. Twice-a-week Outdoor Watering Restriction Ordinance
   a. Potentially 5.05% savings of total demand (Hermitte and Mace, 2012; Sierra Club-Lone Star Chapter and National Wildlife Federation, 2015)
      i. Average Region M savings
      ii. Specific percentage of outdoor usage unknown for your utility at this time
   b. Savings could be 59 MG per year with current demand.
   c. See Table 6-1 for potential savings from this measure compared with the city's WMS supply volumes targets.

Table 6-1. Current Savings + Potential Savings from 2x per Week Watering Ordinance (MG).

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Potential Savings from Ordinance	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)

2. Advanced Metering Infrastructure with Customer Engagement Portal

These portals, along with mobile applications and billing statements, can provide customers with much more access to their water use data in simple and compelling formats. This access and comparison with other customers' usage can reduce water use through changed behavior, as well as provide an opportunity for other conservation programs to be offered to the customer for increased adoption and additional savings. AMI systems support leak notification and web portals with real-time data. Any water loss reduction savings that these systems also yield were included in the water loss assessment of individual reports for this project.

- **a.** Specific utility results will vary based on portal features and frequency of customer notifications
- **b.** Potential savings estimate assumes 20% of residential customers will use and save water due to the portal (Westin Engineering, 2015)
- **c.** Estimate assumes customers will save 10% of total annual use due to the portal
  - i. Savings estimate of 10% is an average of results from multiple studies (Chesnutt and Mitchell, 2013; East Bay Municipal Utility District, 2014; IBM, 2011; Texas A&M and Texas Water Resources Institute, 2016; Westin Engineering, 2015)
- **d.** Residential customers' use assumed to make up approximately 67% of all retail customers' use based on utility profile information submitted to the TWDB
  - i. This was the most common percentage of residential use among participating utilities in this project.
  - ii. Actual customer class demand percentages will vary by utility.
- **e.** 20% of residential customers saving 10% with this customer class breakdown amounts to 1.34% of total demand
- **f.** Savings are assumed to increase along with demand as connections increase each year[19]
- **g.** See Table 6-2 for potential savings from this measure compared with the utility's WMS supply volumes targets.

[19] The 10% consumption reduction figure for 20% of residential customers is conservative, but savings could be greater when monitored yearly as customer engagement increases.

Table 6-2. Current Savings + Potential Savings from AMI with Customer Portal (MG).

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Potential Savings from AMI with Customer Portal	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)

3. Rain Barrels

- **a.** In Region M, utilities could save approximately 13.1 gallons per year per gallon of capacity rebated, sold, or distributed (GDS Associates, 2002).
- **b.** Estimated 10-year useful life for most barrels

Statewide Water Conservation Quantification Project
City of Edinburg Report • 2017

1 Introduction

In Texas' 2017 State Water Plan, municipal water conservation is projected to meet 9.6 percent[1] of the state's future water needs by 2070. According to the 16 regional water plans that comprise the state water plan, this is expected to be achieved through a variety of measures such as installation of water efficient plumbing fixtures, water conservation pricing structures, water system audits, landscape irrigation ordinances, as well as other water conservation activities. The 9.6 percent is "in addition to the estimated share of future passive conservation savings from plumbing codes and water efficiency standards, which are embedded in municipal water demand projections" (Texas Water Development Board, 2017).

In 2015, the Texas Legislature appropriated funds to the Texas Water Development Board (TWDB) to fund a research project principally charged with quantitatively determining the savings of municipal water conservation activities being implemented in relation to the recommended conservation goals (supply volumes) in the State Water Plan. As part of the project, individual reports were completed for all participating utilities.

With this report, utilities will benefit by receiving a clear and concise picture of its water conservation goals alongside estimated savings from quantifiable activities. In the event that current activity savings may not be able to reach long-term goals, this report offers suggestions on how utilities can reach water conservation goals with activities that are effective, easily adopted, have widespread appeal, and are quantifiable.

2 Municipal Conservation Terminology and Review of Methodology Used by Regional Planners

To make use of the results of this study, it is important to understand several key terms used in the water planning process.

What is a water user group?

In this report, a water user group (WUG) refers to a retail water provider in the form a city, municipal utility district, water control and improvement district, special utility district, water supply corporation, fresh water supply district, or other type of water utility. The TWDB further defines WUGs as one of the following (Texas Water Development Board, 2016b):

- Cities and towns with a population of 500 or more
- Non-city utilities providing more than 280 acre-feet per year per year of water for municipal use
- Collective reporting units (CRUs) consisting of grouped utilities having a common association

[1] Equal to 811,224 acre-feet per year in conservation savings.

- County-Wide WUGs:
    - County-Other (Rural/unincorporated areas of municipal water use)
    - Manufacturing
    - Steam electric power generation

What is a recommended water management strategy?

A recommended water management strategy (WMS) is a measure that will help ensure WUGs have adequate water supplies for their end users well into the future. WMS examples include river diversions, groundwater use, reservoir and aquifer development, and irrigation conservation. When WMS is referred to in this report, it refers only to municipal conservation, which may include water loss reduction as a part of the same strategy.

What is a WMS supply volume?

A WMS supply volume is the amount of water that a given strategy is expected to yield each decade in the planning period if carried out by the WUG. In this report, a WMS supply volume is the amount of water recommended to come from municipal water conservation.

Some regional water plans separate this strategy's supply volume into a volume for municipal water conservation and a volume for water loss reduction for each decade. The total strategy supply volume is the sum of both. A regional water plan may also refer to "advanced conservation" as part of this strategy. Advanced conservation usually indicates that the volume could be achieved through a more robust mix of conservation activities described in the plan.

2.1 Regional Planning Group Approach to Determining Supply Volumes

Each regional water planning group (RWPG) is responsible for producing its own individual plan that, if executed, will provide sufficient water to its WUGs throughout a 50-year planning period. These plans are completed in five-year cycles, with the most recent edition being completed in 2016. The 2016 regional plans make up the 2017 State Water Plan, which sets out WMS supply volumes for the years 2020 through 2070.

The decadal WMS supply volumes for municipal conservation were established by each of the RWPGs in much the same manner. The RWPGs generally followed the guidelines of the Texas Legislature's Water Conservation Implementation Task Force on the pace utilities should target to reduce gallons per capita per day (GPCD)[2] consumption levels.

The targeted reductions used by most regions follow this formula:

- For municipal WUGs with water use of 140 GPCD and greater, the goal is to reduce per capita water use by one percent per year until the level of 140 GPCD is reached,

[2] Regional water planning GPCD is defined as the annual volume of water pumped, diverted, or purchased minus the volume exported (sold) to other water systems or large industrial facilities divided by the permanent resident population of the Municipal Water User Group in the regional water planning process divided by 365. Saline and reused/recycled water are not included in this volume (Texas Water Development Board, 2012).

after which, the goal is to reduce per capita water use by one-fourth percent per year for the remainder of the planning period (Texas Water Development Board, 2016j).

The yearly reductions in GPCD for a given WUG are then converted into recommended supply volumes in acre-feet per year for each decade as the reductions in consumption continue. Some regions reduce GPCD by slightly different percentages before and after the 140 GPCD threshold, some do not apply further reductions in GPCD for WUGs once they reach 140 GPCD, while others recommend only "advanced conservation" activities once WUGs meet 140 GPCD.

2.2 Methodology

In order to complete a uniform quantification process, the first engagement was with utilities that agreed to participate and collected as much relevant data as possible. These data included, among many others, historical GPCD consumption figures, advanced metering infrastructure (AMI) specifications, and detailed feedback on each conservation activity being implemented. Personal interviews focused on determining when and to what extent these activities were being employed, as well as assessing plans to continue such conservation. Examples of frequently implemented activities include tiered water rate conservation pricing, strategic water rate increases, outdoor irrigation audits and ordinances, and rain barrel distribution.

Subsequently, each utility's conservation activities were quantified through several different means, including evidence-based studies, utility field results and savings determinations, manufacturer guarantees, water loss audits, TWDB studies, and other information that assigned a savings value to the activity's implementation.

Every conservation activity studied and quantified has a gallons-per-year estimate, useful life, and decay rate (if applicable) associated with it. Some activities' savings are projected to grow as demand grows over time, while some savings are constant each year and subside once useful life has run its course. For expanded methodology and details on studies and formulas used to determine activity savings, refer to Section 6 of the State Report included as part of this document.

Once analyzed, the resulting savings estimates from each utility were compared with the recommended WMS supply volumes in its respective regional plan to determine if the savings met, exceeded, or fell short of those volumes. Individual utility savings were aggregated to compare with regional volumes, and regional savings were aggregated to compare with state volumes.

It is important to note that this report quantified activity savings—not including water loss reduction—for the WMS supply volume comparison dating back to 2012. The reason for this is, with a few exceptions, the regional planners used 2011 as the base year for establishing potential WMS supply volumes.[3] In addition, any conservation savings achieved through 2011 are assumed to be accounted for in the regional water planning GPCD for that year.[4] Thus, quantifying from 2012 and forward is the most accurate way to determine if utilities are meeting

[3] Confirmed via personal communication with Region C, H, K, and L Plan consultants.
[4] It was established with TWDB planning staff that 2011 GPCD levels were chosen because they represented the most current water use and conservation patterns at the time.

the recommended conservation volumes in the regional plans. This assumption is by no means 100 percent accurate, however. Some previously implemented activities' savings persist into future years beyond this starting point, while some activities' savings have ceased. One year's GPCD will not necessarily include all savings yielded by conservation activities that came before it, but the quantification assessment must have a starting point.

2.3 Quantifiable Savings

The key to the project being useful and reliable is that the results from year to year are measurable. Quantifying conservation activities that can be accurately measured provides greater certainty and better planning for all stakeholders.

While many utilities are engaged in a variety of conservation activities, not all can currently be properly measured. Some examples of these activities include education initiatives, website and social media engagement, and enforcement for water waste. That does not mean these measures are not essential. Education of consumers, for example, is a fundamental activity that makes all others effective, but little hard data exists to quantify the results of education alone.

In addition, the work of conservation coordinators can have a particularly significant effect on the savings of all other activities, but the specific savings attributed to that staff role is difficult to quantify.

3 Results

This report compares Edinburg's current water conservation activities and their quantified savings to two metrics: 1) Region M Water Plan's (Texas Water Development Board, 2016k) recommended WMS supply volumes for municipal conservation, and 2) Edinburg's own 5- and 10-year goals as established in its most recent water conservation plan submitted to the TWDB.

The WMS supply volumes for municipal water conservation are laid out by decade (2020 – 2070) in the regional water plans to serve as benchmarks for what each utility could achieve via that strategy during a 50-year planning period.[5]

The 5- and 10-year goals in Edinburg's most recent water conservation plan are established by the utility as realistic targets for reducing consumption over that timeframe. These reductions[6] are expressed in decreasing total GPCD[7] consumption and water loss GPCD.[8] [9]

The estimated savings in Tables 3-1 through 3-3 indicate the best information available as

[5] Some regional water plans separate this strategy volume into a volume for water conservation and a volume for water loss reduction for each decade. The total strategy volume is the sum of both.
[6] Occasionally, some utilities expect consumption to increase due to various reasons, such as an incoming industrial presence expected to raise consumption figures for the entire service area.
[7] As defined in TWDB water conservation plan annual report (Texas Water Development Board, 2016o): (Total Gallons in System ÷ Permanent Population) ÷ 365
[8] These plans also have targets for residential GPCD and water loss as a percentage (rather than GPCD), but this report does not address those goals.
[9] As defined in TWDB water conservation plan annual report (Texas Water Development Board, 2016o): (Total Water Loss ÷ Permanent Population) ÷ 365

provided by utility staff. Some ongoing activities may not be known and are within a utility's service area are implemented on a micro-scale that may not be quantified. Individual households and businesses may be implementing conservation measures that are unknown and therefore cannot be included in the report.

Explanation of approach to assessing water loss reduction savings

Water loss reduction savings are defined as the volume of water participating utilities are realizing from their water loss mitigation efforts. For this report, this value is the difference between each individual utility's baseline[10] for water loss GPCD and its most recent water loss GPCD reported in 2015 water loss audits on file with TWDB. Savings from all water loss reduction efforts—including pipe replacements and leak repair—are assumed to be included in this comparison to a utility's baseline.

Note that because a single year (2015) value was used for comparison, it is possible that the 2015 value could be anomalous due to a number of events that may have occurred that year, such as a water main break, a particularly wet year, or a robust effort by the utility to curtail water loss. This will distort future savings figures that were carried forward in the study because water loss will inevitably increase or decrease in later years.

Ideally, using a rolling five-year average in the calculation would correct such anomalies. However, there was insufficient data to do that for every utility. The approach was to use the most complete water loss data possible, which was represented by the 2015 water loss audit. This problem will be further minimized, as continued data collection will allow five-year averages to be calculated for a majority of utilities.

In this way, water loss savings estimates are different from all other activity savings estimates in the project. Whether savings were positive or negative depended on where individual utilities established their own baselines or where their five-year average started, and what water loss GPCD value was reported in 2015.

3.1 Current Savings Compared to Conservation WMS Supply Volume (in million gallons) in Regional Water Plan

Table 3-1 shows the 2070 outlook for Edinburg with the utility's yearly recommended WMS supply volume in million gallons (MG) alongside its water savings from implemented activities, including from water loss reduction. These activities and their associated savings are covered in greater detail in Sections 4 and 5.

Starting in 2015, this table compares all quantified conservation activity and the recommended conservation WMS supply volume for the planning period. The following definitions pair with the column headers in Table 3-1.

<u>Actual Current Conservation Activity Savings</u> – All quantified activities currently being performed by the utility, *excluding* savings from water loss reduction. The regional planners used

---

[10] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.

2011 GPCD as the baseline for determining future conservation WMS supply volumes, therefore the study quantifies utility savings starting in 2012 for this comparison.

<u>Actual Water Loss Reduction Savings (as of 2015)</u> – The difference between the baseline[11] for water loss GPCD and most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB. [12] The summary of these savings can be referenced in Table 5-1.

<u>Total Savings from All Conservation Activity</u> – Actual Current Conservation Activity Savings plus Actual Water Loss Reduction Savings (as of 2015).

<u>Conservation WMS Volume</u> – The recommended municipal water conservation supply volume in the regional plan for the decades ranging from 2020 to 2070. These volumes are converted to MG from the values listed in the plan in acre-feet and then calculated in annual increments.

<u>Water Loss Reduction WMS Volume</u> – Some regional water plans have a separate WMS volume for water conservation and for water loss reduction for each decade. If a WUG's regional plan has a WMS volume for water loss reduction, this column will have values other than zero.

<u>Total Yearly WMS Volume</u> – The sum of the Conservation WMS Volume and Water Loss Reduction WMS Volume.

<u>Over (Short)</u> – The amount that the utility's Total Savings from All Conservation Activity (since 2012), is over or below the Total Yearly WMS Volume in the regional water plan. If the amount falls below the WMS volume, it will appear in parentheses.

[11] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.
[12] If water loss GPCD has increased from the utility's baseline or historic five-year average to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount.

Table 3-1. Current Savings Compared to Conservation WMS Supply Volume (MG) in Regional Water Plan.

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)

3.2 Utility Water Conservation Plan Goals – Total GPCD

Table 3-2 shows how Edinburg's quantified savings from its implemented activities compare with 5- and 10-year goals established in its individual water conservation plan submitted to the TWDB. The following definitions pair with the column headers in Table 3-2.

Utility Population – Estimated utility service area population for the years indicated.

Total GPCD Goals – Total GPCD goals start with the utility's baseline[13] for total GPCD and progress in subsequent years to match 5- and 10-year goals indicated in a utility's five-year water conservation plan on file with the TWDB. The first five annual GPCD goals were developed by spreading the difference between the baseline and five-year goal evenly over five years. The second five annual GPCD goals spread the difference between the five-year goal and 10-year goal evenly over the next five years.

Annual Savings Goal with Reduction in GPCD (MG) – This column shows what reductions from the baseline GPCD would yield in terms of volume each year as more water is saved. The volumes indicated here are what target GPCD goals look like expressed in million gallons. Annual volumes were derived using the formula: (baseline total GPCD – target total GPCD for that year) x 365 days ÷ 1,000,000 gallons.

Total Savings for All Current Quantified Activities (MG) – Total quantified savings for all current conservation activities and savings from water loss reduction.

Over (Short) – The amount that the utility's total quantified savings for all current conservation activities (since 2012), including water loss reduction, is over or below the volume represented by reductions in GPCD each year. If the quantified savings are less than these target volumes, the value will appear in parentheses.

Table 3-2. Utility Water Conservation Plan Goals — Total GPCD.

Year #	Year	Utility Population	Total GPCD Goals	Annual Savings Goal with Reduction in GPCD (MG)	Total Savings for All Current Quantified Activities (MG)	Over (Short) (MG)
0	**Baseline**	-	134	0	0	0
1	2015	84,497	127	210	247	37
2	2016	87,140	120	433	254	(178)
3	2017	89,783	114	669	262	(406)
4	2018	92,425	107	918	270	(648)
5-year Goal	2019	95,068	100	1,180	278	(902)
6	2020	97,711	98	1,284	285	(999)
7	2021	100,073	96	1,388	292	(1,096)
8	2022	102,435	94	1,496	299	(1,196)
9	2023	104,796	92	1,607	306	(1,301)
10-year Goal	2024	107,158	90	1,721	313	(1,408)

[13] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for total GPCD from the utility's most recently submitted five-year water conservation plan was used.

3.3 Utility Water Conservation Plan Goals – Water Loss GPCD

Table 3-3 shows how Edinburg's most recent water loss audit compares with 5- and 10-year water loss goals in its water conservation plan. The following definitions pair with the column headers in Table 3-2.

Utility Population – Estimated utility service area population for the years indicated.

Water Loss GPCD Goals – Water loss GPCD goals start with the utility's baseline[14] for water loss GPCD and progress in subsequent years to match 5- and 10-year water loss goals indicated in a utility's five-year water conservation plan on file with the TWDB. The first five annual GPCD goals were developed by spreading the difference between the baseline and five-year goal evenly over five years. The second five annual GPCD goals spread the difference between the five-year goal and 10-year goal evenly over the next five years.

Yearly Savings Goal with Reduction in GPCD (MG) – This column shows what reductions from the baseline water loss GPCD would yield in terms of volume each year as more water is saved. The volumes indicated here are what target water loss GPCD goals look like expressed in million gallons. Annual volumes were derived using the formula: (baseline water loss GPCD – target water loss GPCD for that year) x 365 days ÷ 1,000,000 gallons.

Total Savings from Water Loss Reduction (MG) – The difference between a utility's established baseline for water loss GPCD and the most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB. If water loss GPCD has increased from the utility's baseline to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount. Reference Table 5-1 for savings from water loss reduction.

Over (Short) – The amount that the utility's total savings from water loss reduction is over or below the volume represented by reductions in GPCD each year. If water loss reduction savings are less than these target volumes, the value will appear in parentheses.

Table 3-3. Utility Water Conservation Plan Goals — Water Loss GPCD.

Year #	Year	Utility Population	Water Loss GPCD Goals	Yearly Savings Goal with Reduction in GPCD (MG)	Total Savings from Water Loss Reduction (MG)	Over (Short) (MG)
0	**Baseline**	-	12.00	0	0	0
1	2015	84,497	11.00	31	247	216
2	2016	87,140	10.00	64	254	191
3	2017	89,783	9.00	98	262	164
4	2018	92,425	8.00	135	270	135
5-year Goal	2019	95,068	7.00	173	278	104
6	2020	97,711	6.60	193	285	93
7	2021	100,073	6.20	212	292	80
8	2022	102,435	5.80	232	299	67
9	2023	104,796	5.40	252	306	54
10-year Goal	2024	107,158	5.00	274	313	39

[14] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.

4 Implemented Activities

Below is a list of completed activities with estimated water savings. Note that drought response and other measures are not included in the utility's water savings because they are temporary, awareness-based or not able to be accurately quantified on an annual basis.

These are not savings projections of potential future activities. Estimated savings are based on measures that have actually been implemented. If savings are shown to persist in future years, it is because the measure is permanent, such as an ordinance, or the savings are assumed to continue for the reason listed under the itemized activity. Estimated savings from water rate increases are the one exception to these conditions.

Water Rate Increases

Savings from water rate increases were included because entities such as the U.S. Environmental Protection Agency and others indicate specific savings for utilities that raise rates (Texas Water Development Board, 2013; U.S. E.P.A., 1998; Whitcomb, 1999). This project includes surveys of several utilities that have minimal education efforts, perform no other substantive conservation activities, and yet experienced significant demand reduction that coincided with rate increases. In those cases, savings estimates matched up closely with decreases in total GPCD. For many smaller utilities, especially those with customers lacking disposable income, this measure is the only tool used to conserve other than water loss reduction.

The following assumptions were made for water rate increases:

- The model assumes that savings persist into future years because it is expected that the utility will continue to make periodic rate increases in line with the percentage increases from previous years.
- Only the last two rate increases for a utility were quantified.
- Savings grow with demand because as new customers enter the service area, they are assumed to adhere to the same price elasticity model estimates.
- A weighted average for savings was used when rate increases differed between residential and industrial-commercial-institutional (ICI) customers based on the individual utility's customer class breakdown.
- When a utility raised rates using tiered rate conservation pricing, a 50/50 savings split was used when increases differed between base and volumetric rates.
    - The reasoning is that all customers must react to the base increase, yet the pricing signal is stronger when volumetric rate increases affect the higher usage customers.
    - The 50/50 split is reasonable because many customers will not reach the higher volumetric tiers.
    - Studies show that most customers do not actually know they have reached the higher volumetric tiers; just that their bill has increased (Texas Water Development Board, 2013).

4.1 Itemized Activities

1. **Utility Website**
    a. Easy-to-use website with conservation tips and water rates
    b. Features contact information for Public Works staff and customer service

2. **Continuing Public Education**
    a. The utility engages the public in many ways including:
        i. Brochures, bill messages, displays, and exhibits

3. **Water Loss Reduction Savings**[15]
    a. Savings of 247 MG annually in 2015
    b. Water loss reduction savings = the difference between a utility's baseline[16] water loss GPCD submitted in its most recent 5-year water conservation plan and its most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB
    c. If water loss GPCD has increased from the utility's baseline or historic 5-year average to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount.
    d. All savings estimates grow each year at the same rate population figures for the utility grow in the regional water plan.

[15] If current water loss levels exceed a utility's baseline, this value is treated as a deduction from total quantified savings.
[16] In the absence of having a baseline figure provided in the utility's most recently submitted 5-year water conservation plan, the historic 5-year average for water loss GPCD in the plan was used.

5 Summary of Savings

Table 5-1. Savings from Water Loss Reduction (MG).

Year	Utility Population	Water Loss GPCD	Total Savings from Water Loss Reduction (MG)
Baseline	-	12.00	0
2015	84,497	4.00	247
2016	87,140	4.00	254
2017	89,783	4.00	262
2018	92,425	4.00	270
2019	95,068	4.00	278
2020	97,711	4.00	285
2021	100,073	4.00	292
2022	102,435	4.00	299
2023	104,796	4.00	306
2024	107,158	4.00	313

6 Suggested Activities

Up to four activities were chosen as potential suggested activities for individual reports. These activities are: AMI system with customer portal, twice-per-week (or less) outdoor watering ordinances, strategic water rate increases, and rain barrels.

Activities were chosen because they are:

- Achievable
- Prevalence of vendors that can actually implement them
- Acceptability to city councils, MUD boards, et al.
- Easily adopted
- Cost effective
- Yield high savings relative to cost

AMI systems with customer engagement portals were also chosen because they represent a profusion of future applications that will undoubtedly continue to advance conservation efforts. AMI and meter data management (MDM) companies are developing new and innovative ways to benefit water providers, customers, and ultimately states that are pushing conservation and usage analytics further.

Each utility should be cognizant of the potential impact that these suggested activities may have on its own unique rate and revenue situation.

Benefits to consider:

- Avoided water supply and wastewater costs
    - The higher water purchase, transmission, and distribution costs are, the greater the potential benefit realized when large amounts of water are conserved with these activities.
- Avoided system expansion costs

- Conserving water may allow a utility to postpone building new system capacity by decreasing demand even as population grows.

Costs to consider:

- Staff time and resources
- Unit cost per unit saved
- Implementation costs
- Stakeholder agreement and support
- Other overhead and budget considerations

6.1 Suggested Activities with Savings Estimates

1. Twice-a-week Outdoor Watering Restriction Ordinance
   a. Potentially 4.84% savings of total demand (Hermitte and Mace, 2012; Sierra Club-Lone Star Chapter and National Wildlife Federation, 2015)
   b. Savings could be 189 MG per year with current demand.
   c. See Table 6-1 for potential savings from this measure compared with the city's WMS supply volumes targets.

Table 6-1. Current Savings + Potential Savings from 2x per Week Watering Ordinance (MG).

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Potential Savings from Ordinance	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)
2016	0	254	254	189	0	0	0	444
2017	0	262	262	194	0	0	0	456
2018	0	270	270	198	0	0	0	468
2019	0	278	278	202	0	0	0	480
2020	0	285	285	207	0	0	0	492
2021	0	292	292	211	3	0	3	501
2022	0	299	299	216	5	0	5	509
2023	0	306	306	220	8	0	8	518
2024	0	313	313	224	11	0	11	526
2025	0	320	320	229	14	0	14	535
2026	0	327	327	233	16	0	16	544
2027	0	334	334	237	19	0	19	552
2028	0	340	340	242	22	0	22	561
2029	0	347	347	246	24	0	24	569
2030	0	354	354	251	27	0	27	578
2031	0	361	361	255	50	0	50	566
2032	0	368	368	260	73	0	73	555
2033	0	375	375	264	96	0	96	543

2035	0	389	389	273	142	0	142	520
2036	0	396	396	278	165	0	165	508
2037	0	403	403	282	188	0	188	497
2038	0	410	410	287	211	0	211	485
2039	0	417	417	292	234	0	234	474
2040	0	424	424	296	257	0	257	462

2. Advanced Metering Infrastructure with Customer Engagement Portal

These portals, along with mobile applications and billing statements, can provide customers with much more access to their water use data in simple and compelling formats. This access and comparison with other customers' usage can reduce water use through changed behavior, as well as provide an opportunity for other conservation programs to be offered to the customer for increased adoption and additional savings. AMI systems support leak notification and web portals with real-time data. Any water loss reduction savings that these systems also yield were included in the water loss assessment of individual reports for this project.

- **a.** Specific utility results will vary based on portal features and frequency of customer notifications
- **b.** Potential savings estimate assumes 20% of residential customers will use and save water due to the portal (Westin Engineering, 2015)
- **c.** Estimate assumes customers will save 10% of total annual use due to the portal
    - i. Savings estimate of 10% is an average of results from multiple studies (Chesnutt and Mitchell, 2013; East Bay Municipal Utility District, 2014; IBM, 2011; Texas A&M and Texas Water Resources Institute, 2016; Westin Engineering, 2015)
- **d.** Residential customers' use assumed to make up approximately 67% of all retail customers' use based on utility profile information submitted to the TWDB
    - i. This was the most common percentage of residential use among participating utilities in this project.
    - ii. Actual customer class demand percentages will vary by utility.
- **e.** 20% of residential customers saving 10% with this customer class breakdown amounts to 1.34% of total demand
- **f.** Savings are assumed to increase along with demand as connections increase each year[17]
- **g.** See Table 6-2 for potential savings from this measure compared with the utility's WMS supply volumes targets.

[17] The 10% consumption reduction figure for 20% of residential customers is conservative, but savings could be greater when monitored yearly as customer engagement increases.

Table 6-2. Current Savings + Potential Savings from AMI with Customer Portal (MG).

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Potential Savings from AMI with Customer Portal	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)

2039	0	417	417	81	234	0	234	263
2040	0	424	424	82	257	0	257	248

3. Water Rate Increase
    a. For every 10% increase, estimated savings could be 2% of utility total demand.
    b. Approximately 78 MG of savings per year with current demand
    c. Savings is cumulative and based on more than one source[18] (U.S. EPA, 1998; Whitcomb, 1999)
    d. See Table 6-3 for potential savings from this measure compared with the utility's conservation goals.

[18] The study estimates a 2% demand reduction with 10% increase in price on a targeted customer class. By applying a ratio, it is possible to determine the savings for lower or higher percentage increases..

Table 6-3. Current Savings + Potential Savings from 10% Water Rate Increase (MG).

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Potential Savings from Water Rate Increase	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)

2040	0	424	424	122	257	0	257	288

4. Rain Barrels
    a. In Region M, utilities could save approximately 13.1 gallons per year per gallon of capacity rebated, sold, or distributed (GDS Associates, 2002).
    b. Estimated 10-year useful life for most barrels

TWDB Statewide Water Conservation Quantification Project
Hildalgo County MUD #1 Report • 2017

1 Introduction

In Texas' 2017 State Water Plan, municipal water conservation is projected to meet 9.6 percent[1] of the state's future water needs by 2070. According to the 16 regional water plans that comprise the state water plan, this is expected to be achieved through a variety of measures such as installation of water efficient plumbing fixtures, water conservation pricing structures, water system audits, landscape irrigation ordinances, as well as other water conservation activities. The 9.6 percent is "in addition to the estimated share of future passive conservation savings from plumbing codes and water efficiency standards, which are embedded in municipal water demand projections" (Texas Water Development Board, 2017).

In 2015, the Texas Legislature appropriated funds to the Texas Water Development Board (TWDB) to fund a research project principally charged with quantitatively determining the savings of municipal water conservation activities being implemented in relation to the recommended conservation goals (supply volumes) in the State Water Plan. As part of the project, individual reports were completed for all participating utilities.

With this report, utilities will benefit by receiving a clear and concise picture of its water conservation goals alongside estimated savings from quantifiable activities. In the event that current activity savings may not be able to reach long-term goals, this report offers suggestions on how utilities can reach water conservation goals with activities that are effective, easily adopted, have widespread appeal, and are quantifiable.

2 Municipal Conservation Terminology and Review of Methodology Used by Regional Planners

To make use of the results of this study, it is important to understand several key terms used in the water planning process.

What is a water user group?

In this report, a water user group (WUG) refers to a retail water provider in the form a city, municipal utility district, water control and improvement district, special utility district, water supply corporation, fresh water supply district, or other type of water utility. The TWDB further defines WUGs as one of the following (Texas Water Development Board, 2016b):

- Cities and towns with a population of 500 or more
- Non-city utilities providing more than 280 acre-feet per year per year of water for municipal use
- Collective reporting units (CRUs) consisting of grouped utilities having a common association

[1] Equal to 811,224 acre-feet per year in conservation savings.

- County-Wide WUGs:
    - County-Other (Rural/unincorporated areas of municipal water use)
    - Manufacturing
    - Steam electric power generation

What is a recommended water management strategy?

A recommended water management strategy (WMS) is a measure that will help ensure WUGs have adequate water supplies for their end users well into the future. WMS examples include river diversions, groundwater use, reservoir and aquifer development, and irrigation conservation. When WMS is referred to in this report, it refers only to municipal conservation, which may include water loss reduction as a part of the same strategy.

What is a WMS supply volume?

A WMS supply volume is the amount of water that a given strategy is expected to yield each decade in the planning period if carried out by the WUG. In this report, a WMS supply volume is the amount of water recommended to come from municipal water conservation.

Some regional water plans separate this strategy's supply volume into a volume for municipal water conservation and a volume for water loss reduction for each decade. The total strategy supply volume is the sum of both. A regional water plan may also refer to "advanced conservation" as part of this strategy. Advanced conservation usually indicates that the volume could be achieved through a more robust mix of conservation activities described in the plan.

2.1 Regional Planning Group Approach to Determining Supply Volumes

Each regional water planning group (RWPG) is responsible for producing its own individual plan that, if executed, will provide sufficient water to its WUGs throughout a 50-year planning period. These plans are completed in five-year cycles, with the most recent edition being completed in 2016. The 2016 regional plans make up the 2017 State Water Plan, which sets out WMS supply volumes for the years 2020 through 2070.

The decadal WMS supply volumes for municipal conservation were established by each of the RWPGs in much the same manner. The RWPGs generally followed the guidelines of the Texas Legislature's Water Conservation Implementation Task Force on the pace utilities should target to reduce gallons per capita per day (GPCD)[2] consumption levels.

The targeted reductions used by most regions follow this formula:

- For municipal WUGs with water use of 140 GPCD and greater, the goal is to reduce per capita water use by one percent per year until the level of 140 GPCD is reached,

[2] Regional water planning GPCD is defined as the annual volume of water pumped, diverted, or purchased minus the volume exported (sold) to other water systems or large industrial facilities divided by the permanent resident population of the Municipal Water User Group in the regional water planning process divided by 365. Saline and reused/recycled water are not included in this volume (Texas Water Development Board, 2012).

after which, the goal is to reduce per capita water use by one-fourth percent per year for the remainder of the planning period (Texas Water Development Board, 2016j).

The yearly reductions in GPCD for a given WUG are then converted into recommended supply volumes in acre-feet per year for each decade as the reductions in consumption continue. Some regions reduce GPCD by slightly different percentages before and after the 140 GPCD threshold, some do not apply further reductions in GPCD for WUGs once they reach 140 GPCD, while others recommend only "advanced conservation" activities once WUGs meet 140 GPCD.

2.2 Methodology

In order to complete a uniform quantification process, the first engagement was with utilities that agreed to participate and collected as much relevant data as possible. These data included, among many others, historical GPCD consumption figures, advanced metering infrastructure (AMI) specifications, and detailed feedback on each conservation activity being implemented. Personal interviews focused on determining when and to what extent these activities were being employed, as well as assessing plans to continue such conservation. Examples of frequently implemented activities include tiered water rate conservation pricing, strategic water rate increases, outdoor irrigation audits and ordinances, and rain barrel distribution.

Subsequently, each utility's conservation activities were quantified through several different means, including evidence-based studies, utility field results and savings determinations, manufacturer guarantees, water loss audits, TWDB studies, and other information that assigned a savings value to the activity's implementation.

Every conservation activity studied and quantified has a gallons-per-year estimate, useful life, and decay rate (if applicable) associated with it. Some activities' savings are projected to grow as demand grows over time, while some savings are constant each year and subside once useful life has run its course. For expanded methodology and details on studies and formulas used to determine activity savings, refer to Section 6 of the State Report included as part of this document.

Once analyzed, the resulting savings estimates from each utility were compared with the recommended WMS supply volumes in its respective regional plan to determine if the savings met, exceeded, or fell short of those volumes. Individual utility savings were aggregated to compare with regional volumes, and regional savings were aggregated to compare with state volumes.

It is important to note that this report quantified activity savings—not including water loss reduction—for the WMS supply volume comparison dating back to 2012. The reason for this is, with a few exceptions, the regional planners used 2011 as the base year for establishing potential WMS supply volumes.[3] In addition, any conservation savings achieved through 2011 are assumed to be accounted for in the regional water planning GPCD for that year.[4] Thus, quantifying from 2012 and forward is the most accurate way to determine if utilities are meeting

[3] Confirmed via personal communication with Region C, H, K, and L Plan consultants.
[4] It was established with TWDB planning staff that 2011 GPCD levels were chosen because they represented the most current water use and conservation patterns at the time.

the recommended conservation volumes in the regional plans. This assumption is by no means 100 percent accurate, however. Some previously implemented activities' savings persist into future years beyond this starting point, while some activities' savings have ceased. One year's GPCD will not necessarily include all savings yielded by conservation activities that came before it, but the quantification assessment must have a starting point.

2.3 Quantifiable Savings

The key to the project being useful and reliable is that the results from year to year are measurable. Quantifying conservation activities that can be accurately measured provides greater certainty and better planning for all stakeholders.

While many utilities are engaged in a variety of conservation activities, not all can currently be properly measured. Some examples of these activities include education initiatives, website and social media engagement, and enforcement for water waste. That does not mean these measures are not essential. Education of consumers, for example, is a fundamental activity that makes all others effective, but little hard data exists to quantify the results of education alone.

In addition, the work of conservation coordinators can have a particularly significant effect on the savings of all other activities, but the specific savings attributed to that staff role is difficult to quantify.

3 Results

This report compares Hildalgo County MUD #1's current water conservation activities and their quantified savings to two metrics: 1) Region M Water Plan's (Texas Water Development Board, 2016k) recommended WMS supply volumes for municipal conservation, and 2) Hildalgo County MUD #1's own 5- and 10-year goals as established in its most recent water conservation plan submitted to the TWDB.

The WMS supply volumes for municipal water conservation are laid out by decade (2020 – 2070) in the regional water plans to serve as benchmarks for what each utility could achieve via that strategy during a 50-year planning period.[5]

The 5- and 10-year goals in Hildalgo County MUD #1's most recent water conservation plan are established by the utility as realistic targets for reducing consumption over that timeframe. These reductions[6] are expressed in decreasing total GPCD [7] consumption and water loss GPCD.[8] [9]

---

[5] Some regional water plans separate this strategy volume into a volume for water conservation and a volume for water loss reduction for each decade. The total strategy volume is the sum of both.

[6] Occasionally, some utilities expect consumption to increase due to various reasons, such as an incoming industrial presence expected to raise consumption figures for the entire service area.

[7] As defined in TWDB water conservation plan annual report (Texas Water Development Board, 2016o): (Total Gallons in System ÷ Permanent Population) ÷ 365

[8] These plans also have targets for residential GPCD and water loss as a percentage (rather than GPCD), but this report does not address those goals.

[9] As defined in TWDB water conservation plan annual report (Texas Water Development Board, 2016o): (Total Water Loss ÷ Permanent Population) ÷ 365

The estimated savings in Tables 3-1 through 3-3 indicate the best information available as provided by utility staff. Some ongoing activities may not be known and are within a utility's service area are implemented on a micro-scale that may not be quantified. Individual households and businesses may be implementing conservation measures that are unknown and therefore cannot be included in the report.

Explanation of approach to assessing water loss reduction savings

Water loss reduction savings are defined as the volume of water participating utilities are realizing from their water loss mitigation efforts. For this report, this value is the difference between each individual utility's baseline[10] for water loss GPCD and its most recent water loss GPCD reported in 2015 water loss audits on file with TWDB. Savings from all water loss reduction efforts—including pipe replacements and leak repair—are assumed to be included in this comparison to a utility's baseline.

Note that because a single year (2015) value was used for comparison, it is possible that the 2015 value could be anomalous due to a number of events that may have occurred that year, such as a water main break, a particularly wet year, or a robust effort by the utility to curtail water loss. This will distort future savings figures that were carried forward in the study because water loss will inevitably increase or decrease in later years.

Ideally, using a rolling five-year average in the calculation would correct such anomalies. However, there was insufficient data to do that for every utility. The approach was to use the most complete water loss data possible, which was represented by the 2015 water loss audit. This problem will be further minimized, as continued data collection will allow five-year averages to be calculated for a majority of utilities.

In this way, water loss savings estimates are different from all other activity savings estimates in the project. Whether savings were positive or negative depended on where individual utilities established their own baselines or where their five-year average started, and what water loss GPCD value was reported in 2015.

3.1 Current Savings Compared to Conservation WMS Supply Volume (in million gallons) in Regional Water Plan

Table 3-1 shows the 2070 outlook for Hildalgo County MUD #1 with the utility's yearly recommended WMS supply volume in million gallons (MG) alongside its water savings from implemented activities, including from water loss reduction. These activities and their associated savings are covered in greater detail in Sections 4 and 5.

Starting in 2015, this table compares all quantified conservation activity and the recommended conservation WMS supply volume for the planning period. The following definitions pair with the column headers in Table 3-1.

Actual Current Conservation Activity Savings – All quantified activities currently being

[10] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.

performed by the utility, *excluding* savings from water loss reduction. The regional planners used 2011 GPCD as the baseline for determining future conservation WMS supply volumes, therefore the study quantifies utility savings starting in 2012 for this comparison. The summary of these savings can be referenced in Table 5-1.

Actual Water Loss Reduction Savings (as of 2015) – The difference between the baseline[11] for water loss GPCD and most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB. [12] The summary of these savings can be referenced in Table 5-1.

Total Savings from All Conservation Activity – Actual Current Conservation Activity Savings plus Actual Water Loss Reduction Savings (as of 2015).

Conservation WMS Volume – The recommended municipal water conservation supply volume in the regional plan for the decades ranging from 2020 to 2070. These volumes are converted to MG from the values listed in the plan in acre-feet and then calculated in annual increments.

Water Loss Reduction WMS Volume – Some regional water plans have a separate WMS volume for water conservation and for water loss reduction for each decade. If a WUG's regional plan has a WMS volume for water loss reduction, this column will have values other than zero.

Total Yearly WMS Volume – The sum of the Conservation WMS Volume and Water Loss Reduction WMS Volume.

Over (Short) – The amount that the utility's Total Savings from All Conservation Activity (since 2012), is over or below the Total Yearly WMS Volume in the regional water plan. If the amount falls below the WMS volume, it will appear in parentheses.

---

[11] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.
[12] If water loss GPCD has increased from the utility's baseline or historic five-year average to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount.

Table 3-1. Current Savings Compared to Conservation WMS Supply Volume (MG) in Regional Water Plan.

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)
2015	0	18	18	25	0	25	(7)

3.2 Utility Water Conservation Plan Goals – Total GPCD

Table 3-2 shows how Canyon's quantified savings from its implemented activities compare with 5- and 10-year goals established in its individual water conservation plan submitted to the TWDB. The following definitions pair with the column headers in Table 3-2.

Utility Population – Estimated utility service area population for the years indicated.

Total GPCD Goals – Total GPCD goals start with the utility's baseline[13] for total GPCD and progress in subsequent years to match 5- and 10-year goals indicated in a utility's five-year water conservation plan on file with the TWDB. The first five annual GPCD goals were developed by spreading the difference between the baseline and five-year goal evenly over five years. The second five annual GPCD goals spread the difference between the five-year goal and 10-year goal evenly over the next five years.

Annual Savings Goal with Reduction in GPCD (MG) – This column shows what reductions from the baseline GPCD would yield in terms of volume each year as more water is saved. The volumes indicated here are what target GPCD goals look like expressed in million gallons. Annual volumes were derived using the formula: (baseline total GPCD – target total GPCD for that year) x 365 days ÷ 1,000,000 gallons.

Total Savings for All Current Quantified Activities (MG) – Total quantified savings for all current conservation activities and savings from water loss reduction.

Over (Short) – The amount that the utility's total quantified savings for all current conservation activities (since 2012), including water loss reduction, is over or below the volume represented by reductions in GPCD each year. If the quantified savings are less than these target volumes, the value will appear in parentheses.

Table 3-2. Utility Water Conservation Plan Goals — Total GPCD.

Year #	Year	Utility Population	Total GPCD Goals	Annual Savings Goal with Reduction in GPCD (MG)	Total Savings for All Current Quantified Activities (MG)	Over (Short) (MG)
0	**Baseline**	-	77	0	0	0
1	2016	8,258	76	4	18	14
2	2017	8,287	74	8	18	10
3	2018	8,315	73	13	18	5
4	2019	8,344	71	17	18	1
5-year Goal	2020	8,373	70	21	18	(3)
6	2021	8,387	69	24	18	(6)
7	2022	8,402	68	28	18	(9)
8	2023	8,416	67	31	18	(12)
9	2024	8,430	66	34	18	(15)
10-year Goal	2025	8,445	65	37	18	(18)

[13] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for total GPCD from the utility's most recently submitted five-year water conservation plan was used.

3.3 Utility Water Conservation Plan Goals – Water Loss GPCD

Table 3-3 shows how Hildalgo County MUD #1's most recent water loss audit compares with 5- and 10-year water loss goals in its water conservation plan. The following definitions pair with the column headers in Table 3-2.

Utility Population – Estimated utility service area population for the years indicated.

Water Loss GPCD Goals – Water loss GPCD goals start with the utility's baseline[14] for water loss GPCD and progress in subsequent years to match 5- and 10-year water loss goals indicated in a utility's five-year water conservation plan on file with the TWDB. The first five annual GPCD goals were developed by spreading the difference between the baseline and five-year goal evenly over five years. The second five annual GPCD goals spread the difference between the five-year goal and 10-year goal evenly over the next five years.

Yearly Savings Goal with Reduction in GPCD (MG) – This column shows what reductions from the baseline water loss GPCD would yield in terms of volume each year as more water is saved. The volumes indicated here are what target water loss GPCD goals look like expressed in million gallons. Annual volumes were derived using the formula: (baseline water loss GPCD – target water loss GPCD for that year) x 365 days ÷ 1,000,000 gallons.

Total Savings from Water Loss Reduction (MG) – The difference between a utility's established baseline for water loss GPCD and the most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB. If water loss GPCD has increased from the utility's baseline to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount. Reference Table 5-1 for savings from water loss reduction.

Over (Short) – The amount that the utility's total savings from water loss reduction is over or below the volume represented by reductions in GPCD each year. If water loss reduction savings are less than these target volumes, the value will appear in parentheses.

Table 3-3. Utility Water Conservation Plan Goals — Water Loss GPCD.

Year #	Year	Utility Population	Water Loss GPCD Goals	Yearly Savings Goal with Reduction in GPCD (MG)	Total Savings from Water Loss Reduction (MG)	Over (Short) (MG)
0	**Baseline**	-	14.00	0	0	0
1	2016	8,258	13.00	3	18	15
2	2017	8,287	12.00	6	18	12
3	2018	8,315	11.00	9	18	9
4	2019	8,344	10.00	12	18	6
5-year Goal	2020	8,373	9.00	15	18	3
6	2021	8,387	8.60	17	18	2
7	2022	8,402	8.20	18	18	1
8	2023	8,416	7.80	19	18	(1)
9	2024	8,430	7.40	20	18	(2)
10-year Goal	2025	8,445	7.00	22	18	(3)

[14] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.

4 Implemented Activities

Below is a list of completed activities with estimated water savings. Note that drought response and other measures are not included in the utility's water savings because they are temporary, awareness-based or not able to be accurately quantified on an annual basis.

These are not savings projections of potential future activities. Estimated savings are based on measures that have actually been implemented. If savings are shown to persist in future years, it is because the measure is permanent, such as an ordinance, or the savings are assumed to continue for the reason listed under the itemized activity. Estimated savings from water rate increases are the one exception to these conditions.

Water Rate Increases

Savings from water rate increases were included because entities such as the U.S. Environmental Protection Agency and others indicate specific savings for utilities that raise rates (Texas Water Development Board, 2013; U.S. E.P.A., 1998; Whitcomb, 1999). This project includes surveys of several utilities that have minimal education efforts, perform no other substantive conservation activities, and yet experienced significant demand reduction that coincided with rate increases. In those cases, savings estimates matched up closely with decreases in total GPCD. For many smaller utilities, especially those with customers lacking disposable income, this measure is the only tool used to conserve other than water loss reduction.

The following assumptions were made for water rate increases:

- The model assumes that savings persist into future years because it is expected that the utility will continue to make periodic rate increases in line with the percentage increases from previous years.
- Only the last two rate increases for a utility were quantified.
- Savings grow with demand because as new customers enter the service area, they are assumed to adhere to the same price elasticity model estimates.
- A weighted average for savings was used when rate increases differed between residential and industrial-commercial-institutional (ICI) customers based on the individual utility's customer class breakdown.
- When a utility raised rates using tiered rate conservation pricing, a 50/50 savings split was used when increases differed between base and volumetric rates.
    - The reasoning is that all customers must react to the base increase, yet the pricing signal is stronger when volumetric rate increases affect the higher usage customers.
    - The 50/50 split is reasonable because many customers will not reach the higher volumetric tiers.
    - Studies show that most customers do not actually know they have reached the higher volumetric tiers; just that their bill has increased (Texas Water Development Board, 2013).

4.1 Itemized Activities

1. **Utility Website**
    a. Easy-to-use website with conservation tips and water rates
    b. Features contact information for Public Works staff and customer service

2. **Continuing Public Education**
    a. The utility engages the public in many ways including:
        i. Brochures, bill messages, displays, and exhibits

3. **Water Loss Reduction Savings**[15]
    a. Savings of 18 MG annually in 2015
    b. Water loss reduction savings = the difference between a utility's baseline[16] water loss GPCD submitted in its most recent 5-year water conservation plan and its most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB
    c. If water loss GPCD has increased from the utility's baseline or historic 5-year average to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount.
    d. All savings estimates grow each year at the same rate population figures for the utility grow in the regional water plan.

[15] If current water loss levels exceed a utility's baseline, this value is treated as a deduction from total quantified savings.
[16] In the absence of having a baseline figure provided in the utility's most recently submitted 5-year water conservation plan, the historic 5-year average for water loss GPCD in the plan was used.

5 Summary of Savings

Table 5-1. Savings from Water Loss Reduction (MG).

Year	Utility Population	Water Loss GPCD	Total Savings from Water Loss Reduction (MG)
Baseline	-	14.00	0
2015	8,229	8.00	18
2016	8,258	8.00	18
2017	8,287	8.00	18
2018	8,315	8.00	18
2019	8,344	8.00	18
2020	8,373	8.00	18
2021	8,387	8.00	18
2022	8,402	8.00	18
2023	8,416	8.00	18
2024	8,430	8.00	18

6 Suggested Activities

Up to four activities were chosen as potential suggested activities for individual reports. These activities are: AMI system with customer portal, twice-per-week (or less) outdoor watering ordinances, strategic water rate increases, and rain barrels.

Activities were chosen because they are:

- Achievable
- Prevalence of vendors that can actually implement them
- Acceptability to city councils, MUD boards, et al.
- Easily adopted
- Cost effective
- Yield high savings relative to cost

AMI systems with customer engagement portals were also chosen because they represent a profusion of future applications that will undoubtedly continue to advance conservation efforts. AMI and meter data management (MDM) companies are developing new and innovative ways to benefit water providers, customers, and ultimately states that are pushing conservation and usage analytics further.

Each utility should be cognizant of the potential impact that these suggested activities may have on its own unique rate and revenue situation.

Benefits to consider:

- Avoided water supply and wastewater costs
    - The higher water purchase, transmission, and distribution costs are, the greater the potential benefit realized when large amounts of water are conserved with these activities.

- Avoided system expansion costs
    - Conserving water may allow a utility to postpone building new system capacity by decreasing demand even as population grows.

Costs to consider:

- Staff time and resources
- Unit cost per unit saved
- Implementation costs
- Stakeholder agreement and support
- Other overhead and budget considerations

6.1 Suggested Activities with Savings Estimates

1. Twice-a-week Outdoor Watering Restriction Ordinance
    - **a.** Potentially 5.05% savings of total demand (Hermitte and Mace, 2012; Sierra Club-Lone Star Chapter and National Wildlife Federation, 2015)
        - i. Average Region M savings
        - ii. Specific percentage of outdoor usage unknown for your utility at this time
    - **b.** Savings could be 9 MG per year with current demand.
    - **c.** See Table 6-1 for potential savings from this measure compared with the city's WMS supply volumes targets.

Table 6-1. Current Savings + Potential Savings from 2x per Week Watering Ordinance (MG).

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Potential Savings from Ordinance	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)
2016	0	18	18	9	31	0	31	(4)
2017	0	18	18	9	31	0	31	(4)
2018	0	18	18	9	37	0	37	(10)
2019	0	18	18	9	43	0	43	(16)
2020	0	18	18	9	56	0	56	(28)
2021	0	18	18	10	56	0	56	(28)
2022	0	18	18	10	57	0	57	(29)

2. Advanced Metering Infrastructure with Customer Engagement Portal

These portals, along with mobile applications and billing statements, can provide customers with much more access to their water use data in simple and compelling formats. This access and comparison with other customers' usage can reduce water use through changed behavior, as well as provide an opportunity for other conservation programs to be offered to the customer for increased adoption and additional savings. AMI systems support leak notification and web portals with real-time data. Any water loss reduction savings that these systems also yield were included in the water loss assessment of individual reports for this project.

- **a.** Specific utility results will vary based on portal features and frequency of customer notifications
- **b.** Potential savings estimate assumes 20% of residential customers will use and save water due to the portal (Westin Engineering, 2015)
- **c.** Estimate assumes customers will save 10% of total annual use due to the portal
    - i. Savings estimate of 10% is an average of results from multiple studies (Chesnutt and Mitchell, 2013; East Bay Municipal Utility District, 2014; IBM, 2011; Texas A&M and Texas Water Resources Institute, 2016; Westin Engineering, 2015)
- **d.** Residential customers' use assumed to make up approximately 67% of all retail customers' use based on utility profile information submitted to the TWDB
    - i. This was the most common percentage of residential use among participating utilities in this project.
    - ii. Actual customer class demand percentages will vary by utility.
- **e.** 20% of residential customers saving 10% with this customer class breakdown amounts to 1.34% of total demand
- **f.** Savings are assumed to increase along with demand as connections increase each year[17]
- **g.** See Table 6-2 for potential savings from this measure compared with the utility's WMS supply volumes targets.

[17] The 10% consumption reduction figure for 20% of residential customers is conservative, but savings could be greater when monitored yearly as customer engagement increases.

Table 6-2. Current Savings + Potential Savings from AMI with Customer Portal (MG).

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Potential Savings from AMI with Customer Portal	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)

3. Water Rate Increase

a. For every 10% increase, estimated savings could be 2% of utility total demand.

b. Approximately 3 MG of savings per year with current demand

c. Savings is cumulative and based on more than one source[18] (U.S. EPA, 1998; Whitcomb, 1999)

d. See Table 6-3 for potential savings from this measure compared with the utility's conservation goals.

[18] The study estimates a 2% demand reduction with 10% increase in price on a targeted customer class. By applying a ratio, it is possible to determine the savings for lower or higher percentage increases.

Table 6-3. Current Savings + Potential Savings from 10% Water Rate Increase (MG).

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Potential Savings from Water Rate Increase	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)

4. Rain Barrels
   a. In Region M, utilities could save approximately 13.1 gallons per year per gallon of capacity rebated, sold, or distributed (GDS Associates, 2002).
   b. Estimated 10-year useful life for most barrels

Statewide Water Conservation Quantification Project
City of Laredo Report • 2017

1 Introduction

In Texas' 2017 State Water Plan, municipal water conservation is projected to meet 9.6 percent[1] of the state's future water needs by 2070. According to the 16 regional water plans that comprise the state water plan, this is expected to be achieved through a variety of measures such as installation of water efficient plumbing fixtures, water conservation pricing structures, water system audits, landscape irrigation ordinances, as well as other water conservation activities. The 9.6 percent is "in addition to the estimated share of future passive conservation savings from plumbing codes and water efficiency standards, which are embedded in municipal water demand projections" (Texas Water Development Board, 2017).

In 2015, the Texas Legislature appropriated funds to the Texas Water Development Board (TWDB) to fund a research project principally charged with quantitatively determining the savings of municipal water conservation activities being implemented in relation to the recommended conservation goals (supply volumes) in the State Water Plan. As part of the project, individual reports were completed for all participating utilities.

With this report, utilities will benefit by receiving a clear and concise picture of its water conservation goals alongside estimated savings from quantifiable activities. In the event that current activity savings may not be able to reach long-term goals, this report offers suggestions on how utilities can reach water conservation goals with activities that are effective, easily adopted, have widespread appeal, and are quantifiable.

2 Municipal Conservation Terminology and Review of Methodology Used by Regional Planners

To make use of the results of this study, it is important to understand several key terms used in the water planning process.

What is a water user group?

In this report, a water user group (WUG) refers to a retail water provider in the form a city, municipal utility district, water control and improvement district, special utility district, water supply corporation, fresh water supply district, or other type of water utility. The TWDB further defines WUGs as one of the following (Texas Water Development Board, 2016b):

- Cities and towns with a population of 500 or more
- Non-city utilities providing more than 280 acre-feet per year per year of water for municipal use
- Collective reporting units (CRUs) consisting of grouped utilities having a common association

[1] Equal to 811,224 acre-feet per year in conservation savings.

- County-Wide WUGs:
    - County-Other (Rural/unincorporated areas of municipal water use)
    - Manufacturing
    - Steam electric power generation

What is a recommended water management strategy?

A recommended water management strategy (WMS) is a measure that will help ensure WUGs have adequate water supplies for their end users well into the future. WMS examples include river diversions, groundwater use, reservoir and aquifer development, and irrigation conservation. When WMS is referred to in this report, it refers only to municipal conservation, which may include water loss reduction as a part of the same strategy.

What is a WMS supply volume?

A WMS supply volume is the amount of water that a given strategy is expected to yield each decade in the planning period if carried out by the WUG. In this report, a WMS supply volume is the amount of water recommended to come from municipal water conservation.

Some regional water plans separate this strategy's supply volume into a volume for municipal water conservation and a volume for water loss reduction for each decade. The total strategy supply volume is the sum of both. A regional water plan may also refer to "advanced conservation" as part of this strategy. Advanced conservation usually indicates that the volume could be achieved through a more robust mix of conservation activities described in the plan.

2.1 Regional Planning Group Approach to Determining Supply Volumes

Each regional water planning group (RWPG) is responsible for producing its own individual plan that, if executed, will provide sufficient water to its WUGs throughout a 50-year planning period. These plans are completed in five-year cycles, with the most recent edition being completed in 2016. The 2016 regional plans make up the 2017 State Water Plan, which sets out WMS supply volumes for the years 2020 through 2070.

The decadal WMS supply volumes for municipal conservation were established by each of the RWPGs in much the same manner. The RWPGs generally followed the guidelines of the Texas Legislature's Water Conservation Implementation Task Force on the pace utilities should target to reduce gallons per capita per day (GPCD)[2] consumption levels.

The targeted reductions used by most regions follow this formula:

- For municipal WUGs with water use of 140 GPCD and greater, the goal is to reduce per capita water use by one percent per year until the level of 140 GPCD is reached,

[2] Regional water planning GPCD is defined as the annual volume of water pumped, diverted, or purchased minus the volume exported (sold) to other water systems or large industrial facilities divided by the permanent resident population of the Municipal Water User Group in the regional water planning process divided by 365. Saline and reused/recycled water are not included in this volume (Texas Water Development Board, 2012).

> after which, the goal is to reduce per capita water use by one-fourth percent per year for the remainder of the planning period (Texas Water Development Board, 2016j).

The yearly reductions in GPCD for a given WUG are then converted into recommended supply volumes in acre-feet per year for each decade as the reductions in consumption continue. Some regions reduce GPCD by slightly different percentages before and after the 140 GPCD threshold, some do not apply further reductions in GPCD for WUGs once they reach 140 GPCD, while others recommend only "advanced conservation" activities once WUGs meet 140 GPCD.

2.2 Methodology

In order to complete a uniform quantification process, the first engagement was with utilities that agreed to participate and collected as much relevant data as possible. These data included, among many others, historical GPCD consumption figures, advanced metering infrastructure (AMI) specifications, and detailed feedback on each conservation activity being implemented. Personal interviews focused on determining when and to what extent these activities were being employed, as well as assessing plans to continue such conservation. Examples of frequently implemented activities include tiered water rate conservation pricing, strategic water rate increases, outdoor irrigation audits and ordinances, and rain barrel distribution.

Subsequently, each utility's conservation activities were quantified through several different means, including evidence-based studies, utility field results and savings determinations, manufacturer guarantees, water loss audits, TWDB studies, and other information that assigned a savings value to the activity's implementation.

Every conservation activity studied and quantified has a gallons-per-year estimate, useful life, and decay rate (if applicable) associated with it. Some activities' savings are projected to grow as demand grows over time, while some savings are constant each year and subside once useful life has run its course. For expanded methodology and details on studies and formulas used to determine activity savings, refer to Section 6 of the State Report included as part of this document.

Once analyzed, the resulting savings estimates from each utility were compared with the recommended WMS supply volumes in its respective regional plan to determine if the savings met, exceeded, or fell short of those volumes. Individual utility savings were aggregated to compare with regional volumes, and regional savings were aggregated to compare with state volumes.

It is important to note that this report quantified activity savings—not including water loss reduction—for the WMS supply volume comparison dating back to 2012. The reason for this is, with a few exceptions, the regional planners used 2011 as the base year for establishing potential WMS supply volumes.[3] In addition, any conservation savings achieved through 2011 are assumed to be accounted for in the regional water planning GPCD for that year.[4] Thus, quantifying from 2012 and forward is the most accurate way to determine if utilities are meeting

[3] Confirmed via personal communication with Region C, H, K, and L Plan consultants.
[4] It was established with TWDB planning staff that 2011 GPCD levels were chosen because they represented the most current water use and conservation patterns at the time.

the recommended conservation volumes in the regional plans. This assumption is by no means 100 percent accurate, however. Some previously implemented activities' savings persist into future years beyond this starting point, while some activities' savings have ceased. One year's GPCD will not necessarily include all savings yielded by conservation activities that came before it, but the quantification assessment must have a starting point.

2.3 Quantifiable Savings

The key to the project being useful and reliable is that the results from year to year are measurable. Quantifying conservation activities that can be accurately measured provides greater certainty and better planning for all stakeholders.

While many utilities are engaged in a variety of conservation activities, not all can currently be properly measured. Some examples of these activities include education initiatives, website and social media engagement, and enforcement for water waste. That does not mean these measures are not essential. Education of consumers, for example, is a fundamental activity that makes all others effective, but little hard data exists to quantify the results of education alone.

In addition, the work of conservation coordinators can have a particularly significant effect on the savings of all other activities, but the specific savings attributed to that staff role is difficult to quantify.

3 Results

This report compares Laredo's current water conservation activities and their quantified savings to two metrics: 1) Region M Water Plan's (Texas Water Development Board, 2016k) recommended WMS supply volumes for municipal conservation, and 2) Laredo's own 5- and 10-year goals as established in its most recent water conservation plan submitted to the TWDB.

The WMS supply volumes for municipal water conservation are laid out by decade (2020 – 2070) in the regional water plans to serve as benchmarks for what each utility could achieve via that strategy during a 50-year planning period.[5]

The 5- and 10-year goals in Laredo's most recent water conservation plan are established by the utility as realistic targets for reducing consumption over that timeframe. These reductions[6] are expressed in decreasing total GPCD[7] consumption and water loss GPCD.[8] [9]

The estimated savings in Tables 3-1 through 3-3 indicate the best information available as

[5] Some regional water plans separate this strategy volume into a volume for water conservation and a volume for water loss reduction for each decade. The total strategy volume is the sum of both.

[6] Occasionally, some utilities expect consumption to increase due to various reasons, such as an incoming industrial presence expected to raise consumption figures for the entire service area.

[7] As defined in TWDB water conservation plan annual report (Texas Water Development Board, 2016o): (Total Gallons in System ÷ Permanent Population) ÷ 365

[8] These plans also have targets for residential GPCD and water loss as a percentage (rather than GPCD), but this report does not address those goals.

[9] As defined in TWDB water conservation plan annual report (Texas Water Development Board, 2016o): (Total Water Loss ÷ Permanent Population) ÷ 365

provided by utility staff. Some ongoing activities may not be known and are within a utility's service area are implemented on a micro-scale that may not be quantified. Individual households and businesses may be implementing conservation measures that are unknown and therefore cannot be included in the report..

Explanation of approach to assessing water loss reduction savings

Water loss reduction savings are defined as the volume of water participating utilities are realizing from their water loss mitigation efforts. For this report, this value is the difference between each individual utility's baseline[10] for water loss GPCD and its most recent water loss GPCD reported in 2015 water loss audits on file with TWDB. Savings from all water loss reduction efforts—including pipe replacements and leak repair—are assumed to be included in this comparison to a utility's baseline.

Note that because a single year (2015) value was used for comparison, it is possible that the 2015 value could be anomalous due to a number of events that may have occurred that year, such as a water main break, a particularly wet year, or a robust effort by the utility to curtail water loss. This will distort future savings figures that were carried forward in the study because water loss will inevitably increase or decrease in later years.

Ideally, using a rolling five-year average in the calculation would correct such anomalies. However, there was insufficient data to do that for every utility. The approach was to use the most complete water loss data possible, which was represented by the 2015 water loss audit. This problem will be further minimized, as continued data collection will allow five-year averages to be calculated for a majority of utilities..

In this way, water loss savings estimates are different from all other activity savings estimates in the project. Whether savings were positive or negative depended on where individual utilities established their own baselines or where their five-year average started, and what water loss GPCD value was reported in 2015.

3.1 Current Savings Compared to Conservation WMS Supply Volume (in million gallons) in Regional Water Plan

Table 3-1 shows the 2070 outlook for Laredo with the utility's yearly recommended WMS supply volume in million gallons (MG) alongside its water savings from implemented activities, including from water loss reduction. These activities and their associated savings are covered in greater detail in Sections 4 and 5.

Starting in 2015, this table compares all quantified conservation activity and the recommended conservation WMS supply volume for the planning period. The following definitions pair with the column headers in Table 3-1.

<u>Actual Current Conservation Activity Savings</u> – All quantified activities currently being performed by the utility, *excluding* savings from water loss reduction. The regional planners used

[10] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.

2011 GPCD as the baseline for determining future conservation WMS supply volumes, therefore the study quantifies utility savings starting in 2012 for this comparison. The summary of these savings can be referenced in Table 5-1

Actual Water Loss Reduction Savings (as of 2015) – The difference between the baseline[11] for water loss GPCD and most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB. [12] The summary of these savings can be referenced in Table 5-2.

Total Savings from All Conservation Activity – Actual Current Conservation Activity Savings plus Actual Water Loss Reduction Savings (as of 2015).

Conservation WMS Volume – The recommended municipal water conservation supply volume in the regional plan for the decades ranging from 2020 to 2070. These volumes are converted to MG from the values listed in the plan in acre-feet and then calculated in annual increments.

Water Loss Reduction WMS Volume – Some regional water plans have a separate WMS volume for water conservation and for water loss reduction for each decade. If a WUG's regional plan has a WMS volume for water loss reduction, this column will have values other than zero.

Total Yearly WMS Volume – The sum of the Conservation WMS Volume and Water Loss Reduction WMS Volume.

Over (Short) – The amount that the utility's Total Savings from All Conservation Activity (since 2012), is over or below the Total Yearly WMS Volume in the regional water plan. If the amount falls below the WMS volume, it will appear in parentheses.

[11] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.
[12] If water loss GPCD has increased from the utility's baseline or historic five-year average to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount.

Table 3-1. Current Savings Compared to Conservation WMS Supply Volume (MG) in Regional Water Plan.

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)

3.2 Utility Water Conservation Plan Goals – Total GPCD

Table 3-2 shows how Laredo's quantified savings from its implemented activities compare with 5- and 10-year goals established in its individual water conservation plan submitted to the TWDB. The following definitions pair with the column headers in Table 3-2.

Utility Population – Estimated utility service area population for the years indicated.

Total GPCD Goals – Total GPCD goals start with the utility's baseline[13] for total GPCD and progress in subsequent years to match five- and 10-year goals indicated in a utility's five-year water conservation plan on file with the TWDB. The first five annual GPCD goals were developed by spreading the difference between the baseline and five-year goal evenly over five years. The second five annual GPCD goals spread the difference between the five-year goal and 10-year goal evenly over the next five years.

Annual Savings Goal with Reduction in GPCD (MG) – This column shows what reductions from the baseline GPCD would yield in terms of volume each year as more water is saved. The volumes indicated here are what target GPCD goals look like expressed in million gallons. Annual volumes were derived using the formula: (baseline total GPCD – target total GPCD for that year) x 365 days ÷ 1,000,000 gallons.

Total Savings for All Current Quantified Activities (MG) – Total quantified savings for all current conservation activities and savings from water loss reduction. Refer to Tables 5-1 and 5-2 for details on these savings.

Over (Short) – The amount that the utility's total quantified savings for all current conservation activities (since 2012), including water loss reduction, is over or below the volume represented by reductions in GPCD each year. If the quantified savings are less than these target volumes, the value will appear in parentheses.

Table 3-2. Utility Water Conservation Plan Goals — Total GPCD.

Year #	Year	Utility Population	Total GPCD Goals	Annual Savings Goal with Reduction in GPCD (MG)	Total Savings for All Current Quantified Activities (MG)	Over (Short) (MG)
0	**Baseline**	-	150	0	0	0
1	2015	268,030	146	391	452	61
2	2016	274,418	142	801	513	(289)
3	2017	280,806	138	1,230	524	(706)
4	2018	287,193	134	1,677	536	(1,141)
5-year Goal	2019	293,581	130	2,143	546	(1,597)
6	2020	299,969	126	2,628	558	(2,070)
7	2021	307,067	122	3,138	570	(2,568)
8	2022	314,166	118	3,669	583	(3,086)
9	2023	321,264	114	4,221	596	(3,626)
10-year Goal	2024	328,362	110	4,794	608	(4,186)

[13] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for total GPCD from the utility's most recently submitted five-year water conservation plan was used.

3.3 Utility Water Conservation Plan Goals – Water Loss GPCD

Table 3-3 shows how Laredo's most recent water loss audit compares with five- and 10-year water loss goals in its water conservation plan. The following definitions pair with the column headers in Table 3-2.

Utility Population – Estimated utility service area population for the years indicated.

Water Loss GPCD Goals – Water loss GPCD goals start with the utility's baseline[14] for water loss GPCD and progress in subsequent years to match 5- and 10-year water loss goals indicated in a utility's five-year water conservation plan on file with the TWDB. The first five annual GPCD goals were developed by spreading the difference between the baseline and five-year goal evenly over five years. The second five annual GPCD goals spread the difference between the five-year goal and 10-year goal evenly over the next five years

Yearly Savings Goal with Reduction in GPCD (MG) – This column shows what reductions from the baseline water loss GPCD would yield in terms of volume each year as more water is saved. The volumes indicated here are what target water loss GPCD goals look like expressed in million gallons. Annual volumes were derived using the formula: (baseline water loss GPCD – target water loss GPCD for that year) x 365 days ÷ 1,000,000 gallons.

Total Savings from Water Loss Reduction (MG) – The difference between a utility's established baseline for water loss GPCD and the most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB. If water loss GPCD has increased from the utility's baseline to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount. Reference Table 5-2 for savings from water loss reduction.

Over (Short) – The amount that the utility's total savings from water loss reduction is over or below the volume represented by reductions in GPCD each year. If water loss reduction savings are less than these target volumes, the value will appear in parentheses.

Table 3-3. Utility Water Conservation Plan Goals — Water Loss GPCD.

Year #	Year	Utility Population	Water Loss GPCD Goals	Yearly Savings Goal with Reduction in GPCD (MG)	Total Savings from Water Loss Reduction (MG)	Over (Short) (MG)
0	**Baseline**	-	18.00	0	0	0
1	2015	268,030	17.00	98	391	293
2	2016	274,418	16.00	200	401	200
3	2017	280,806	15.00	307	410	102
4	2018	287,193	14.00	419	419	0
5-year Goal	2019	293,581	13.00	536	429	(107)
6	2020	299,969	12.20	635	438	(197)
7	2021	307,067	11.40	740	448	(291)
8	2022	314,166	10.60	849	459	(390)
9	2023	321,264	9.80	962	469	(492)
10-year Goal	2024	328,362	9.00	1,079	479	(599)

[14] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.

4 Implemented Activities

Below is a list of completed activities with estimated water savings. Note that drought response and other measures are not included in the utility's water savings because they are temporary, awareness-based or not able to be accurately quantified on an annual basis.

These are not savings projections of potential future activities. Estimated savings are based on measures that have actually been implemented. If savings are shown to persist in future years, it is because the measure is permanent, such as an ordinance, or the savings are assumed to continue for the reason listed under the itemized activity. Estimated savings from water rate increases are the one exception to these conditions.

Water Rate Increases

Savings from water rate increases were included because entities such as the U.S. Environmental Protection Agency and others indicate specific savings for utilities that raise rates (Texas Water Development Board, 2013; U.S. E.P.A., 1998; Whitcomb, 1999). This project includes surveys of several utilities that have minimal education efforts, perform no other substantive conservation activities, and yet experienced significant demand reduction that coincided with rate increases. In those cases, savings estimates matched up closely with decreases in total GPCD. For many smaller utilities, especially those with customers lacking disposable income, this measure is the only tool used to conserve other than water loss reduction.

The following assumptions were made for water rate increases:

- The model assumes that savings persist into future years because it is expected that the utility will continue to make periodic rate increases in line with the percentage increases from previous years.
- Only the last two rate increases for a utility were quantified.
- Savings grow with demand because as new customers enter the service area, they are assumed to adhere to the same price elasticity model estimates.
- A weighted average for savings was used when rate increases differed between residential and industrial-commercial-institutional (ICI) customers based on the individual utility's customer class breakdown.
- When a utility raised rates using tiered rate conservation pricing, a 50/50 savings split was used when increases differed between base and volumetric rates.
  - The reasoning is that all customers must react to the base increase, yet the pricing signal is stronger when volumetric rate increases affect the higher usage customers.
  - The 50/50 split is reasonable because many customers will not reach the higher volumetric tiers.
  - Studies show that most customers do not actually know they have reached the higher volumetric tiers; just that their bill has increased (Texas Water Development Board, 2013).

4.1 Itemized Activities

1. **Utility Website**
    a. Easy-to-use website with conservation tips and water rates
    b. Features contact information for Public Works staff and customer service

2. **Continuing Public Education**
    a. The utility engages the public in many ways including:
        i. Brochures, bill messages, displays, and exhibits

3. **Water Loss Reduction Savings**[15]
    a. Savings of 391 MG annually in 2015
    b. Water loss reduction savings = the difference between a utility's baseline[16] water loss GPCD submitted in its most recent 5-year water conservation plan and its most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB
    c. If water loss GPCD has increased from the utility's baseline or historic 5-year average to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount.
    d. All savings estimates grow each year at the same rate population figures for the utility grow in the regional water plan.

4. **Water Rate Increases**
    a. Last rate increases:[17]
        i. 2.0% increase in 2015
        ii. 2.0% increase in 2016
    b. Estimated customer demand reduction of .8%
    c. Savings is cumulative and based on more than one source[18] (U.S. EPA, 1998; Whitcomb, 1999)
    d. Savings from rate increases are shown to persist over time, however, note that savings from these pricing signals will likely decrease if rates remain the same in future years.

5. **Automatic Meter Reading (AMR)/Advanced Metering Infrastructure (AMI)**
    a. These metering systems can save water in a number of ways, including from water loss reduction through improved leak detection.
    b. All water loss reduction savings associated with this activity are detailed in Section 5, which assessed utility baseline water loss GPCD and most recently reported water loss GPCD to determine water savings.

---

[15] If current water loss levels exceed a utility's baseline, this value is treated as a deduction from total quantified savings.
[16] In the absence of having a baseline figure provided in the utility's most recently submitted 5-year water conservation plan, the historic 5-year average for water loss GPCD in the plan was used.
[17] Correspondence with utility staff.
[18] The study estimates a 2% demand reduction with 10% increase in price on a targeted customer class. By applying a ratio, it is possible to determine the savings for lower or higher percentage increases..

c. For estimated water savings that could be increased by implementing meter data management (MDM) and customer engagement portal applications, refer to Section 6 of this report.
    i. With these additional applications, water savings can be achieved through changed customer behavior and other real-time actions that go beyond water loss reduction.

6. WaterWise Take-home Kits

a. Estimated savings of 7,384 gallons per year per kit (Frontier Associates, 2015)
b. Conservative 5-year useful life for all items in kit
c. 15% adoption rate assumed

7. High Efficiency (HE) Toilet Replacement Program

a. Estimated 10,390 gallons per year per toilet (A&N Technical Services, 2005)
b. Number of replacements per year provided by staff
c. Savings carry on indefinitely because replacement toilet will be as efficient

8. Showerhead Distribution (SF)

a. Estimated 2,050 gallons per year per showerhead (A&N Technical Services, 2005)
b. 5-year useful life
    i. If distributed after 2009, plumbing code will require that replacement is equally as efficient, so savings will carry forward indefinitely

5 Summary of Savings

Table 5-1. Savings by Water Conservation Activity (MG).

Year	Water Rate Increases	HE Toilets (Residential)	Low Flow Showerheads (Residential)	WaterWise Take-home Kits	TOTAL SAVINGS
2009					0
2010					0
2011					0
2012					0
2013		1.1			1
2014		4.3	2.1	1.1	7
2015	49	6.6	4.1	1.1	61

2021	307,067	14.00	448
2022	314,166	14.00	459
2023	321,264	14.00	469
2024	328,362	14.00	479

6 Suggested Activities

Up to four activities were chosen as potential suggested activities for individual reports. These activities are: AMI system with customer portal, twice-per-week (or less) outdoor watering ordinances, strategic water rate increases, and rain barrels.

Activities were chosen because they are:

- Achievable
- Prevalence of vendors that can actually implement them
- Acceptability to city councils, MUD boards, et al.
- Easily adopted
- Cost effective
- Yield high savings relative to cost

AMI systems with customer engagement portals were also chosen because they represent a profusion of future applications that will undoubtedly continue to advance conservation efforts. AMI and meter data management (MDM) companies are developing new and innovative ways to benefit water providers, customers, and ultimately states that are pushing conservation and usage analytics further.

Each utility should be cognizant of the potential impact that these suggested activities may have on its own unique rate and revenue situation.

Benefits to consider:

- Avoided water supply and wastewater costs
  - The higher water purchase, transmission, and distribution costs are, the greater the potential benefit realized when large amounts of water are conserved with these activities.
- Avoided system expansion costs

- Conserving water may allow a utility to postpone building new system capacity by decreasing demand even as population grows.

Costs to consider:

- Staff time and resources
- Unit cost per unit saved
- Implementation costs
- Stakeholder agreement and support
- Other overhead and budget considerations

6.1 Suggested Activities with Savings Estimates

1. Twice-a-week Outdoor Watering Restriction Ordinance
   a. Potentially 5.47% savings of total demand (Hermitte and Mace, 2012; Sierra Club-Lone Star Chapter and National Wildlife Federation, 2015)
   b. Savings could be 686 MG per year with current demand.
   c. See Table 6-1 for potential savings from this measure compared with the city's WMS supply volumes targets.

Table 6-1. Current Savings + Potential Savings from 2x per Week Watering Ordinance (MG).

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Potential Savings from Ordinance	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)
2016	112	401	513	686	0	0	0	1,199
2017	114	410	524	701	0	0	0	1,225
2018	117	419	536	716	0	0	0	1,252
2019	118	429	546	731	0	0	0	1,278
2020	120	438	558	746	0	0	0	1,304
2021	122	448	570	761	0	0	0	1,332
2022	124	459	583	777	0	0	0	1,360
2023	126	469	596	792	0	0	0	1,387
2024	129	479	608	807	0	0	0	1,415
2025	131	490	621	822	0	0	0	1,443
2026	133	500	633	837	0	0	0	1,470
2027	135	510	646	852	0	0	0	1,498
2028	138	521	658	867	0	0	0	1,526
2029	140	531	671	882	0	0	0	1,553
2030	142	542	684	897	0	0	0	1,581
2031	144	551	696	912	0	0	0	1,608
2032	146	561	708	927	0	0	0	1,634
2033	148	571	720	941	0	0	0	1,661
2034	151	581	732	956	0	0	0	1,688
2035	153	591	744	971	0	0	0	1,715
2036	155	601	756	986	0	0	0	1,741
2037	157	611	768	1,000	0	0	0	1,768
2038	159	621	780	1,015	0	0	0	1,795
2039	161	630	792	1,030	0	0	0	1,821
2040	163	640	804	1,044	0	0	0	1,848

2. Advanced Metering Infrastructure with Customer Engagement Portal

These portals, along with mobile applications and billing statements, can provide customers with much more access to their water use data in simple and compelling formats. This access and comparison with other customers' usage can reduce water use through changed behavior, as well as provide an opportunity for other conservation programs to be offered to the customer for increased adoption and additional savings. AMI systems support leak notification and web portals with real-time data. Any water loss reduction savings that these systems also yield were included in the water loss assessment of individual reports for this project.

- **a.** Specific utility results will vary based on portal features and frequency of customer notifications
- **b.** Potential savings estimate assumes 20% of residential customers will use and save water due to the portal (Westin Engineering, 2015)
- **c.** Estimate assumes customers will save 10% of total annual use due to the portal
    - i. Savings estimate of 10% is an average of results from multiple studies (Chesnutt and Mitchell, 2013; East Bay Municipal Utility District, 2014; IBM, 2011; Texas A&M and Texas Water Resources Institute, 2016; Westin Engineering, 2015)
- **d.** Residential customers' use assumed to make up approximately 67% of all retail customers' use based on utility profile information submitted to the TWDB
    - i. This was the most common percentage of residential use among participating utilities in this project.
    - ii. Actual customer class demand percentages will vary by utility.
- **e.** 20% of residential customers saving 10% with this customer class breakdown amounts to 1.34% of total demand
- **f.** Savings are assumed to increase along with demand as connections increase each year[19]
- **g.** See Table 6-2 for potential savings from this measure compared with the utility's WMS supply volumes targets.

[19] The 10% consumption reduction figure for 20% of residential customers is conservative, but savings could be greater when monitored yearly as customer engagement increases.

Table 6-2. Current Savings + Potential Savings from AMI with Customer Portal (MG).

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Potential Savings from AMI with Customer Portal	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)
2016	112	401	513	168	0	0	0	681
2017	114	410	524	172	0	0	0	696
2018	117	419	536	175	0	0	0	711
2019	118	429	546	179	0	0	0	725
2020	120	438	558	183	0	0	0	741
2021	122	448	570	187	0	0	0	757
2022	124	459	583	190	0	0	0	773
2023	126	469	596	194	0	0	0	789
2024	129	479	608	198	0	0	0	806
2025	131	490	621	201	0	0	0	822
2026	133	500	633	205	0	0	0	838
2027	135	510	646	209	0	0	0	855
2028	138	521	658	212	0	0	0	871
2029	140	531	671	216	0	0	0	887
2030	142	542	684	220	0	0	0	903
2031	144	551	696	223	0	0	0	919
2032	146	561	708	227	0	0	0	935
2033	148	571	720	231	0	0	0	950
2034	151	581	732	234	0	0	0	966
2035	153	591	744	238	0	0	0	981
2036	155	601	756	241	0	0	0	997
2037	157	611	768	245	0	0	0	1,013
2038	159	621	780	249	0	0	0	1,028
2039	161	630	792	252	0	0	0	1,044
2040	163	640	804	256	0	0	0	1,060

3. Rain Barrels
    a. In Region M, utilities could save approximately 13.1 gallons per year per gallon of capacity rebated, sold, or distributed (GDS Associates, 2002).
    b. Estimated 10-year useful life for most barrels

Statewide Water Conservation Quantification Project
City of McAllen Report • 2017

1 Introduction

In Texas' 2017 State Water Plan, municipal water conservation is projected to meet 9.6 percent[1] of the state's future water needs by 2070. According to the 16 regional water plans that comprise the state water plan, this is expected to be achieved through a variety of measures such as installation of water efficient plumbing fixtures, water conservation pricing structures, water system audits, landscape irrigation ordinances, as well as other water conservation activities. The 9.6 percent is "in addition to the estimated share of future passive conservation savings from plumbing codes and water efficiency standards, which are embedded in municipal water demand projections" (Texas Water Development Board, 2017).

In 2015, the Texas Legislature appropriated funds to the Texas Water Development Board (TWDB) to fund a research project principally charged with quantitatively determining the savings of municipal water conservation activities being implemented in relation to the recommended conservation goals (supply volumes) in the State Water Plan. As part of the project, individual reports were completed for all participating utilities.

With this report, utilities will benefit by receiving a clear and concise picture of its water conservation goals alongside estimated savings from quantifiable activities. In the event that current activity savings may not be able to reach long-term goals, this report offers suggestions on how utilities can reach water conservation goals with activities that are effective, easily adopted, have widespread appeal, and are quantifiable.

2 Municipal Conservation Terminology and Review of Methodology Used by Regional Planners

To make use of the results of this study, it is important to understand several key terms used in the water planning process.

What is a water user group?

In this report, a water user group (WUG) refers to a retail water provider in the form a city, municipal utility district, water control and improvement district, special utility district, water supply corporation, fresh water supply district, or other type of water utility. The TWDB further defines WUGs as one of the following (Texas Water Development Board, 2016b):

- Cities and towns with a population of 500 or more
- Non-city utilities providing more than 280 acre-feet per year per year of water for municipal use
- Collective reporting units (CRUs) consisting of grouped utilities having a common association

[1] Equal to 811,224 acre-feet per year in conservation savings.

- County-Wide WUGs:
    - County-Other (Rural/unincorporated areas of municipal water use)
    - Manufacturing
    - Steam electric power generation

What is a recommended water management strategy?

A recommended water management strategy (WMS) is a measure that will help ensure WUGs have adequate water supplies for their end users well into the future. WMS examples include river diversions, groundwater use, reservoir and aquifer development, and irrigation conservation. When WMS is referred to in this report, it refers only to municipal conservation, which may include water loss reduction as a part of the same strategy.

What is a WMS supply volume?

A WMS supply volume is the amount of water that a given strategy is expected to yield each decade in the planning period if carried out by the WUG. In this report, a WMS supply volume is the amount of water recommended to come from municipal water conservation.

Some regional water plans separate this strategy's supply volume into a volume for municipal water conservation and a volume for water loss reduction for each decade. The total strategy supply volume is the sum of both. A regional water plan may also refer to "advanced conservation" as part of this strategy. Advanced conservation usually indicates that the volume could be achieved through a more robust mix of conservation activities described in the plan.

2.1 Regional Planning Group Approach to Determining Supply Volumes

Each regional water planning group (RWPG) is responsible for producing its own individual plan that, if executed, will provide sufficient water to its WUGs throughout a 50-year planning period. These plans are completed in five-year cycles, with the most recent edition being completed in 2016. The 2016 regional plans make up the 2017 State Water Plan, which sets out WMS supply volumes for the years 2020 through 2070.

The decadal WMS supply volumes for municipal conservation were established by each of the RWPGs in much the same manner. The RWPGs generally followed the guidelines of the Texas Legislature's Water Conservation Implementation Task Force on the pace utilities should target to reduce gallons per capita per day (GPCD)[2] consumption levels.

The targeted reductions used by most regions follow this formula:

- For municipal WUGs with water use of 140 GPCD and greater, the goal is to reduce per capita water use by one percent per year until the level of 140 GPCD is reached,

[2] Regional water planning GPCD is defined as the annual volume of water pumped, diverted, or purchased minus the volume exported (sold) to other water systems or large industrial facilities divided by the permanent resident population of the Municipal Water User Group in the regional water planning process divided by 365. Saline and reused/recycled water are not included in this volume (Texas Water Development Board, 2012).

after which, the goal is to reduce per capita water use by one-fourth percent per year for the remainder of the planning period (Texas Water Development Board, 2016j).

The yearly reductions in GPCD for a given WUG are then converted into recommended supply volumes in acre-feet per year for each decade as the reductions in consumption continue. Some regions reduce GPCD by slightly different percentages before and after the 140 GPCD threshold, some do not apply further reductions in GPCD for WUGs once they reach 140 GPCD, while others recommend only "advanced conservation" activities once WUGs meet 140 GPCD.

2.2 Methodology

In order to complete a uniform quantification process, the first engagement was with utilities that agreed to participate and collected as much relevant data as possible. These data included, among many others, historical GPCD consumption figures, advanced metering infrastructure (AMI) specifications, and detailed feedback on each conservation activity being implemented. Personal interviews focused on determining when and to what extent these activities were being employed, as well as assessing plans to continue such conservation. Examples of frequently implemented activities include tiered water rate conservation pricing, strategic water rate increases, outdoor irrigation audits and ordinances, and rain barrel distribution.

Subsequently, each utility's conservation activities were quantified through several different means, including evidence-based studies, utility field results and savings determinations, manufacturer guarantees, water loss audits, TWDB studies, and other information that assigned a savings value to the activity's implementation.

Every conservation activity studied and quantified has a gallons-per-year estimate, useful life, and decay rate (if applicable) associated with it. Some activities' savings are projected to grow as demand grows over time, while some savings are constant each year and subside once useful life has run its course. For expanded methodology and details on studies and formulas used to determine activity savings, refer to Section 6 of the State Report included as part of this document.

Once analyzed, the resulting savings estimates from each utility were compared with the recommended WMS supply volumes in its respective regional plan to determine if the savings met, exceeded, or fell short of those volumes. Individual utility savings were aggregated to compare with regional volumes, and regional savings were aggregated to compare with state volumes.

It is important to note that this report quantified activity savings—not including water loss reduction—for the WMS supply volume comparison dating back to 2012. The reason for this is, with a few exceptions, the regional planners used 2011 as the base year for establishing potential WMS supply volumes.[3] In addition, any conservation savings achieved through 2011 are assumed to be accounted for in the regional water planning GPCD for that year.[4] Thus, quantifying from 2012 and forward is the most accurate way to determine if utilities are meeting

[3] Confirmed via personal communication with Region C, H, K, and L Plan consultants.
[4] It was established with TWDB planning staff that 2011 GPCD levels were chosen because they represented the most current water use and conservation patterns at the time.

the recommended conservation volumes in the regional plans. This assumption is by no means 100 percent accurate, however. Some previously implemented activities' savings persist into future years beyond this starting point, while some activities' savings have ceased. One year's GPCD will not necessarily include all savings yielded by conservation activities that came before it, but the quantification assessment must have a starting point.

2.3 Quantifiable Savings

The key to the project being useful and reliable is that the results from year to year are measurable. Quantifying conservation activities that can be accurately measured provides greater certainty and better planning for all stakeholders.

While many utilities are engaged in a variety of conservation activities, not all can currently be properly measured. Some examples of these activities include education initiatives, website and social media engagement, and enforcement for water waste. That does not mean these measures are not essential. Education of consumers, for example, is a fundamental activity that makes all others effective, but little hard data exists to quantify the results of education alone.

In addition, the work of conservation coordinators can have a particularly significant effect on the savings of all other activities, but the specific savings attributed to that staff role is difficult to quantify.

3 Results

This report compares McAllen's current water conservation activities and their quantified savings to two metrics: 1) Region M Water Plan's (Texas Water Development Board, 2016k) recommended WMS supply volumes for municipal conservation, and 2) McAllen's own 5- and 10-year goals as established in its most recent water conservation plan submitted to the TWDB.

The WMS supply volumes for municipal water conservation are laid out by decade (2020 – 2070) in the regional water plans to serve as benchmarks for what each utility could achieve via that strategy during a 50-year planning period.[5]

The 5- and 10-year goals in McAllen's most recent water conservation plan are established by the utility as realistic targets for reducing consumption over that timeframe. These reductions[6] are expressed in decreasing total GPCD[7] consumption and water loss GPCD.[8] [9]

The estimated savings in Tables 3-1 through 3-3 indicate the best information available as

[5] Some regional water plans separate this strategy volume into a volume for water conservation and a volume for water loss reduction for each decade. The total strategy volume is the sum of both.

[6] Occasionally, some utilities expect consumption to increase due to various reasons, such as an incoming industrial presence expected to raise consumption figures for the entire service area.

[7] As defined in TWDB water conservation plan annual report (Texas Water Development Board, 2016o): (Total Gallons in System ÷ Permanent Population) ÷ 365

[8] These plans also have targets for residential GPCD and water loss as a percentage (rather than GPCD), but this report does not address those goals.

[9] As defined in TWDB water conservation plan annual report (Texas Water Development Board, 2016o): (Total Water Loss ÷ Permanent Population) ÷ 365

provided by utility staff. Some ongoing activities may not be known and are within a utility's service area are implemented on a micro-scale that may not be quantified. Individual households and businesses may be implementing conservation measures that are unknown and therefore cannot be included in the report.

Explanation of approach to assessing water loss reduction savings

Water loss reduction savings are defined as the volume of water participating utilities are realizing from their water loss mitigation efforts. For this report, this value is the difference between each individual utility's baseline[10] for water loss GPCD and its most recent water loss GPCD reported in 2015 water loss audits on file with TWDB. Savings from all water loss reduction efforts—including pipe replacements and leak repair—are assumed to be included in this comparison to a utility's baseline.

Note that because a single year (2015) value was used for comparison, it is possible that the 2015 value could be anomalous due to a number of events that may have occurred that year, such as a water main break, a particularly wet year, or a robust effort by the utility to curtail water loss. This will distort future savings figures that were carried forward in the study because water loss will inevitably increase or decrease in later years.

Ideally, using a rolling five-year average in the calculation would correct such anomalies. However, there was insufficient data to do that for every utility. The approach was to use the most complete water loss data possible, which was represented by the 2015 water loss audit. This problem will be further minimized, as continued data collection will allow five-year averages to be calculated for a majority of utilities

In this way, water loss savings estimates are different from all other activity savings estimates in the project. Whether savings were positive or negative depended on where individual utilities established their own baselines or where their five-year average started, and what water loss GPCD value was reported in 2015.

3.1 Current Savings Compared to Conservation WMS Supply Volume (in million gallons) in Regional Water Plan

Table 3-1 shows the 2070 outlook for McAllen with the utility's yearly recommended WMS supply volume in million gallons (MG) alongside its water savings from implemented activities, including from water loss reduction. These activities and their associated savings are covered in greater detail in Sections 4 and 5.

Starting in 2015, this table compares all quantified conservation activity and the recommended conservation WMS supply volume for the planning period. The following definitions pair with the column headers in Table 3-1.

<u>Actual Current Conservation Activity Savings</u> – All quantified activities currently being performed by the utility, *excluding* savings from water loss reduction. The regional planners used

---

[10] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.

2011 GPCD as the baseline for determining future conservation WMS supply volumes, therefore the study quantifies utility savings starting in 2012 for this comparison. The summary of these savings can be referenced in Table 5-1.

Actual Water Loss Reduction Savings (as of 2015) – The difference between the baseline[11] for water loss GPCD and most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB. [12] The summary of these savings can be referenced in Table 5-2.

Total Savings from All Conservation Activity – Actual Current Conservation Activity Savings plus Actual Water Loss Reduction Savings (as of 2015).

Conservation WMS Volume – The recommended municipal water conservation supply volume in the regional plan for the decades ranging from 2020 to 2070. These volumes are converted to MG from the values listed in the plan in acre-feet and then calculated in annual increments.

Water Loss Reduction WMS Volume – Some regional water plans have a separate WMS volume for water conservation and for water loss reduction for each decade. If a WUG's regional plan has a WMS volume for water loss reduction, this column will have values other than zero.

Total Yearly WMS Volume – The sum of the Conservation WMS Volume and Water Loss Reduction WMS Volume.

Over (Short) – The amount that the utility's Total Savings from All Conservation Activity (since 2012), is over or below the Total Yearly WMS Volume in the regional water plan. If the amount falls below the WMS volume, it will appear in parentheses.

[11] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.

[12] If water loss GPCD has increased from the utility's baseline or historic five-year average to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount.

Table 3-1. Current Savings Compared to Conservation WMS Supply Volume (MG) in Regional Water Plan.

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)
2015	270	(358)	(89)	242	0	242	(331)
2016	276	(371)	(94)	303	0	303	(398)

3.2 Utility Water Conservation Plan Goals – Total GPCD

Table 3-2 shows how McAllen's quantified savings from its implemented activities compare with 5- and 10-year goals established in its individual water conservation plan submitted to the TWDB. The following definitions pair with the column headers in Table 3-2.

Utility Population – Estimated utility service area population for the years indicated.

Total GPCD Goals – Total GPCD goals start with the utility's baseline[13] for total GPCD and progress in subsequent years to match 5- and 10-year goals indicated in a utility's five-year water conservation plan on file with the TWDB. The first five annual GPCD goals were developed by spreading the difference between the baseline and five-year goal evenly over five years. The second five annual GPCD goals spread the difference between the five-year goal and 10-year goal evenly over the next five years.

Annual Savings Goal with Reduction in GPCD (MG) – This column shows what reductions from the baseline GPCD would yield in terms of volume each year as more water is saved. The volumes indicated here are what target GPCD goals look like expressed in million gallons. Annual volumes were derived using the formula: (baseline total GPCD – target total GPCD for that year) x 365 days ÷ 1,000,000 gallons.

Total Savings for All Current Quantified Activities (MG) – Total quantified savings for all current conservation activities and savings from water loss reduction. Refer to Tables 5-1 and 5-2 for details on these savings.

Over (Short) – The amount that the utility's total quantified savings for all current conservation activities (since 2012), including water loss reduction, is over or below the volume represented by reductions in GPCD each year. If the quantified savings are less than these target volumes, the value will appear in parentheses.

Table 3-2. Utility Water Conservation Plan Goals — Total GPCD.

Year #	Year	Utility Population	Total GPCD Goals	Annual Savings Goal with Reduction in GPCD (MG)	Total Savings for All Current Quantified Activities (MG)	Over (Short) (MG)
0	**Baseline**	-	136	0	0	0
1	2015	140,269	142	(297)	(89)	208
2	2016	145,135	148	(614)	(94)	520
3	2017	150,000	153	(953)	(100)	852
4	2018	154,866	159	(1,311)	(106)	1,205
5-year Goal	2019	159,731	165	(1,691)	(112)	1,579
6	2020	164,597	164	(1,682)	(118)	1,565
7	2021	168,576	163	(1,661)	(121)	1,540
8	2022	172,554	162	(1,638)	(125)	1,513
9	2023	176,533	161	(1,611)	(128)	1,483
10-year Goal	2024	180,511	160	(1,581)	(132)	1,450

[13] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for total GPCD from the utility's most recently submitted five-year water conservation plan was used.

3.3 Utility Water Conservation Plan Goals – Water Loss GPCD

Table 3-3 shows how McAllen's most recent water loss audit compares with 5- and 10-year water loss goals in its water conservation plan. The following definitions pair with the column headers in Table 3-2.

Utility Population – Estimated utility service area population for the years indicated.

Water Loss GPCD Goals – Water loss GPCD goals start with the utility's baseline[14] for water loss GPCD and progress in subsequent years to match 5- and 10-year water loss goals indicated in a utility's five-year water conservation plan on file with the TWDB. The first five annual GPCD goals were developed by spreading the difference between the baseline and five-year goal evenly over five years. The second five annual GPCD goals spread the difference between the five-year goal and 10-year goal evenly over the next five years.

Yearly Savings Goal with Reduction in GPCD (MG) – This column shows what reductions from the baseline water loss GPCD would yield in terms of volume each year as more water is saved. The volumes indicated here are what target water loss GPCD goals look like expressed in million gallons. Annual volumes were derived using the formula: (baseline water loss GPCD – target water loss GPCD for that year) x 365 days ÷ 1,000,000 gallons.

Total Savings from Water Loss Reduction (MG) – The difference between a utility's established baseline for water loss GPCD and the most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB. If water loss GPCD has increased from the utility's baseline to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount. Reference Table 5-2 for savings from water loss reduction.

Over (Short) – The amount that the utility's total savings from water loss reduction is over or below the volume represented by reductions in GPCD each year. If water loss reduction savings are less than these target volumes, the value will appear in parentheses.

Table 3-3. Utility Water Conservation Plan Goals — Water Loss GPCD.

Year #	Year	Utility Population	Water Loss GPCD Goals	Yearly Savings Goal with Reduction in GPCD (MG)	Total Savings from Water Loss Reduction (MG)	Over (Short) (MG)
0	**Baseline**	-	14.00	0	0	0
1	2015	140,269	13.80	10	(358)	(369)
2	2016	145,135	13.60	21	(371)	(392)
3	2017	150,000	13.40	33	(383)	(416)
4	2018	154,866	13.20	45	(396)	(441)
5-year Goal	2019	159,731	13.00	58	(408)	(466)
6	2020	164,597	13.00	60	(421)	(481)
7	2021	168,576	13.00	62	(431)	(492)
8	2022	172,554	13.00	63	(441)	(504)
9	2023	176,533	13.00	64	(451)	(515)
10-year Goal	2024	180,511	13.00	66	(461)	(527)

[14] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.

4 Implemented Activities

Below is a list of completed activities with estimated water savings. Note that drought response and other measures are not included in the utility's water savings because they are temporary, awareness-based or not able to be accurately quantified on an annual basis.

These are not savings projections of potential future activities. Estimated savings are based on measures that have actually been implemented. If savings are shown to persist in future years, it is because the measure is permanent, such as an ordinance, or the savings are assumed to continue for the reason listed under the itemized activity. Estimated savings from water rate increases are the one exception to these conditions.

Water Rate Increases

Savings from water rate increases were included because entities such as the U.S. Environmental Protection Agency and others indicate specific savings for utilities that raise rates (Texas Water Development Board, 2013; U.S. E.P.A., 1998; Whitcomb, 1999). This project includes surveys of several utilities that have minimal education efforts, perform no other substantive conservation activities, and yet experienced significant demand reduction that coincided with rate increases. In those cases, savings estimates matched up closely with decreases in total GPCD. For many smaller utilities, especially those with customers lacking disposable income, this measure is the only tool used to conserve other than water loss reduction.

The following assumptions were made for water rate increases:

- The model assumes that savings persist into future years because it is expected that the utility will continue to make periodic rate increases in line with the percentage increases from previous years.
- Only the last two rate increases for a utility were quantified.
- Savings grow with demand because as new customers enter the service area, they are assumed to adhere to the same price elasticity model estimates.
- A weighted average for savings was used when rate increases differed between residential and industrial-commercial-institutional (ICI) customers based on the individual utility's customer class breakdown.
- When a utility raised rates using tiered rate conservation pricing, a 50/50 savings split was used when increases differed between base and volumetric rates.
    - The reasoning is that all customers must react to the base increase, yet the pricing signal is stronger when volumetric rate increases affect the higher usage customers.
    - The 50/50 split is reasonable because many customers will not reach the higher volumetric tiers.
    - Studies show that most customers do not actually know they have reached the higher volumetric tiers; just that their bill has increased (Texas Water Development Board, 2013).

4.1 Itemized Activities

1. **Utility Website**
    a. Easy-to-use website with conservation tips and water rates
    b. Features contact information for Public Works staff and customer service

2. **Continuing Public Education**
    a. The utility engages the public in many ways including:
        i. Brochures, bill messages, displays, and exhibits

3. **Water Loss Reduction Savings**[15]
    a. Loss of 358 MG annually in 2015
    b. Water loss reduction savings = the difference between a utility's baseline[16] water loss GPCD submitted in its most recent 5-year water conservation plan and its most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB
    c. If water loss GPCD has increased from the utility's baseline or historic 5-year average to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount.
    d. All savings estimates grow each year at the same rate population figures for the utility grow in the regional water plan.

4. **Water Rate Increase**
    a. Last rate increase:[17]
        i. 12.0% increase in 2015
    b. Estimated customer demand reduction of 2.4%
    c. Savings is cumulative and based on more than one source[18] (U.S. EPA, 1998; Whitcomb, 1999)
    d. Savings from rate increases are shown to persist over time, however, note that savings from these pricing signals will likely decrease if rates remain the same in future years.

5. **Automatic Meter Reading (AMR)/Advanced Metering Infrastructure (AMI)**
    a. These metering systems can save water in a number of ways, including from water loss reduction through improved leak detection.
    b. All water loss reduction savings associated with this activity are detailed in Section 5, which assessed utility baseline water loss GPCD and most recently reported water loss GPCD to determine water savings.

---

[15] If current water loss levels exceed a utility's baseline, this value is treated as a deduction from total quantified savings.
[16] In the absence of having a baseline figure provided in the utility's most recently submitted 5-year water conservation plan, the historic 5-year average for water loss GPCD in the plan was used.
[17] Correspondence with utility staff.
[18] The study estimates a 2% demand reduction with 10% increase in price on a targeted customer class. By applying a ratio, it is possible to determine the savings for lower or higher percentage increases.

c. For estimated water savings that could be increased by implementing meter data management (MDM) and customer engagement portal applications, refer to Section 6 of this report.
    i. With these additional applications, water savings can be achieved through changed customer behavior and other real-time actions that go beyond water loss reduction.

5 Summary of Savings

Table 5-1. Savings by Water Conservation Activity (MG).

Year	Water Rate Increases	TOTAL SAVINGS
2015	270	270
2016	276	276
2017	283	283
2018	290	290
2019	296	296
2020	303	303
2021	310	310
2022	316	316

2024	180,511	21	(461)

6 Suggested Activities

Up to four activities were chosen as potential suggested activities for individual reports. These activities are: AMI system with customer portal, twice-per-week (or less) outdoor watering ordinances, strategic water rate increases, and rain barrels.

Activities were chosen because they are:

- Achievable
- Prevalence of vendors that can actually implement them
- Acceptability to city councils, MUD boards, et al.
- Easily adopted
- Cost effective
- Yield high savings relative to cost

AMI systems with customer engagement portals were also chosen because they represent a profusion of future applications that will undoubtedly continue to advance conservation efforts. AMI and meter data management (MDM) companies are developing new and innovative ways to benefit water providers, customers, and ultimately states that are pushing conservation and usage analytics further.

Each utility should be cognizant of the potential impact that these suggested activities may have on its own unique rate and revenue situation.

Benefits to consider:

- Avoided water supply and wastewater costs
  - The higher water purchase, transmission, and distribution costs are, the greater the potential benefit realized when large amounts of water are conserved with these activities.
- Avoided system expansion costs
  - Conserving water may allow a utility to postpone building new system capacity by decreasing demand even as population grows.

Costs to consider:

- Staff time and resources
- Unit cost per unit saved
- Implementation costs
- Stakeholder agreement and support
- Other overhead and budget considerations

6.1 Suggested Activities with Savings Estimates

1. Twice-a-week Outdoor Watering Restriction Ordinance
    a. Potentially 5.05% savings of total demand (Hermitte and Mace, 2012; Sierra Club-Lone Star Chapter and National Wildlife Federation, 2015)
        i. Average Region M savings
        ii. Specific percentage of outdoor usage unknown for your utility at this time
    b. Savings could be 581 MG per year with current demand.
    c. See Table 6-1 for potential savings from this measure compared with the city's WMS supply volumes targets.

Table 6-1. Current Savings + Potential Savings from 2x per Week Watering Ordinance (MG).

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Potential Savings from Ordinance	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)
2016	276	(371)	(94)	581	303	0	303	184

2030	369	(522)	(153)	777	1,828	0	1,828	(1,203)
2031	376	(532)	(156)	791	2,000	0	2,000	(1,365)
2032	383	(543)	(160)	806	2,172	0	2,172	(1,526)
2033	390	(553)	(163)	820	2,344	0	2,344	(1,687)
2034	396	(563)	(167)	834	2,516	0	2,516	(1,848)
2035	403	(573)	(170)	848	2,688	0	2,688	(2,010)
2036	410	(583)	(173)	863	2,860	0	2,860	(2,171)
2037	417	(594)	(177)	877	3,032	0	3,032	(2,332)
2038	423	(604)	(180)	891	3,204	0	3,204	(2,494)
2039	430	(614)	(184)	905	3,376	0	3,376	(2,655)
2040	437	(624)	(187)	920	3,548	0	3,548	(2,816)

2. Advanced Metering Infrastructure with Customer Engagement Portal

These portals, along with mobile applications and billing statements, can provide customers with much more access to their water use data in simple and compelling formats. This access and comparison with other customers' usage can reduce water use through changed behavior, as well as provide an opportunity for other conservation programs to be offered to the customer for increased adoption and additional savings. AMI systems support leak notification and web portals with real-time data. Any water loss reduction savings that these systems also yield were included in the water loss assessment of individual reports for this project.

- **a.** Specific utility results will vary based on portal features and frequency of customer notifications
- **b.** Potential savings estimate assumes 20% of residential customers will use and save water due to the portal (Westin Engineering, 2015)
- **c.** Estimate assumes customers will save 10% of total annual use due to the portal
    - i. Savings estimate of 10% is an average of results from multiple studies (Chesnutt and Mitchell, 2013; East Bay Municipal Utility District, 2014; IBM, 2011; Texas A&M and Texas Water Resources Institute, 2016; Westin Engineering, 2015)
- **d.** Residential customers' use assumed to make up approximately 67% of all retail customers' use based on utility profile information submitted to the TWDB
    - i. This was the most common percentage of residential use among participating utilities in this project.
    - ii. Actual customer class demand percentages will vary by utility.
- **e.** 20% of residential customers saving 10% with this customer class breakdown amounts to 1.34% of total demand
- **f.** Savings are assumed to increase along with demand as connections increase each year[19]
- **g.** See Table 6-2 for potential savings from this measure compared with the utility's WMS supply volumes targets.

[19] The 10% consumption reduction figure for 20% of residential customers is conservative, but savings could be greater when monitored yearly as customer engagement increases.

Table 6-2. Current Savings + Potential Savings from AMI with Customer Portal (MG).

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Potential Savings from AMI with Customer Portal	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)
2016	276	(371)	(94)	154	303	0	303	(243)
2017	283	(383)	(100)	158	303	0	303	(245)
2018	290	(396)	(106)	162	364	0	364	(308)

2025	336	(471)	(135)	188	1,187	0	1,187	(1,134)
2026	343	(482)	(139)	191	1,315	0	1,315	(1,262)
2027	349	(492)	(142)	195	1,443	0	1,443	(1,390)
2028	356	(502)	(146)	199	1,571	0	1,571	(1,518)
2029	363	(512)	(149)	203	1,699	0	1,699	(1,646)
2030	369	(522)	(153)	206	1,828	0	1,828	(1,774)
2031	376	(532)	(156)	210	2,000	0	2,000	(1,946)
2032	383	(543)	(160)	214	2,172	0	2,172	(2,118)
2033	390	(553)	(163)	218	2,344	0	2,344	(2,289)
2034	396	(563)	(167)	221	2,516	0	2,516	(2,461)
2035	403	(573)	(170)	225	2,688	0	2,688	(2,633)
2036	410	(583)	(173)	229	2,860	0	2,860	(2,805)
2037	417	(594)	(177)	233	3,032	0	3,032	(2,976)
2038	423	(604)	(180)	236	3,204	0	3,204	(3,148)
2039	430	(614)	(184)	240	3,376	0	3,376	(3,320)
2040	437	(624)	(187)	244	3,548	0	3,548	(3,492)

3. Rain Barrels
    a. In Region M, utilities could save approximately 13.1 gallons per year per gallon of capacity rebated, sold, or distributed (GDS Associates, 2002).
    b. Estimated 10-year useful life for most barrels

Statewide Water Conservation Quantification Project
City of Mission Report • 2017

1 Introduction

In Texas' 2017 State Water Plan, municipal water conservation is projected to meet 9.6 percent[1] of the state's future water needs by 2070. According to the 16 regional water plans that comprise the state water plan, this is expected to be achieved through a variety of measures such as installation of water efficient plumbing fixtures, water conservation pricing structures, water system audits, landscape irrigation ordinances, as well as other water conservation activities. The 9.6 percent is "in addition to the estimated share of future passive conservation savings from plumbing codes and water efficiency standards, which are embedded in municipal water demand projections" (Texas Water Development Board, 2017).

In 2015, the Texas Legislature appropriated funds to the Texas Water Development Board (TWDB) to fund a research project principally charged with quantitatively determining the savings of municipal water conservation activities being implemented in relation to the recommended conservation goals (supply volumes) in the State Water Plan. As part of the project, individual reports were completed for all participating utilities.

With this report, utilities will benefit by receiving a clear and concise picture of its water conservation goals alongside estimated savings from quantifiable activities. In the event that current activity savings may not be able to reach long-term goals, this report offers suggestions on how utilities can reach water conservation goals with activities that are effective, easily adopted, have widespread appeal, and are quantifiable.

2 Municipal Conservation Terminology and Review of Methodology Used by Regional Planners

To make use of the results of this study, it is important to understand several key terms used in the water planning process.

What is a water user group?

In this report, a water user group (WUG) refers to a retail water provider in the form a city, municipal utility district, water control and improvement district, special utility district, water supply corporation, fresh water supply district, or other type of water utility. The TWDB further defines WUGs as one of the following (Texas Water Development Board, 2016b):

- Cities and towns with a population of 500 or more
- Non-city utilities providing more than 280 acre-feet per year per year of water for municipal use
- Collective reporting units (CRUs) consisting of grouped utilities having a common association

[1] Equal to 811,224 acre-feet per year in conservation savings.

- County-Wide WUGs:
    - County-Other (Rural/unincorporated areas of municipal water use)
    - Manufacturing
    - Steam electric power generation

What is a recommended water management strategy?

A recommended water management strategy (WMS) is a measure that will help ensure WUGs have adequate water supplies for their end users well into the future. WMS examples include river diversions, groundwater use, reservoir and aquifer development, and irrigation conservation. When WMS is referred to in this report, it refers only to municipal conservation, which may include water loss reduction as a part of the same strategy.

What is a WMS supply volume?

A WMS supply volume is the amount of water that a given strategy is expected to yield each decade in the planning period if carried out by the WUG. In this report, a WMS supply volume is the amount of water recommended to come from municipal water conservation.

Some regional water plans separate this strategy's supply volume into a volume for municipal water conservation and a volume for water loss reduction for each decade. The total strategy supply volume is the sum of both. A regional water plan may also refer to "advanced conservation" as part of this strategy. Advanced conservation usually indicates that the volume could be achieved through a more robust mix of conservation activities described in the plan.

2.1 Regional Planning Group Approach to Determining Supply Volumes

Each regional water planning group (RWPG) is responsible for producing its own individual plan that, if executed, will provide sufficient water to its WUGs throughout a 50-year planning period. These plans are completed in five-year cycles, with the most recent edition being completed in 2016. The 2016 regional plans make up the 2017 State Water Plan, which sets out WMS supply volumes for the years 2020 through 2070.

The decadal WMS supply volumes for municipal conservation were established by each of the RWPGs in much the same manner. The RWPGs generally followed the guidelines of the Texas Legislature's Water Conservation Implementation Task Force on the pace utilities should target to reduce gallons per capita per day (GPCD)[2] consumption levels.

The targeted reductions used by most regions follow this formula:

- For municipal WUGs with water use of 140 GPCD and greater, the goal is to reduce per capita water use by one percent per year until the level of 140 GPCD is reached,

[2] Regional water planning GPCD is defined as the annual volume of water pumped, diverted, or purchased minus the volume exported (sold) to other water systems or large industrial facilities divided by the permanent resident population of the Municipal Water User Group in the regional water planning process divided by 365. Saline and reused/recycled water are not included in this volume (Texas Water Development Board, 2012).

after which, the goal is to reduce per capita water use by one-fourth percent per year for the remainder of the planning period (Texas Water Development Board, 2016j).

The yearly reductions in GPCD for a given WUG are then converted into recommended supply volumes in acre-feet per year for each decade as the reductions in consumption continue. Some regions reduce GPCD by slightly different percentages before and after the 140 GPCD threshold, some do not apply further reductions in GPCD for WUGs once they reach 140 GPCD, while others recommend only "advanced conservation" activities once WUGs meet 140 GPCD.

2.2 Methodology

In order to complete a uniform quantification process, the first engagement was with utilities that agreed to participate and collected as much relevant data as possible. These data included, among many others, historical GPCD consumption figures, advanced metering infrastructure (AMI) specifications, and detailed feedback on each conservation activity being implemented. Personal interviews focused on determining when and to what extent these activities were being employed, as well as assessing plans to continue such conservation. Examples of frequently implemented activities include tiered water rate conservation pricing, strategic water rate increases, outdoor irrigation audits and ordinances, and rain barrel distribution.

Subsequently, each utility's conservation activities were quantified through several different means, including evidence-based studies, utility field results and savings determinations, manufacturer guarantees, water loss audits, TWDB studies, and other information that assigned a savings value to the activity's implementation.

Every conservation activity studied and quantified has a gallons-per-year estimate, useful life, and decay rate (if applicable) associated with it. Some activities' savings are projected to grow as demand grows over time, while some savings are constant each year and subside once useful life has run its course. For expanded methodology and details on studies and formulas used to determine activity savings, refer to Section 6 of the State Report included as part of this document.

Once analyzed, the resulting savings estimates from each utility were compared with the recommended WMS supply volumes in its respective regional plan to determine if the savings met, exceeded, or fell short of those volumes. Individual utility savings were aggregated to compare with regional volumes, and regional savings were aggregated to compare with state volumes.

It is important to note that this report quantified activity savings—not including water loss reduction—for the WMS supply volume comparison dating back to 2012. The reason for this is, with a few exceptions, the regional planners used 2011 as the base year for establishing potential WMS supply volumes.[3] In addition, any conservation savings achieved through 2011 are assumed to be accounted for in the regional water planning GPCD for that year.[4] Thus, quantifying from 2012 and forward is the most accurate way to determine if utilities are meeting

[3] Confirmed via personal communication with Region C, H, K, and L Plan consultants.
[4] It was established with TWDB planning staff that 2011 GPCD levels were chosen because they represented the most current water use and conservation patterns at the time.

the recommended conservation volumes in the regional plans. This assumption is by no means 100 percent accurate, however. Some previously implemented activities' savings persist into future years beyond this starting point, while some activities' savings have ceased. One year's GPCD will not necessarily include all savings yielded by conservation activities that came before it, but the quantification assessment must have a starting point.

2.3 Quantifiable Savings

The key to the project being useful and reliable is that the results from year to year are measurable. Quantifying conservation activities that can be accurately measured provides greater certainty and better planning for all stakeholders.

While many utilities are engaged in a variety of conservation activities, not all can currently be properly measured. Some examples of these activities include education initiatives, website and social media engagement, and enforcement for water waste. That does not mean these measures are not essential. Education of consumers, for example, is a fundamental activity that makes all others effective, but little hard data exists to quantify the results of education alone.

In addition, the work of conservation coordinators can have a particularly significant effect on the savings of all other activities, but the specific savings attributed to that staff role is difficult to quantify.

3 Results

This report compares Mission's current water conservation activities and their quantified savings to two metrics: 1) Region M Water Plan's (Texas Water Development Board, 2016k) recommended WMS supply volumes for municipal conservation, and 2) Mission's own 5- and 10-year goals as established in its most recent water conservation plan submitted to the TWDB.

The WMS supply volumes for municipal water conservation are laid out by decade (2020 – 2070) in the regional water plans to serve as benchmarks for what each utility could achieve via that strategy during a 50-year planning period.[5]

The 5- and 10-year goals in Mission's most recent water conservation plan are established by the utility as realistic targets for reducing consumption over that timeframe. These reductions[6] are expressed in decreasing total GPCD[7] consumption and water loss GPCD.[8] [9]

The estimated savings in Tables 3-1 through 3-3 indicate the best information available as

[5] Some regional water plans separate this strategy volume into a volume for water conservation and a volume for water loss reduction for each decade. The total strategy volume is the sum of both.
[6] Occasionally, some utilities expect consumption to increase due to various reasons, such as an incoming industrial presence expected to raise consumption figures for the entire service area.
[7] As defined in TWDB water conservation plan annual report (Texas Water Development Board, 2016o): (Total Gallons in System ÷ Permanent Population) ÷ 365
[8] These plans also have targets for residential GPCD and water loss as a percentage (rather than GPCD), but this report does not address those goals.
[9] As defined in TWDB water conservation plan annual report (Texas Water Development Board, 2016o): (Total Water Loss ÷ Permanent Population) ÷ 365

provided by utility staff. Some ongoing activities may not be known and are within a utility's service area are implemented on a micro-scale that may not be quantified. Individual households and businesses may be implementing conservation measures that are unknown and therefore cannot be included in the report.

Explanation of approach to assessing water loss reduction savings

Water loss reduction savings are defined as the volume of water participating utilities are realizing from their water loss mitigation efforts. For this report, this value is the difference between each individual utility's baseline[10] for water loss GPCD and its most recent water loss GPCD reported in 2015 water loss audits on file with TWDB. Savings from all water loss reduction efforts—including pipe replacements and leak repair—are assumed to be included in this comparison to a utility's baseline.

Note that because a single year (2015) value was used for comparison, it is possible that the 2015 value could be anomalous due to a number of events that may have occurred that year, such as a water main break, a particularly wet year, or a robust effort by the utility to curtail water loss. This will distort future savings figures that were carried forward in the study because water loss will inevitably increase or decrease in later years.

Ideally, using a rolling five-year average in the calculation would correct such anomalies. However, there was insufficient data to do that for every utility. The approach was to use the most complete water loss data possible, which was represented by the 2015 water loss audit. This problem will be further minimized, as continued data collection will allow five-year averages to be calculated for a majority of utilities.

In this way, water loss savings estimates are different from all other activity savings estimates in the project. Whether savings were positive or negative depended on where individual utilities established their own baselines or where their five-year average started, and what water loss GPCD value was reported in 2015.

3.1 Current Savings Compared to Conservation WMS Supply Volume (in million gallons) in Regional Water Plan

Table 3-1 shows a 2070 outlook for Mission with the utility's yearly recommended WMS supply volume in million gallons (MG) alongside its water savings from implemented activities, including from water loss reduction. These activities and their associated savings are covered in greater detail in Sections 4 and 5.

Starting in 2015, this table compares all quantified conservation activity and the recommended conservation WMS supply volume for the planning period. The following definitions pair with the column headers in Table 3-1.

<u>Actual Current Conservation Activity Savings</u> – All quantified activities currently being performed by the utility, *excluding* savings from water loss reduction. The regional planners used

---

[10] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.

2011 GPCD as the baseline for determining future conservation WMS supply volumes, therefore the study quantifies utility savings starting in 2012 for this comparison.

Actual Water Loss Reduction Savings (as of 2015) – The difference between the baseline[11] for water loss GPCD and most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB. [12] The summary of these savings can be referenced in Table 5-1.

Total Savings from All Conservation Activity – Actual Current Conservation Activity Savings plus Actual Water Loss Reduction Savings (as of 2015).

Conservation WMS Volume – The recommended municipal water conservation supply volume in the regional plan for the decades ranging from 2020 to 2070. These volumes are converted to MG from the values listed in the plan in acre-feet and then calculated in annual increments.

Water Loss Reduction WMS Volume – Some regional water plans have a separate WMS volume for water conservation and for water loss reduction for each decade. If a WUG's regional plan has a WMS volume for water loss reduction, this column will have values other than zero.

Total Yearly WMS Volume – The sum of the Conservation WMS Volume and Water Loss Reduction WMS Volume.

Over (Short) – The amount that the utility's Total Savings from All Conservation Activity (since 2012), is over or below the Total Yearly WMS Volume in the regional water plan. If the amount falls below the WMS volume, it will appear in parentheses.

[11] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.
[12] If water loss GPCD has increased from the utility's baseline or historic five-year average to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount.

Table 3-1. Current Savings Compared to Conservation WMS Supply Volume (MG) in Regional Water Plan.

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)

3.2 Utility Water Conservation Plan Goals – Total GPCD

Table 3-2 shows how Mission's quantified savings from its implemented activities compare with 5- and 10-year goals established in its individual water conservation plan submitted to the TWDB. The following definitions pair with the column headers in Table 3-2.

Utility Population – Estimated utility service area population for the years indicated.

Total GPCD Goals – Total GPCD goals start with the utility's baseline[13] for total GPCD and progress in subsequent years to match five- and 10-year goals indicated in a utility's five-year water conservation plan on file with the TWDB. The first five annual GPCD goals were developed by spreading the difference between the baseline and five-year goal evenly over five years. The second five annual GPCD goals spread the difference between the five-year goal and 10-year goal evenly over the next five years.

Annual Savings Goal with Reduction in GPCD (MG) – This column shows what reductions from the baseline GPCD would yield in terms of volume each year as more water is saved. The volumes indicated here are what target GPCD goals look like expressed in million gallons. Annual volumes were derived using the formula: (baseline total GPCD – target total GPCD for that year) x 365 days ÷ 1,000,000 gallons.

Total Savings for All Current Quantified Activities (MG) – Total quantified savings for all current conservation activities and savings from water loss reduction.

Over (Short) – The amount that the utility's total quantified savings for all current conservation activities (since 2012), including water loss reduction, is over or below the volume represented by reductions in GPCD each year. If the quantified savings are less than these target volumes, the value will appear in parentheses.

Table 3-2. Utility Water Conservation Plan Goals — Total GPCD.

Year #	Year	Utility Population	Total GPCD Goals	Annual Savings Goal with Reduction in GPCD (MG)	Total Savings for All Current Quantified Activities (MG)	Over (Short) (MG)
0	**Baseline**	-	150	0	0	0
1	2015	83,298	148	46	426	380
2	2016	86,170	147	94	440	346
3	2017	89,042	145	146	455	309
4	2018	91,914	144	201	470	268
5-year Goal	2019	94,786	142	259	484	225
6	2020	97,658	141	310	499	189
7	2021	100,019	140	361	511	150
8	2022	102,379	138	415	523	108
9	2023	104,740	137	470	535	65
10-year Goal	2024	107,100	136	528	547	20

[13] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for total GPCD from the utility's most recently submitted five-year water conservation plan was used.

3.3 Utility Water Conservation Plan Goals – Water Loss GPCD

Table 3-3 shows how Mission's most recent water loss audit compares with five- and 10-year water loss goals in its water conservation plan. The following definitions pair with the column headers in Table 3-2.

Utility Population – Estimated utility service area population for the years indicated.

Water Loss GPCD Goals – Water loss GPCD goals start with the utility's baseline[14] for water loss GPCD and progress in subsequent years to match 5- and 10-year water loss goals indicated in a utility's five-year water conservation plan on file with the TWDB. The first five annual GPCD goals were developed by spreading the difference between the baseline and five-year goal evenly over five years. The second five annual GPCD goals spread the difference between the five-year goal and 10-year goal evenly over the next five years.

Yearly Savings Goal with Reduction in GPCD (MG) – This column shows what reductions from the baseline water loss GPCD would yield in terms of volume each year as more water is saved. The volumes indicated here are what target water loss GPCD goals look like expressed in million gallons. Annual volumes were derived using the formula: (baseline water loss GPCD – target water loss GPCD for that year) x 365 days ÷ 1,000,000 gallons.

Total Savings from Water Loss Reduction (MG) – The difference between a utility's established baseline for water loss GPCD and the most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB. If water loss GPCD has increased from the utility's baseline to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount. Reference Table 5-1 for savings from water loss reduction.

Over (Short) – The amount that the utility's total savings from water loss reduction is over or below the volume represented by reductions in GPCD each year. If water loss reduction savings are less than these target volumes, the value will appear in parentheses.

Table 3-3. Utility Water Conservation Plan Goals — Water Loss GPCD.

Year #	Year	Utility Population	Water Loss GPCD Goals	Yearly Savings Goal with Reduction in GPCD (MG)	Total Savings from Water Loss Reduction (MG)	Over (Short) (MG)
0	**Baseline**	-	24.00	0	0	0
1	2015	83,298	23.76	7	426	418
2	2016	86,170	23.52	15	440	425
3	2017	89,042	23.28	23	455	432
4	2018	91,914	23.04	32	470	437
5-year Goal	2019	94,786	22.80	42	484	443
6	2020	97,658	22.56	51	499	448
7	2021	100,019	22.32	61	511	450
8	2022	102,379	22.08	72	523	451
9	2023	104,740	21.84	83	535	453
10-year Goal	2024	107,100	21.60	94	547	453

[14] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.

4 Implemented Activities

Below is a list of completed activities with estimated water savings. Note that drought response and other measures are not included in the utility's water savings because they are temporary, awareness-based or not able to be accurately quantified on an annual basis.

These are not savings projections of potential future activities. Estimated savings are based on measures that have actually been implemented. If savings are shown to persist in future years, it is because the measure is permanent, such as an ordinance, or the savings are assumed to continue for the reason listed under the itemized activity. Estimated savings from water rate increases are the one exception to these conditions.

Water Rate Increases

Savings from water rate increases were included because entities such as the U.S. Environmental Protection Agency and others indicate specific savings for utilities that raise rates (Texas Water Development Board, 2013; U.S. E.P.A., 1998; Whitcomb, 1999). This project includes surveys of several utilities that have minimal education efforts, perform no other substantive conservation activities, and yet experienced significant demand reduction that coincided with rate increases. In those cases, savings estimates matched up closely with decreases in total GPCD. For many smaller utilities, especially those with customers lacking disposable income, this measure is the only tool used to conserve other than water loss reduction.

The following assumptions were made for water rate increases:

- The model assumes that savings persist into future years because it is expected that the utility will continue to make periodic rate increases in line with the percentage increases from previous years.
- Only the last two rate increases for a utility were quantified.
- Savings grow with demand because as new customers enter the service area, they are assumed to adhere to the same price elasticity model estimates.
- A weighted average for savings was used when rate increases differed between residential and industrial-commercial-institutional (ICI) customers based on the individual utility's customer class breakdown.
- When a utility raised rates using tiered rate conservation pricing, a 50/50 savings split was used when increases differed between base and volumetric rates.
    - The reasoning is that all customers must react to the base increase, yet the pricing signal is stronger when volumetric rate increases affect the higher usage customers.
    - The 50/50 split is reasonable because many customers will not reach the higher volumetric tiers.
    - Studies show that most customers do not actually know they have reached the higher volumetric tiers; just that their bill has increased (Texas Water Development Board, 2013).

4.1 Itemized Activities

1. **Utility Website**
   a. Easy-to-use website with conservation tips and water rates
   b. Features contact information for Public Works staff and customer service

2. **Continuing Public Education**
   a. The utility engages the public in many ways including:
      i. Brochures, bill messages, displays, and exhibits

3. **Water Loss Reduction Savings**[15]
   a. Savings of 426 MG annually in 2015
   b. Water loss reduction savings = the difference between a utility's baseline[16] water loss GPCD submitted in its most recent 5-year water conservation plan and its most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB
   c. If water loss GPCD has increased from the utility's baseline or historic 5-year average to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount.
   d. All savings estimates grow each year at the same rate population figures for the utility grow in the regional water plan.

5 Summary of Savings

Table 5-1. Savings from Water Loss Reduction (MG).

Year	Utility Population	Water Loss GPCD	Total Savings from Water Loss Reduction (MG)
Baseline	-	24.00	0
2015	83,298	10.00	426
2016	86,170	10.00	440
2017	89,042	10.00	455
2018	91,914	10.00	470
2019	94,786	10.00	484
2020	97,658	10.00	499
2021	100,019	10.00	511
2022	102,379	10.00	523
2023	104,740	10.00	535
2024	107,100	10.00	547

[15] If current water loss levels exceed a utility's baseline, this vaue is treated as a deduction from total quantified savings.
[16] In the absence of having a baseline figure provided in the utility's most recently submitted 5-year water conservation plan, the historic 5-year average for water loss GPCD in the plan was used.

6 Suggested Activities

Up to four activities were chosen as potential suggested activities for individual reports. These activities are: AMI system with customer portal, twice-per-week (or less) outdoor watering ordinances, strategic water rate increases, and rain barrels.

Activities were chosen because they are:

- Achievable
- Prevalence of vendors that can actually implement them
- Acceptability to city councils, MUD boards, et al.
- Easily adopted
- Cost effective
- Yield high savings relative to cost

AMI systems with customer engagement portals were also chosen because they represent a profusion of future applications that will undoubtedly continue to advance conservation efforts. AMI and meter data management (MDM) companies are developing new and innovative ways to benefit water providers, customers, and ultimately states that are pushing conservation and usage analytics further.

Each utility should be cognizant of the potential impact that these suggested activities may have on its own unique rate and revenue situation.

Benefits to consider:

- Avoided water supply and wastewater costs
  - The higher water purchase, transmission, and distribution costs are, the greater the potential benefit realized when large amounts of water are conserved with these activities.
- Avoided system expansion costs
  - Conserving water may allow a utility to postpone building new system capacity by decreasing demand even as population grows.

Costs to consider:

- Staff time and resources
- Unit cost per unit saved
- Implementation costs
- Stakeholder agreement and support
- Other overhead and budget considerations

6.1 Suggested Activities with Savings Estimates

1. Twice-a-week Outdoor Watering Restriction Ordinance

a. Potentially 5.05% savings of total demand (Hermitte and Mace, 2012; Sierra Club-Lone Star Chapter and National Wildlife Federation, 2015)
   i. Average Region M savings
   ii. Specific percentage of outdoor usage unknown for your utility at this time
b. Savings could be 303 MG per year with current demand.
c. See Table 6-1 for potential savings from this measure compared with the city's WMS supply volumes targets.

Table 6-1. Current Savings + Potential Savings from 2x per Week Watering Ordinance (MG).

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Potential Savings from Ordinance	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)
2016	0	440	440	303	167	0	167	576
2017	0	455	455	310	167	0	167	598
2018	0	470	470	318	201	0	201	587
2019	0	484	484	325	234	0	234	575
2020	0	499	499	333	301	0	301	530
2021	0	511	511	340	371	0	371	481
2022	0	523	523	347	440	0	440	431

2. Advanced Metering Infrastructure with Customer Engagement Portal

These portals, along with mobile applications and billing statements, can provide customers with much more access to their water use data in simple and compelling formats. This access and comparison with other customers' usage can reduce water use through changed behavior, as well as provide an opportunity for other conservation programs to be offered to the customer for increased adoption and additional savings. AMI systems support leak notification and web portals with real-time data. Any water loss reduction savings that these systems also yield were included in the water loss assessment of individual reports for this project.

a. Specific utility results will vary based on portal features and frequency of customer notifications
b. Potential savings estimate assumes 20% of residential customers will use and save water due to the portal (Westin Engineering, 2015)

c. Estimate assumes customers will save 10% of total annual use due to the portal
   i. Savings estimate of 10% is an average of results from multiple studies (Chesnutt and Mitchell, 2013; East Bay Municipal Utility District, 2014; IBM, 2011; Texas A&M and Texas Water Resources Institute, 2016; Westin Engineering, 2015)
d. Residential customers' use assumed to make up approximately 67% of all retail customers' use based on utility profile information submitted to the TWDB
   i. This was the most common percentage of residential use among participating utilities in this project.
   ii. Actual customer class demand percentages will vary by utility.
e. 20% of residential customers saving 10% with this customer class breakdown amounts to 1.34% of total demand
f. Savings are assumed to increase along with demand as connections increase each year[17]
g. See Table 6-2 for potential savings from this measure compared with the utility's WMS supply volumes targets.

Table 6-2. Current Savings + Potential Savings from AMI with Customer Portal (MG).

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Potential Savings from AMI with Customer Portal	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)
2016	0	440	440	80	167	0	167	353

2028	0	596	596	104	854	0	854	(155)
2029	0	608	608	106	924	0	924	(210)
2030	0	620	620	108	993	0	993	(265)
2031	0	632	632	110	1,085	0	1,085	(343)
2032	0	644	644	112	1,177	0	1,177	(421)
2033	0	656	656	114	1,269	0	1,269	(499)
2034	0	668	668	116	1,361	0	1,361	(577)
2035	0	680	680	118	1,454	0	1,454	(655)
2036	0	692	692	120	1,546	0	1,546	(733)
2037	0	704	704	122	1,638	0	1,638	(812)
2038	0	717	717	124	1,730	0	1,730	(890)
2039	0	729	729	126	1,822	0	1,822	(968)
2040	0	741	741	128	1,914	0	1,914	(1,046)

[17] The 10% consumption reduction figure for 20% of residential customers is conservative, but savings could be greater when monitored yearly as customer engagement increases.

3. Water Rate Increase
    a. For every 10% increase, estimated savings could be 2% of utility total demand.
    b. Approximately 120 MG of savings per year with current demand
    c. Savings is cumulative and based on more than one source[18] (U.S. EPA, 1998; Whitcomb, 1999)
    d. See Table 6-3 for potential savings (4%) from this measure compared with the utility's conservation goals.

Table 6-3. Current Savings + Potential Savings from 10% Water Rate Increase (MG).

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Potential Savings from Water Rate Increase	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)

2035	0	680	680	176	1,454	0	1,454	(597)
2036	0	692	692	179	1,546	0	1,546	(674)
2037	0	704	704	182	1,638	0	1,638	(751)
2038	0	717	717	185	1,730	0	1,730	(829)
2039	0	729	729	188	1,822	0	1,822	(906)
2040	0	741	741	191	1,914	0	1,914	(983)

4. Rain Barrels
    a. In Region M, utilities could save approximately 13.1 gallons per year per gallon of capacity rebated, sold, or distributed (GDS Associates, 2002).
    b. Estimated 10-year useful life for most barrels

[18] The study estimates a 2% demand reduction with 10% increase in price on a targeted customer class. By applying a ratio, it is possible to determine the savings for lower or higher percentage increases.
.

Statewide Water Conservation Quantification Project
North Alamo WSC Report • 2017

1 Introduction

In Texas' 2017 State Water Plan, municipal water conservation is projected to meet 9.6 percent[1] of the state's future water needs by 2070. According to the 16 regional water plans that comprise the state water plan, this is expected to be achieved through a variety of measures such as installation of water efficient plumbing fixtures, water conservation pricing structures, water system audits, landscape irrigation ordinances, as well as other water conservation activities. The 9.6 percent is "in addition to the estimated share of future passive conservation savings from plumbing codes and water efficiency standards, which are embedded in municipal water demand projections" (Texas Water Development Board, 2017).

In 2015, the Texas Legislature appropriated funds to the Texas Water Development Board (TWDB) to fund a research project principally charged with quantitatively determining the savings of municipal water conservation activities being implemented in relation to the recommended conservation goals (supply volumes) in the State Water Plan. As part of the project, individual reports were completed for all participating utilities.

With this report, utilities will benefit by receiving a clear and concise picture of its water conservation goals alongside estimated savings from quantifiable activities. In the event that current activity savings may not be able to reach long-term goals, this report offers suggestions on how utilities can reach water conservation goals with activities that are effective, easily adopted, have widespread appeal, and are quantifiable.

2 Municipal Conservation Terminology and Review of Methodology Used by Regional Planners

To make use of the results of this study, it is important to understand several key terms used in the water planning process.

What is a water user group?

In this report, a water user group (WUG) refers to a retail water provider in the form a city, municipal utility district, water control and improvement district, special utility district, water supply corporation, fresh water supply district, or other type of water utility. The TWDB further defines WUGs as one of the following (Texas Water Development Board, 2016b):

- Cities and towns with a population of 500 or more
- Non-city utilities providing more than 280 acre-feet per year per year of water for municipal use
- Collective reporting units (CRUs) consisting of grouped utilities having a common association

[1] Equal to 811,224 acre-feet per year in conservation savings.

- County-Wide WUGs:
    - County-Other (Rural/unincorporated areas of municipal water use)
    - Manufacturing
    - Steam electric power generation

What is a recommended water management strategy?

A recommended water management strategy (WMS) is a measure that will help ensure WUGs have adequate water supplies for their end users well into the future. WMS examples include river diversions, groundwater use, reservoir and aquifer development, and irrigation conservation. When WMS is referred to in this report, it refers only to municipal conservation, which may include water loss reduction as a part of the same strategy.

What is a WMS supply volume?

A WMS supply volume is the amount of water that a given strategy is expected to yield each decade in the planning period if carried out by the WUG. In this report, a WMS supply volume is the amount of water recommended to come from municipal water conservation.

Some regional water plans separate this strategy's supply volume into a volume for municipal water conservation and a volume for water loss reduction for each decade. The total strategy supply volume is the sum of both. A regional water plan may also refer to "advanced conservation" as part of this strategy. Advanced conservation usually indicates that the volume could be achieved through a more robust mix of conservation activities described in the plan.

2.1 Regional Planning Group Approach to Determining Supply Volumes

Each regional water planning group (RWPG) is responsible for producing its own individual plan that, if executed, will provide sufficient water to its WUGs throughout a 50-year planning period. These plans are completed in five-year cycles, with the most recent edition being completed in 2016. The 2016 regional plans make up the 2017 State Water Plan, which sets out WMS supply volumes for the years 2020 through 2070.

The decadal WMS supply volumes for municipal conservation were established by each of the RWPGs in much the same manner. The RWPGs generally followed the guidelines of the Texas Legislature's Water Conservation Implementation Task Force on the pace utilities should target to reduce gallons per capita per day (GPCD)[2] consumption levels.

The targeted reductions used by most regions follow this formula:

- For municipal WUGs with water use of 140 GPCD and greater, the goal is to reduce per capita water use by one percent per year until the level of 140 GPCD is reached,

[2] Regional water planning GPCD is defined as the annual volume of water pumped, diverted, or purchased minus the volume exported (sold) to other water systems or large industrial facilities divided by the permanent resident population of the Municipal Water User Group in the regional water planning process divided by 365. Saline and reused/recycled water are not included in this volume (Texas Water Development Board, 2012).

after which, the goal is to reduce per capita water use by one-fourth percent per year for the remainder of the planning period (Texas Water Development Board, 2016j).

The yearly reductions in GPCD for a given WUG are then converted into recommended supply volumes in acre-feet per year for each decade as the reductions in consumption continue. Some regions reduce GPCD by slightly different percentages before and after the 140 GPCD threshold, some do not apply further reductions in GPCD for WUGs once they reach 140 GPCD, while others recommend only "advanced conservation" activities once WUGs meet 140 GPCD.

2.2 Methodology

In order to complete a uniform quantification process, the first engagement was with utilities that agreed to participate and collected as much relevant data as possible. These data included, among many others, historical GPCD consumption figures, advanced metering infrastructure (AMI) specifications, and detailed feedback on each conservation activity being implemented. Personal interviews focused on determining when and to what extent these activities were being employed, as well as assessing plans to continue such conservation. Examples of frequently implemented activities include tiered water rate conservation pricing, strategic water rate increases, outdoor irrigation audits and ordinances, and rain barrel distribution.

Subsequently, each utility's conservation activities were quantified through several different means, including evidence-based studies, utility field results and savings determinations, manufacturer guarantees, water loss audits, TWDB studies, and other information that assigned a savings value to the activity's implementation.

Every conservation activity studied and quantified has a gallons-per-year estimate, useful life, and decay rate (if applicable) associated with it. Some activities' savings are projected to grow as demand grows over time, while some savings are constant each year and subside once useful life has run its course. For expanded methodology and details on studies and formulas used to determine activity savings, refer to Section 6 of the State Report included as part of this document.

Once analyzed, the resulting savings estimates from each utility were compared with the recommended WMS supply volumes in its respective regional plan to determine if the savings met, exceeded, or fell short of those volumes. Individual utility savings were aggregated to compare with regional volumes, and regional savings were aggregated to compare with state volumes.

It is important to note that this report quantified activity savings—not including water loss reduction—for the WMS supply volume comparison dating back to 2012. The reason for this is, with a few exceptions, the regional planners used 2011 as the base year for establishing potential WMS supply volumes.[3] In addition, any conservation savings achieved through 2011 are assumed to be accounted for in the regional water planning GPCD for that year.[4] Thus, quantifying from 2012 and forward is the most accurate way to determine if utilities are meeting

[3] Confirmed via personal communication with Region C, H, K, and L Plan consultants.
[4] It was established with TWDB planning staff that 2011 GPCD levels were chosen because they represented the most current water use and conservation patterns at the time.

the recommended conservation volumes in the regional plans. This assumption is by no means 100 percent accurate, however. Some previously implemented activities' savings persist into future years beyond this starting point, while some activities' savings have ceased. One year's GPCD will not necessarily include all savings yielded by conservation activities that came before it, but the quantification assessment must have a starting point.

2.3 Quantifiable Savings

The key to the project being useful and reliable is that the results from year to year are measurable. Quantifying conservation activities that can be accurately measured provides greater certainty and better planning for all stakeholders.

While many utilities are engaged in a variety of conservation activities, not all can currently be properly measured. Some examples of these activities include education initiatives, website and social media engagement, and enforcement for water waste. That does not mean these measures are not essential. Education of consumers, for example, is a fundamental activity that makes all others effective, but little hard data exists to quantify the results of education alone.

In addition, the work of conservation coordinators can have a particularly significant effect on the savings of all other activities, but the specific savings attributed to that staff role is difficult to quantify.

3 Results

This report compares North Alamo WSC's current water conservation activities and their quantified savings to two metrics: 1) Region M Water Plan's (Texas Water Development Board, 2016k) recommended WMS supply volumes for municipal conservation, and 2) North Alamo WSC's own 5- and 10-year goals as established in its most recent water conservation plan submitted to the TWDB.

The WMS supply volumes for municipal water conservation are laid out by decade (2020 – 2070) in the regional water plans to serve as benchmarks for what each utility could achieve via that strategy during a 50-year planning period.[5]

The 5- and 10-year goals in North Alamo WSC's most recent water conservation plan are established by the utility as realistic targets for reducing consumption over that timeframe. These reductions[6] are expressed in decreasing total GPCD [7] consumption and water loss GPCD.[8] [9]

---

[5] Some regional water plans separate this strategy volume into a volume for water conservation and a volume for water loss reduction for each decade. The total strategy volume is the sum of both.

[6] Occasionally, some utilities expect consumption to increase due to various reasons, such as an incoming industrial presence expected to raise consumption figures for the entire service area.

[7] As defined in TWDB water conservation plan annual report (Texas Water Development Board, 2016o): (Total Gallons in System ÷ Permanent Population) ÷ 365

[8] These plans also have targets for residential GPCD and water loss as a percentage (rather than GPCD), but this report does not address those goals.

[9] As defined in TWDB water conservation plan annual report (Texas Water Development Board, 2016o): (Total Water Loss ÷ Permanent Population) ÷ 365

The estimated savings in Tables 3-1 through 3-3 indicate the best information available as provided by utility staff. Some ongoing activities may not be known and are within a utility's service area are implemented on a micro-scale that may not be quantified. Individual households and businesses may be implementing conservation measures that are unknown and therefore cannot be included in the report.

Explanation of approach to assessing water loss reduction savings

Water loss reduction savings are defined as the volume of water participating utilities are realizing from their water loss mitigation efforts. For this report, this value is the difference between each individual utility's baseline[10] for water loss GPCD and its most recent water loss GPCD reported in 2015 water loss audits on file with TWDB. Savings from all water loss reduction efforts—including pipe replacements and leak repair—are assumed to be included in this comparison to a utility's baseline.

Note that because a single year (2015) value was used for comparison, it is possible that the 2015 value could be anomalous due to a number of events that may have occurred that year, such as a water main break, a particularly wet year, or a robust effort by the utility to curtail water loss. This will distort future savings figures that were carried forward in the study because water loss will inevitably increase or decrease in later years.

Ideally, using a rolling five-year average in the calculation would correct such anomalies. However, there was insufficient data to do that for every utility. The approach was to use the most complete water loss data possible, which was represented by the 2015 water loss audit. This problem will be further minimized, as continued data collection will allow five-year averages to be calculated for a majority of utilities.

In this way, water loss savings estimates are different from all other activity savings estimates in the project. Whether savings were positive or negative depended on where individual utilities established their own baselines or where their five-year average started, and what water loss GPCD value was reported in 2015.

3.1 Current Savings Compared to Conservation WMS Supply Volume (in million gallons) in Regional Water Plan

Table 3-1 shows the 2070 outlook for North Alamo WSC with the utility's yearly recommended WMS supply volume in million gallons (MG) alongside its water savings from implemented activities, including from water loss reduction. These activities and their associated savings are covered in greater detail in Sections 4 and 5.

Starting in 2015, this table compares all quantified conservation activity and the recommended conservation WMS supply volume for the planning period. The following definitions pair with the column headers in Table 3-1.

Actual Current Conservation Activity Savings – All quantified activities currently being

[10] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.

performed by the utility, *excluding* savings from water loss reduction. The regional planners used 2011 GPCD as the baseline for determining future conservation WMS supply volumes, therefore the study quantifies utility savings starting in 2012 for this comparison. The summary of these savings can be referenced in Table 5-1.

Actual Water Loss Reduction Savings (as of 2015) – The difference between the baseline[11] for water loss GPCD and most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB. [12] The summary of these savings can be referenced in Table 5-2.

Total Savings from All Conservation Activity – Actual Current Conservation Activity Savings plus Actual Water Loss Reduction Savings (as of 2015).

Conservation WMS Volume – The recommended municipal water conservation supply volume in the regional plan for the decades ranging from 2020 to 2070. These volumes are converted to MG from the values listed in the plan in acre-feet and then calculated in annual increments.

Water Loss Reduction WMS Volume – Some regional water plans have a separate WMS volume for water conservation and for water loss reduction for each decade. If a WUG's regional plan has a WMS volume for water loss reduction, this column will have values other than zero.

Total Yearly WMS Volume – The sum of the Conservation WMS Volume and Water Loss Reduction WMS Volume.

Over (Short) – The amount that the utility's Total Savings from All Conservation Activity (since 2012), is over or below the Total Yearly WMS Volume in the regional water plan. If the amount falls below the WMS volume, it will appear in parentheses.

[11] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.
[12] If water loss GPCD has increased from the utility's baseline or historic five-year average to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount.

Table 3-1. Current Savings Compared to Conservation WMS Supply Volume (MG) in Regional Water Plan.

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)

2068	185	234	419	3,579	0	3,579	(3,160)
2069	187	236	423	3,680	0	3,680	(3,257)
2070	189	239	428	3,781	0	3,781	(3,353)

3.2 Utility Water Conservation Plan Goals – Total GPCD

Table 3-2 shows how North Alamo WSC's quantified savings from its implemented activities compare with 5- and 10-year goals established in its individual water conservation plan submitted to the TWDB. The following definitions pair with the column headers in Table 3-2.

Utility Population – Estimated utility service area population for the years indicated.

Total GPCD Goals – Total GPCD goals start with the utility's baseline[13] for total GPCD and progress in subsequent years to match 5- and 10-year goals indicated in a utility's five-year water conservation plan on file with the TWDB. The first five annual GPCD goals were developed by spreading the difference between the baseline and five-year goal evenly over five years. The second five annual GPCD goals spread the difference between the five-year goal and 10-year goal evenly over the next five years.

Annual Savings Goal with Reduction in GPCD (MG) – This column shows what reductions from the baseline GPCD would yield in terms of volume each year as more water is saved. The volumes indicated here are what target GPCD goals look like expressed in million gallons. Annual volumes were derived using the formula: (baseline total GPCD – target total GPCD for that year) x 365 days ÷ 1,000,000 gallons.

Total Savings for All Current Quantified Activities (MG) – Total quantified savings for all current conservation activities and savings from water loss reduction. Refer to Tables 5-1 and 5-2 for details on these savings.

Over (Short) – The amount that the utility's total quantified savings for all current conservation activities (since 2012), including water loss reduction, is over or below the volume represented by reductions in GPCD each year. If the quantified savings are less than these target volumes, the value will appear in parentheses.

Table 3-2. Utility Water Conservation Plan Goals — Total GPCD.

Year #	Year	Utility Population	Total GPCD Goals	Annual Savings Goal with Reduction in GPCD (MG)	Total Savings for All Current Quantified Activities (MG)	Over (Short) (MG)
0	Baseline	-	160	0	0	0
1	2015	130,308	159	48	95	48
2	2016	133,874	158	98	180	82
3	2017	137,440	157	150	185	34
4	2018	141,006	156	206	189	(17)
5-year Goal	2019	144,572	155	264	194	(70)
6	2020	148,138	154	324	198	(126)
7	2021	151,719	153	388	203	(185)
8	2022	155,299	152	453	207	(246)
9	2023	158,880	151	522	212	(310)
10-year Goal	2024	162,461	150	593	216	(377)

[13] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for total GPCD from the utility's most recently submitted five-year water conservation plan was used.

3.3 Utility Water Conservation Plan Goals – Water Loss GPCD

Table 3-3 shows how North Alamo WSC's most recent water loss audit compares with five- and 10-year water loss goals in its water conservation plan. The following definitions pair with the column headers in Table 3-2.

Utility Population – Estimated utility service area population for the years indicated.

Water Loss GPCD Goals – Water loss GPCD goals start with the utility's baseline[14] for water loss GPCD and progress in subsequent years to match 5- and 10-year water loss goals indicated in a utility's five-year water conservation plan on file with the TWDB. The first five annual GPCD goals were developed by spreading the difference between the baseline and five-year goal evenly over five years. The second five annual GPCD goals spread the difference between the five-year goal and 10-year goal evenly over the next five years.

Yearly Savings Goal with Reduction in GPCD (MG) – This column shows what reductions from the baseline water loss GPCD would yield in terms of volume each year as more water is saved. The volumes indicated here are what target water loss GPCD goals look like expressed in million gallons. Annual volumes were derived using the formula: (baseline water loss GPCD – target water loss GPCD for that year) x 365 days ÷ 1,000,000 gallons.

Total Savings from Water Loss Reduction (MG) – The difference between a utility's established baseline for water loss GPCD and the most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB. If water loss GPCD has increased from the utility's baseline to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount. Reference Table 5-2 for savings from water loss reduction.

Over (Short) – The amount that the utility's total savings from water loss reduction is over or below the volume represented by reductions in GPCD each year. If water loss reduction savings are less than these target volumes, the value will appear in parentheses.

Table 3-3. Utility Water Conservation Plan Goals — Water Loss GPCD.

Year #	Year	Utility Population	Water Loss GPCD Goals	Yearly Savings Goal with Reduction in GPCD (MG)	Total Savings from Water Loss Reduction (MG)	Over (Short) (MG)
0	**Baseline**	-	26.00	0	0	0
1	2015	130,308	25.60	19	95	76
2	2016	133,874	25.20	39	98	59
3	2017	137,440	24.80	60	100	40
4	2018	141,006	24.40	82	103	21
5-year Goal	2019	144,572	24.00	106	106	0
6	2020	148,138	23.00	162	108	(54)
7	2021	151,719	22.00	222	111	(111)
8	2022	155,299	21.00	283	113	(170)
9	2023	158,880	20.00	348	116	(232)
10-year Goal	2024	162,461	19.00	415	119	(296)

[14] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.

4 Implemented Activities

Below is a list of completed activities with estimated water savings. Note that drought response and other measures are not included in the utility's water savings because they are temporary, awareness-based or not able to be accurately quantified on an annual basis.

These are not savings projections of potential future activities. Estimated savings are based on measures that have actually been implemented. If savings are shown to persist in future years, it is because the measure is permanent, such as an ordinance, or the savings are assumed to continue for the reason listed under the itemized activity. Estimated savings from water rate increases are the one exception to these conditions.

Water Rate Increases

Savings from water rate increases were included because entities such as the U.S. Environmental Protection Agency and others indicate specific savings for utilities that raise rates (Texas Water Development Board, 2013; U.S. E.P.A., 1998; Whitcomb, 1999). This project includes surveys of several utilities that have minimal education efforts, perform no other substantive conservation activities, and yet experienced significant demand reduction that coincided with rate increases. In those cases, savings estimates matched up closely with decreases in total GPCD. For many smaller utilities, especially those with customers lacking disposable income, this measure is the only tool used to conserve other than water loss reduction.

The following assumptions were made for water rate increases:

- The model assumes that savings persist into future years because it is expected that the utility will continue to make periodic rate increases in line with the percentage increases from previous years.
- Only the last two rate increases for a utility were quantified.
- Savings grow with demand because as new customers enter the service area, they are assumed to adhere to the same price elasticity model estimates.
- A weighted average for savings was used when rate increases differed between residential and industrial-commercial-institutional (ICI) customers based on the individual utility's customer class breakdown.
- When a utility raised rates using tiered rate conservation pricing, a 50/50 savings split was used when increases differed between base and volumetric rates.
    - The reasoning is that all customers must react to the base increase, yet the pricing signal is stronger when volumetric rate increases affect the higher usage customers.
    - The 50/50 split is reasonable because many customers will not reach the higher volumetric tiers.
    - Studies show that most customers do not actually know they have reached the higher volumetric tiers; just that their bill has increased (Texas Water Development Board, 2013).

4.1 Itemized Activities

1. **Utility Website**
    a. Easy-to-use website with conservation tips and water rates
    b. Features contact information for Public Works staff and customer service

2. **Continuing Public Education**
    a. The utility engages the public in many ways including:
        i. Brochures, bill messages, displays, and exhibits

3. **Water Loss Reduction Savings**[15]
    a. Savings of 95 MG annually in 2015
    b. Water loss reduction savings = the difference between a utility's baseline[16] water loss GPCD submitted in its most recent 5-year water conservation plan and its most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB
    c. If water loss GPCD has increased from the utility's baseline or historic 5-year average to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount.
    d. All savings estimates grow each year at the same rate population figures for the utility grow in the regional water plan.

4. **Water Rate Increase**
    a. Last rate increase:[17]
        i. 5.5% increase in 2016
    b. Estimated customer demand reduction of 1.1%
    c. Savings is cumulative and based on more than one source[18] (U.S. EPA, 1998; Whitcomb, 1999)
    d. Savings from rate increases are shown to persist over time, however, note that savings from these pricing signals will likely decrease if rates remain the same in future years.

---

[15] If current water loss levels exceed a utility's baseline, this value is treated as a deduction from total quantified savings.
[16] In the absence of having a baseline figure provided in the utility's most recently submitted 5-year water conservation plan, the historic 5-year average for water loss GPCD in the plan was used.
[17] Correspondence with utility staff.
[18] The study estimates a 2% demand reduction with 10% increase in price on a targeted customer class. By applying a ratio, it is possible to determine the savings for lower or higher percentage increases

5 Summary of Savings

Table 5-1. Savings by Water Conservation Activity (MG).

Year	Water Rate Increase	TOTAL SAVINGS
2012		0
2013		0
2014		0
2015		0
2016	82.3	82
2017	84.2	84
2018	86.1	86
2019	88.0	88
2020	89.9	90
2021	91.8	92
2022	93.7	94
2023	95.7	96
2024	97.6	98
2025	99.5	99
2026	101.4	101
2027	103.3	103
2028	105.2	105
2029	107.1	107

2065	179.2	179
2066	181.1	181
2067	183.1	183
2068	185.1	185
2069	187.1	187
2070	189.1	189

Table 5-2. Savings from Water Loss Reduction (MG).

Year	Utility Population	Water Loss GPCD	Total Savings from Water Loss Reduction
Baseline	-	26.00	0
2015	130,308	24.00	95
2016	133,874	24.00	98
2017	137,440	24.00	100
2018	141,006	24.00	103
2019	144,572	24.00	106
2020	148,138	24.00	108
2021	151,719	24.00	111
2022	155,299	24.00	113
2023	158,880	24.00	116
2024	162,461	24.00	119

6 Suggested Activities

Up to four activities were chosen as potential suggested activities for individual reports. These activities are: AMI system with customer portal, twice-per-week (or less) outdoor watering ordinances, strategic water rate increases, and rain barrels.

Activities were chosen because they are:

- Achievable
- Prevalence of vendors that can actually implement them
- Acceptability to city councils, MUD boards, et al.
- Easily adopted
- Cost effective
- Yield high savings relative to cost

AMI systems with customer engagement portals were also chosen because they represent a profusion of future applications that will undoubtedly continue to advance conservation efforts. AMI and meter data management (MDM) companies are developing new and innovative ways to benefit water providers, customers, and ultimately states that are pushing conservation and usage analytics further.

Each utility should be cognizant of the potential impact that these suggested activities may have on its own unique rate and revenue situation.

Benefits to consider:

- Avoided water supply and wastewater costs
    - The higher water purchase, transmission, and distribution costs are, the greater the potential benefit realized when large amounts of water are conserved with these activities.
- Avoided system expansion costs
    - Conserving water may allow a utility to postpone building new system capacity by decreasing demand even as population grows.

Costs to consider:

- Staff time and resources
- Unit cost per unit saved
- Implementation costs
- Stakeholder agreement and support
- Other overhead and budget considerations

6.1 Suggested Activities with Savings Estimates

1. Twice-a-week Outdoor Watering Restriction Ordinance
   a. Potentially 5.05% savings of total demand (Hermitte and Mace, 2012; Sierra Club-Lone Star Chapter and National Wildlife Federation, 2015)
      i. Average Region M savings
      ii. Specific percentage of outdoor usage unknown for your utility at this time
   b. Savings could be 378 MG per year with current demand.
   c. See Table 6-1 for potential savings from this measure compared with the city's WMS supply volumes targets.

Table 6-1. Current Savings + Potential Savings from 2x per Week Watering Ordinance (MG).

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Potential Savings from Ordinance	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)
2016	82	98	180	378	156	0	156	402
2017	84	100	185	386	156	0	156	415
2018	86	103	189	395	187	0	187	397
2019	88	106	194	404	218	0	218	380
2020	90	108	198	413	280	0	280	331
2021	92	111	203	422	315	0	315	309
2022	94	113	207	430	350	0	350	288
2023	96	116	212	439	384	0	384	266
2024	98	119	216	448	419	0	419	245
2025	99	121	221	457	454	0	454	224
2026	101	124	225	466	489	0	489	202
2027	103	126	230	474	523	0	523	181
2028	105	129	234	483	558	0	558	159
2029	107	132	239	492	593	0	593	138
2030	109	134	243	501	627	0	627	117
2031	111	137	248	510	681	0	681	76
2032	113	140	253	519	736	0	736	36
2033	115	142	257	528	790	0	790	(5)
2034	117	145	262	537	844	0	844	(45)
2035	119	147	266	546	898	0	898	(86)
2036	121	150	271	555	952	0	952	(127)
2037	123	153	275	564	1,006	0	1,006	(167)
2038	125	155	280	573	1,060	0	1,060	(208)
2039	127	158	285	582	1,115	0	1,115	(248)
2040	129	161	289	591	1,169	0	1,169	(289)

2. Advanced Metering Infrastructure with Customer Engagement Portal

These portals, along with mobile applications and billing statements, can provide customers with much more access to their water use data in simple and compelling formats. This access and comparison with other customers' usage can reduce water use through changed behavior, as well as provide an opportunity for other conservation programs to be offered to the customer for increased adoption and additional savings. AMI systems support leak notification and web portals with real-time data. Any water loss reduction savings that these systems also yield were included in the water loss assessment of individual reports for this project.

- **a.** Specific utility results will vary based on portal features and frequency of customer notifications
- **b.** Potential savings estimate assumes 20% of residential customers will use and save water due to the portal (Westin Engineering, 2015)
- **c.** Estimate assumes customers will save 10% of total annual use due to the portal
    - i. Savings estimate of 10% is an average of results from multiple studies (Chesnutt and Mitchell, 2013; East Bay Municipal Utility District, 2014; IBM, 2011; Texas A&M and Texas Water Resources Institute, 2016; Westin Engineering, 2015)
- **d.** Residential customers' use assumed to make up approximately 67% of all retail customers' use based on utility profile information submitted to the TWDB
    - i. This was the most common percentage of residential use among participating utilities in this project.
    - ii. Actual customer class demand percentages will vary by utility.
- **e.** 20% of residential customers saving 10% with this customer class breakdown amounts to 1.34% of total demand
- **f.** Savings are assumed to increase along with demand as connections increase each year[19]
- **g.** See Table 6-2 for potential savings from this measure compared with the utility's WMS supply volumes targets.

[19] The 10% consumption reduction figure for 20% of residential customers is conservative, but savings could be greater when monitored yearly as customer engagement increases.

Table 6-2. Current Savings + Potential Savings from AMI with Customer Portal (MG).

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Potential Savings from AMI with Customer Portal	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)
2016	82	98	180	100	156	0	156	124

3. Rain Barrels
   a. In Region M, utilities could save approximately 13.1 gallons per year per gallon of capacity rebated, sold, or distributed (GDS Associates, 2002).
   b. Estimated 10-year useful life for most barrels

Statewide Water Conservation Quantification Project
Olmito WSC Report • 2017

1 Introduction

In Texas' 2017 State Water Plan, municipal water conservation is projected to meet 9.6 percent[1] of the state's future water needs by 2070. According to the 16 regional water plans that comprise the state water plan, this is expected to be achieved through a variety of measures such as installation of water efficient plumbing fixtures, water conservation pricing structures, water system audits, landscape irrigation ordinances, as well as other water conservation activities. The 9.6 percent is "in addition to the estimated share of future passive conservation savings from plumbing codes and water efficiency standards, which are embedded in municipal water demand projections" (Texas Water Development Board, 2017).

In 2015, the Texas Legislature appropriated funds to the Texas Water Development Board (TWDB) to fund a research project principally charged with quantitatively determining the savings of municipal water conservation activities being implemented in relation to the recommended conservation goals (supply volumes) in the State Water Plan. As part of the project, individual reports were completed for all participating utilities.

With this report, utilities will benefit by receiving a clear and concise picture of its water conservation goals alongside estimated savings from quantifiable activities. In the event that current activity savings may not be able to reach long-term goals, this report offers suggestions on how utilities can reach water conservation goals with activities that are effective, easily adopted, have widespread appeal, and are quantifiable.

2 Municipal Conservation Terminology and Review of Methodology Used by Regional Planners

To make use of the results of this study, it is important to understand several key terms used in the water planning process.

What is a water user group?

In this report, a water user group (WUG) refers to a retail water provider in the form a city, municipal utility district, water control and improvement district, special utility district, water supply corporation, fresh water supply district, or other type of water utility. The TWDB further defines WUGs as one of the following (Texas Water Development Board, 2016b):

- Cities and towns with a population of 500 or more
- Non-city utilities providing more than 280 acre-feet per year per year of water for municipal use
- Collective reporting units (CRUs) consisting of grouped utilities having a common association

[1] Equal to 811,224 acre-feet per year in conservation savings.

- County-Wide WUGs:
  - County-Other (Rural/unincorporated areas of municipal water use)
  - Manufacturing
  - Steam electric power generation

What is a recommended water management strategy?

A recommended water management strategy (WMS) is a measure that will help ensure WUGs have adequate water supplies for their end users well into the future. WMS examples include river diversions, groundwater use, reservoir and aquifer development, and irrigation conservation. When WMS is referred to in this report, it refers only to municipal conservation, which may include water loss reduction as a part of the same strategy.

What is a WMS supply volume?

A WMS supply volume is the amount of water that a given strategy is expected to yield each decade in the planning period if carried out by the WUG. In this report, a WMS supply volume is the amount of water recommended to come from municipal water conservation.

Some regional water plans separate this strategy's supply volume into a volume for municipal water conservation and a volume for water loss reduction for each decade. The total strategy supply volume is the sum of both. A regional water plan may also refer to "advanced conservation" as part of this strategy. Advanced conservation usually indicates that the volume could be achieved through a more robust mix of conservation activities described in the plan.

2.1 Regional Planning Group Approach to Determining Supply Volumes

Each regional water planning group (RWPG) is responsible for producing its own individual plan that, if executed, will provide sufficient water to its WUGs throughout a 50-year planning period. These plans are completed in five-year cycles, with the most recent edition being completed in 2016. The 2016 regional plans make up the 2017 State Water Plan, which sets out WMS supply volumes for the years 2020 through 2070.

The decadal WMS supply volumes for municipal conservation were established by each of the RWPGs in much the same manner. The RWPGs generally followed the guidelines of the Texas Legislature's Water Conservation Implementation Task Force on the pace utilities should target to reduce gallons per capita per day (GPCD)[2] consumption levels.

The targeted reductions used by most regions follow this formula:

- For municipal WUGs with water use of 140 GPCD and greater, the goal is to reduce per capita water use by one percent per year until the level of 140 GPCD is reached,

[2] Regional water planning GPCD is defined as the annual volume of water pumped, diverted, or purchased minus the volume exported (sold) to other water systems or large industrial facilities divided by the permanent resident population of the Municipal Water User Group in the regional water planning process divided by 365. Saline and reused/recycled water are not included in this volume (Texas Water Development Board, 2012).

after which, the goal is to reduce per capita water use by one-fourth percent per year for the remainder of the planning period (Texas Water Development Board, 2016j).

The yearly reductions in GPCD for a given WUG are then converted into recommended supply volumes in acre-feet per year for each decade as the reductions in consumption continue. Some regions reduce GPCD by slightly different percentages before and after the 140 GPCD threshold, some do not apply further reductions in GPCD for WUGs once they reach 140 GPCD, while others recommend only "advanced conservation" activities once WUGs meet 140 GPCD.

2.2 Methodology

In order to complete a uniform quantification process, the first engagement was with utilities that agreed to participate and collected as much relevant data as possible. These data included, among many others, historical GPCD consumption figures, advanced metering infrastructure (AMI) specifications, and detailed feedback on each conservation activity being implemented. Personal interviews focused on determining when and to what extent these activities were being employed, as well as assessing plans to continue such conservation. Examples of frequently implemented activities include tiered water rate conservation pricing, strategic water rate increases, outdoor irrigation audits and ordinances, and rain barrel distribution.

Subsequently, each utility's conservation activities were quantified through several different means, including evidence-based studies, utility field results and savings determinations, manufacturer guarantees, water loss audits, TWDB studies, and other information that assigned a savings value to the activity's implementation.

Every conservation activity studied and quantified has a gallons-per-year estimate, useful life, and decay rate (if applicable) associated with it. Some activities' savings are projected to grow as demand grows over time, while some savings are constant each year and subside once useful life has run its course. For expanded methodology and details on studies and formulas used to determine activity savings, refer to Section 6 of the State Report included as part of this document.

Once analyzed, the resulting savings estimates from each utility were compared with the recommended WMS supply volumes in its respective regional plan to determine if the savings met, exceeded, or fell short of those volumes. Individual utility savings were aggregated to compare with regional volumes, and regional savings were aggregated to compare with state volumes.

It is important to note that this report quantified activity savings—not including water loss reduction—for the WMS supply volume comparison dating back to 2012. The reason for this is, with a few exceptions, the regional planners used 2011 as the base year for establishing potential WMS supply volumes.[3] In addition, any conservation savings achieved through 2011 are assumed to be accounted for in the regional water planning GPCD for that year.[4] Thus, quantifying from 2012 and forward is the most accurate way to determine if utilities are meeting

[3] Confirmed via personal communication with Region C, H, K, and L Plan consultants.
[4] It was established with TWDB planning staff that 2011 GPCD levels were chosen because they represented the most current water use and conservation patterns at the time.

the recommended conservation volumes in the regional plans. This assumption is by no means 100 percent accurate, however. Some previously implemented activities' savings persist into future years beyond this starting point, while some activities' savings have ceased. One year's GPCD will not necessarily include all savings yielded by conservation activities that came before it, but the quantification assessment must have a starting point.

2.3 Quantifiable Savings

The key to the project being useful and reliable is that the results from year to year are measurable. Quantifying conservation activities that can be accurately measured provides greater certainty and better planning for all stakeholders.

While many utilities are engaged in a variety of conservation activities, not all can currently be properly measured. Some examples of these activities include education initiatives, website and social media engagement, and enforcement for water waste. That does not mean these measures are not essential. Education of consumers, for example, is a fundamental activity that makes all others effective, but little hard data exists to quantify the results of education alone.

In addition, the work of conservation coordinators can have a particularly significant effect on the savings of all other activities, but the specific savings attributed to that staff role is difficult to quantify.

3 Results

This report compares Olmito WSC's current water conservation activities and their quantified savings to two metrics: 1) Region M Water Plan's (Texas Water Development Board, 2016k) recommended WMS supply volumes for municipal conservation, and 2) Olmito WSC's own 5- and 10-year goals as established in its most recent water conservation plan submitted to the TWDB.

The WMS supply volumes for municipal water conservation are laid out by decade (2020 – 2070) in the regional water plans to serve as benchmarks for what each utility could achieve via that strategy during a 50-year planning period.[5]

The 5- and 10-year goals in Olmito WSC's most recent water conservation plan are established by the utility as realistic targets for reducing consumption over that timeframe. These reductions[6] are expressed in decreasing total GPCD [7] consumption and water loss GPCD.[8] [9]

---

[5] Some regional water plans separate this strategy volume into a volume for water conservation and a volume for water loss reduction for each decade. The total strategy volume is the sum of both.

[6] Occasionally, some utilities expect consumption to increase due to various reasons, such as an incoming industrial presence expected to raise consumption figures for the entire service area.

[7] As defined in TWDB water conservation plan annual report (Texas Water Development Board, 2016o): (Total Gallons in System ÷ Permanent Population) ÷ 365

[8] These plans also have targets for residential GPCD and water loss as a percentage (rather than GPCD), but this report does not address those goals.

[9] As defined in TWDB water conservation plan annual report (Texas Water Development Board, 2016o): (Total Water Loss ÷ Permanent Population) ÷ 365

The estimated savings in Tables 3-1 through 3-3 indicate the best information available as provided by utility staff. Some ongoing activities may not be known and are within a utility's service area are implemented on a micro-scale that may not be quantified. Individual households and businesses may be implementing conservation measures that are unknown and therefore cannot be included in the report.

Explanation of approach to assessing water loss reduction savings

Water loss reduction savings are defined as the volume of water participating utilities are realizing from their water loss mitigation efforts. For this report, this value is the difference between each individual utility's baseline[10] for water loss GPCD and its most recent water loss GPCD reported in 2015 water loss audits on file with TWDB. Savings from all water loss reduction efforts—including pipe replacements and leak repair—are assumed to be included in this comparison to a utility's baseline.

Note that because a single year (2015) value was used for comparison, it is possible that the 2015 value could be anomalous due to a number of events that may have occurred that year, such as a water main break, a particularly wet year, or a robust effort by the utility to curtail water loss. This will distort future savings figures that were carried forward in the study because water loss will inevitably increase or decrease in later years.

Ideally, using a rolling five-year average in the calculation would correct such anomalies. However, there was insufficient data to do that for every utility. The approach was to use the most complete water loss data possible, which was represented by the 2015 water loss audit. This problem will be further minimized, as continued data collection will allow five-year averages to be calculated for a majority of utilities.

In this way, water loss savings estimates are different from all other activity savings estimates in the project. Whether savings were positive or negative depended on where individual utilities established their own baselines or where their five-year average started, and what water loss GPCD value was reported in 2015.

3.1 Current Savings Compared to Conservation WMS Supply Volume (in million gallons) in Regional Water Plan

Table 3-1 shows the 2070 outlook for Olmito WSC with the utility's yearly recommended WMS supply volume in million gallons (MG) alongside its water savings from implemented activities, including from water loss reduction. These activities and their associated savings are covered in greater detail in Sections 4 and 5.

Starting in 2015, this table compares all quantified conservation activity and the recommended conservation WMS supply volume for the planning period. The following definitions pair with the column headers in Table 3-1.

<u>Actual Current Conservation Activity Savings</u> – All quantified activities currently being

[10] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.

performed by the utility, *excluding* savings from water loss reduction. The regional planners used 2011 GPCD as the baseline for determining future conservation WMS supply volumes, therefore the study quantifies utility savings starting in 2012 for this comparison.

Actual Water Loss Reduction Savings (as of 2015) – The difference between the baseline[11] for water loss GPCD and most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB. [12] The summary of these savings can be referenced in Table 5-1.

Total Savings from All Conservation Activity – Actual Current Conservation Activity Savings plus Actual Water Loss Reduction Savings (as of 2015).

Conservation WMS Volume – The recommended municipal water conservation supply volume in the regional plan for the decades ranging from 2020 to 2070. These volumes are converted to MG from the values listed in the plan in acre-feet and then calculated in annual increments.

Water Loss Reduction WMS Volume – Some regional water plans have a separate WMS volume for water conservation and for water loss reduction for each decade. If a WUG's regional plan has a WMS volume for water loss reduction, this column will have values other than zero.

Total Yearly WMS Volume – The sum of the Conservation WMS Volume and Water Loss Reduction WMS Volume.

Over (Short) – The amount that the utility's Total Savings from All Conservation Activity (since 2012), is over or below the Total Yearly WMS Volume in the regional water plan. If the amount falls below the WMS volume, it will appear in parentheses.

[11] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.
[12] If water loss GPCD has increased from the utility's baseline or historic five-year average to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount.

Table 3-1. Current Savings Compared to Conservation WMS Supply Volume (MG) in Regional Water Plan.

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)
2015	0	10.2	10	3	0	3	7
2016	0	9.6	10	4	0	4	6

3.2 Utility Water Conservation Plan Goals – Total GPCD

Table 3-2 shows how Olmito WSC's quantified savings from its implemented activities compare with 5- and 10-year goals established in its individual water conservation plan submitted to the TWDB. The following definitions pair with the column headers in Table 3-2.

Utility Population – Estimated utility service area population for the years indicated.

Total GPCD Goals – Total GPCD goals start with the utility's baseline[13] for total GPCD and progress in subsequent years to match 5- and 10-year goals indicated in a utility's five-year water conservation plan on file with the TWDB. The first five annual GPCD goals were developed by spreading the difference between the baseline and five-year goal evenly over five years. The second five annual GPCD goals spread the difference between the five-year goal and 10-year goal evenly over the next five years.

Annual Savings Goal with Reduction in GPCD (MG) – This column shows what reductions from the baseline GPCD would yield in terms of volume each year as more water is saved. The volumes indicated here are what target GPCD goals look like expressed in million gallons. Annual volumes were derived using the formula: (baseline total GPCD – target total GPCD for that year) x 365 days ÷ 1,000,000 gallons.

Total Savings for All Current Quantified Activities (MG) – Total quantified savings for all current conservation activities and savings from water loss reduction.

Over (Short) – The amount that the utility's total quantified savings for all current conservation activities (since 2012), including water loss reduction, is over or below the volume represented by reductions in GPCD each year. If the quantified savings are less than these target volumes, the value will appear in parentheses.

Table 3-2. Utility Water Conservation Plan Goals — Total GPCD.

Year #	Year	Utility Population	Total GPCD Goals	Annual Savings Goal with Reduction in GPCD (MG)	Total Savings for All Current Quantified Activities (MG)	Over (Short) (MG)
0	**Baseline**	-	161	0	0	0
1	2015	5,600	158	5	10	5
2	2016	5,273	156	10	10	(0)
3	2017	4,945	153	14	9	(5)
4	2018	4,618	151	18	8	(9)
5-year Goal	2019	4,290	148	20	8	(13)
6	2020	3,963	148	19	7	(12)
7	2021	4,030	147	20	7	(13)
8	2022	4,096	147	21	7	(14)
9	2023	4,163	146	22	8	(15)
10-year Goal	2024	4,230	146	23	8	(15)

[13] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for total GPCD from the utility's most recently submitted five-year water conservation plan was used.

3.3 Utility Water Conservation Plan Goals – Water Loss GPCD

Table 3-3 shows how Olmito WSC's most recent water loss audit compares with five- and 10-year water loss goals in its water conservation plan. The following definitions pair with the column headers in Table 3-2.

Utility Population – Estimated utility service area population for the years indicated.

Water Loss GPCD Goals – Water loss GPCD goals start with the utility's baseline[14] for water loss GPCD and progress in subsequent years to match 5- and 10-year water loss goals indicated in a utility's five-year water conservation plan on file with the TWDB. The first five annual GPCD goals were developed by spreading the difference between the baseline and five-year goal evenly over five years. The second five annual GPCD goals spread the difference between the five-year goal and 10-year goal evenly over the next five years.

Yearly Savings Goal with Reduction in GPCD (MG) – This column shows what reductions from the baseline water loss GPCD would yield in terms of volume each year as more water is saved. The volumes indicated here are what target water loss GPCD goals look like expressed in million gallons. Annual volumes were derived using the formula: (baseline water loss GPCD – target water loss GPCD for that year) x 365 days ÷ 1,000,000 gallons.

Total Savings from Water Loss Reduction (MG) – The difference between a utility's established baseline for water loss GPCD and the most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB. If water loss GPCD has increased from the utility's baseline to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount. Reference Table 5-1 for savings from water loss reduction.

Over (Short) – The amount that the utility's total savings from water loss reduction is over or below the volume represented by reductions in GPCD each year. If water loss reduction savings are less than these target volumes, the value will appear in parentheses.

Table 3-3. Utility Water Conservation Plan Goals — Water Loss GPCD.

Year #	Year	Utility Population	Water Loss GPCD Goals	Yearly Savings Goal with Reduction in GPCD (MG)	Total Savings from Water Loss Reduction (MG)	Over (Short) (MG)
0	**Baseline**	-	21.00	0	0	0
1	2015	5,600	18.20	6	10.2	4
2	2016	5,273	15.40	11	9.6	(1)
3	2017	4,945	12.60	15	9.0	(6)
4	2018	4,618	9.80	19	8.4	(10)
5-year Goal	2019	4,290	7.00	22	7.8	(14)
6	2020	3,963	6.80	21	7.2	(13)
7	2021	4,030	6.60	21	7.4	(14)
8	2022	4,096	6.40	22	7.5	(14)
9	2023	4,163	6.20	22	7.6	(15)
10-year Goal	2024	4,230	6.00	23	7.7	(15)

[14] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.

4 Implemented Activities

Below is a list of completed activities with estimated water savings. Note that drought response and other measures are not included in the utility's water savings because they are temporary, awareness-based or not able to be accurately quantified on an annual basis.

These are not savings projections of potential future activities. Estimated savings are based on measures that have actually been implemented. If savings are shown to persist in future years, it is because the measure is permanent, such as an ordinance, or the savings are assumed to continue for the reason listed under the itemized activity. Estimated savings from water rate increases are the one exception to these conditions.

Water Rate Increases

Savings from water rate increases were included because entities such as the U.S. Environmental Protection Agency and others indicate specific savings for utilities that raise rates (Texas Water Development Board, 2013; U.S. E.P.A., 1998; Whitcomb, 1999). This project includes surveys of several utilities that have minimal education efforts, perform no other substantive conservation activities, and yet experienced significant demand reduction that coincided with rate increases. In those cases, savings estimates matched up closely with decreases in total GPCD. For many smaller utilities, especially those with customers lacking disposable income, this measure is the only tool used to conserve other than water loss reduction.

The following assumptions were made for water rate increases:

- The model assumes that savings persist into future years because it is expected that the utility will continue to make periodic rate increases in line with the percentage increases from previous years.
- Only the last two rate increases for a utility were quantified.
- Savings grow with demand because as new customers enter the service area, they are assumed to adhere to the same price elasticity model estimates.
- A weighted average for savings was used when rate increases differed between residential and industrial-commercial-institutional (ICI) customers based on the individual utility's customer class breakdown.
- When a utility raised rates using tiered rate conservation pricing, a 50/50 savings split was used when increases differed between base and volumetric rates.
    - The reasoning is that all customers must react to the base increase, yet the pricing signal is stronger when volumetric rate increases affect the higher usage customers.
    - The 50/50 split is reasonable because many customers will not reach the higher volumetric tiers.
    - Studies show that most customers do not actually know they have reached the higher volumetric tiers; just that their bill has increased (Texas Water Development Board, 2013).

4.1 Itemized Activities

1. **Utility Website**
    a. Easy-to-use website with conservation tips and water rates
    b. Features contact information for Public Works staff and customer service

2. **Continuing Public Education**
    a. The utility engages the public in many ways including:
        i. Brochures, bill messages, displays, and exhibits

3. **Water Loss Reduction Savings**[15]
    a. Savings of 10.2 MG annually in 2015
    b. Water loss reduction savings = the difference between a utility's baseline[16] water loss GPCD submitted in its most recent 5-year water conservation plan and its most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB
    c. If water loss GPCD has increased from the utility's baseline or historic 5-year average to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount.
    d. All savings estimates grow each year at the same rate population figures for the utility grow in the regional water plan.

5 Summary of Savings

Table 5-1. Savings from Water Loss Reduction (MG).

Year	Utility Population	Water Loss GPCD	Total Savings from Water Loss Reduction
Baseline	-	21.00	0
2015	5,600	16.00	10
2016	5,273	16.00	10
2017	4,945	16.00	9
2018	4,618	16.00	8
2019	4,290	16.00	8
2020	3,963	16.00	7
2021	4,030	16.00	7
2022	4,096	16.00	7
2023	4,163	16.00	8
2024	4,230	16.00	8

[15] If current water loss levels exceed a utility's baseline, this value is treated as a deduction from total quantified savings.
[16] In the absence of having a baseline figure provided in the utility's most recently submitted 5-year water conservation plan, the historic 5-year average for water loss GPCD in the plan was used.

6 Suggested Activities

Up to four activities were chosen as potential suggested activities for individual reports. These activities are: AMI system with customer portal, twice-per-week (or less) outdoor watering ordinances, strategic water rate increases, and rain barrels.

Activities were chosen because they are:

- Achievable
- Prevalence of vendors that can actually implement them
- Acceptability to city councils, MUD boards, et al.
- Easily adopted
- Cost effective
- Yield high savings relative to cost

AMI systems with customer engagement portals were also chosen because they represent a profusion of future applications that will undoubtedly continue to advance conservation efforts. AMI and meter data management (MDM) companies are developing new and innovative ways to benefit water providers, customers, and ultimately states that are pushing conservation and usage analytics further.

Each utility should be cognizant of the potential impact that these suggested activities may have on its own unique rate and revenue situation.

Benefits to consider:

- Avoided water supply and wastewater costs
  - The higher water purchase, transmission, and distribution costs are, the greater the potential benefit realized when large amounts of water are conserved with these activities.
- Avoided system expansion costs
  - Conserving water may allow a utility to postpone building new system capacity by decreasing demand even as population grows.

Costs to consider:

- Staff time and resources
- Unit cost per unit saved
- Implementation costs
- Stakeholder agreement and support
- Other overhead and budget considerations

6.1 Suggested Activities with Savings Estimates

1. Twice-a-week Outdoor Watering Restriction Ordinance
   a. Potentially 5.05% savings of total demand (Hermitte and Mace, 2012; Sierra Club-Lone Star Chapter and National Wildlife Federation, 2015)

i. Average Region M savings
ii. Specific percentage of outdoor usage unknown for your utility at this time

b. Savings could be 11 MG per year with current demand.
c. See Table 6-1 for potential savings from this measure compared with the city's WMS supply volumes targets.

Table 6-1. Current Savings + Potential Savings from 2x per Week Watering Ordinance (MG).

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Potential Savings from Ordinance	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)
2016	0	10	10	11	4	0	4	17
2017	0	9	9	12	4	0	4	17
2018	0	8	8	12	5	0	5	15
2019	0	8	8	12	6	0	6	14
2020	0	7	7	12	7	0	7	12
2021	0	7	7	12	9	0	9	10
2022	0	7	7	12	11	0	11	9
2023	0	8	8	13	13	0	13	7
2024	0	8	8	13	15	0	15	5
2025	0	8	8	13	17	0	17	3
2026	0	8	8	13	19	0	19	2
2027	0	8	8	13	22	0	22	(0)
2028	0	8	8	13	24	0	24	(2)
2029	0	8	8	14	26	0	26	(4)
2030	0	8	8	14	28	0	28	(6)
2031	0	9	9	14	29	0	29	(7)
2032	0	9	9	14	31	0	31	(8)
2033	0	9	9	14	33	0	33	(10)
2034	0	9	9	14	35	0	35	(11)
2035	0	9	9	15	37	0	37	(13)
2036	0	9	9	15	38	0	38	(14)
2037	0	9	9	15	40	0	40	(16)
2038	0	9	9	15	42	0	42	(17)
2039	0	10	10	15	44	0	44	(19)
2040	0	10	10	15	46	0	46	(20)

2. Advanced Metering Infrastructure with Customer Engagement Portal

These portals, along with mobile applications and billing statements, can provide customers with much more access to their water use data in simple and compelling formats. This access and comparison with other customers' usage can reduce water use through changed behavior, as well as provide an opportunity for other conservation programs to be offered to the customer for increased adoption and additional savings. AMI systems support leak notification and web portals with real-time data. Any water loss reduction savings that these systems also yield were included in the water loss assessment of individual reports for this project.

a. Specific utility results will vary based on portal features and frequency of customer notifications
b. Potential savings estimate assumes 20% of residential customers will use and save water due to the portal (Westin Engineering, 2015)
c. Estimate assumes customers will save 10% of total annual use due to the portal

i. Savings estimate of 10% is an average of results from multiple studies (Chesnutt and Mitchell, 2013; East Bay Municipal Utility District, 2014; IBM, 2011; Texas A&M and Texas Water Resources Institute, 2016; Westin Engineering, 2015)

d. Residential customers' use assumed to make up approximately 67% of all retail customers' use based on utility profile information submitted to the TWDB

i. This was the most common percentage of residential use among participating utilities in this project.

ii. Actual customer class demand percentages will vary by utility.

e. 20% of residential customers saving 10% with this customer class breakdown amounts to 1.34% of total demand

f. Savings are assumed to increase along with demand as connections increase each year[17]

g. See Table 6-2 for potential savings from this measure compared with the utility's WMS supply volumes targets.

Table 6-2. Current Savings + Potential Savings from AMI with Customer Portal (MG).

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Potential Savings from AMI with Customer Portal	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)
2016	0	10	10	3	4	0	4	9
2017	0	9	9	3	4	0	4	8
2018	0	8	8	3	5	0	5	7
2019	0	8	8	3	6	0	6	5
2020	0	7	7	3	7	0	7	3
2021	0	7	7	3	9	0	9	1
2022	0	7	7	3	11	0	11	(1)
2023	0	8	8	3	13	0	13	(2)
2024	0	8	8	3	15	0	15	(4)
2025	0	8	8	3	17	0	17	(6)
2026	0	8	8	3	19	0	19	(8)
2027	0	8	8	4	22	0	22	(10)
2028	0	8	8	4	24	0	24	(12)
2029	0	8	8	4	26	0	26	(14)
2030	0	8	8	4	28	0	28	(16)
2031	0	9	9	4	29	0	29	(17)
2032	0	9	9	4	31	0	31	(19)
2033	0	9	9	4	33	0	33	(20)
2034	0	9	9	4	35	0	35	(22)
2035	0	9	9	4	37	0	37	(24)
2036	0	9	9	4	38	0	38	(25)
2037	0	9	9	4	40	0	40	(27)
2038	0	9	9	4	42	0	42	(29)
2039	0	10	10	4	44	0	44	(30)
2040	0	10	10	4	46	0	46	(32)

[17] The 10% consumption reduction figure for 20% of residential customers is conservative, but savings could be greater when monitored yearly as customer engagement increases.

3. Water Rate Increase
    a. For every 10% increase, estimated savings could be 2% of utility total demand.
    b. Approximately 5 MG of savings per year with current demand
    c. Savings is cumulative and based on more than one source[18] (U.S. EPA, 1998; Whitcomb, 1999)
    d. See Table 6-3 for potential savings from this measure compared with the utility's conservation goals.

Table 6-3. Current Savings + Potential Savings from 10% Water Rate Increase (MG).

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Potential Savings from Water Rate Increase	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)
2016	0	10	10	5	4	0	4	10
2017	0	9	9	5	4	0	4	10
2018	0	8	8	5	5	0	5	8

2022	0	7	7	5	11	0	11	1
2023	0	8	8	5	13	0	13	(1)
2024	0	8	8	5	15	0	15	(3)
2025	0	8	8	5	17	0	17	(4)
2026	0	8	8	5	19	0	19	(6)
2027	0	8	8	5	22	0	22	(8)
2028	0	8	8	5	24	0	24	(10)
2029	0	8	8	5	26	0	26	(12)
2030	0	8	8	5	28	0	28	(14)
2031	0	9	9	6	29	0	29	(15)
2032	0	9	9	6	31	0	31	(17)
2033	0	9	9	6	33	0	33	(19)
2034	0	9	9	6	35	0	35	(20)
2035	0	9	9	6	37	0	37	(22)
2036	0	9	9	6	38	0	38	(23)
2037	0	9	9	6	40	0	40	(25)
2038	0	9	9	6	42	0	42	(27)
2039	0	10	10	6	44	0	44	(28)
2040	0	10	10	6	46	0	46	(30)

4. Rain Barrels
    a. In Region M, utilities could save approximately 13.1 gallons per year per gallon of capacity rebated, sold, or distributed (GDS Associates, 2002).
    b. Estimated 10-year useful life for most barrels

[18] The study estimates a 2% demand reduction with 10% increase in price on a targeted customer class. By applying a ratio, it is possible to determine the savings for lower or higher percentage increases.

Statewide Water Conservation Quantification Project
City of Pharr Report • 2017

1 Introduction

In Texas' 2017 State Water Plan, municipal water conservation is projected to meet 9.6 percent[1] of the state's future water needs by 2070. According to the 16 regional water plans that comprise the state water plan, this is expected to be achieved through a variety of measures such as installation of water efficient plumbing fixtures, water conservation pricing structures, water system audits, landscape irrigation ordinances, as well as other water conservation activities. The 9.6 percent is "in addition to the estimated share of future passive conservation savings from plumbing codes and water efficiency standards, which are embedded in municipal water demand projections" (Texas Water Development Board, 2017).

In 2015, the Texas Legislature appropriated funds to the Texas Water Development Board (TWDB) to fund a research project principally charged with quantitatively determining the savings of municipal water conservation activities being implemented in relation to the recommended conservation goals (supply volumes) in the State Water Plan. As part of the project, individual reports were completed for all participating utilities.

With this report, utilities will benefit by receiving a clear and concise picture of its water conservation goals alongside estimated savings from quantifiable activities. In the event that current activity savings may not be able to reach long-term goals, this report offers suggestions on how utilities can reach water conservation goals with activities that are effective, easily adopted, have widespread appeal, and are quantifiable.

2 Municipal Conservation Terminology and Review of Methodology Used by Regional Planners

To make use of the results of this study, it is important to understand several key terms used in the water planning process.

What is a water user group?

In this report, a water user group (WUG) refers to a retail water provider in the form a city, municipal utility district, water control and improvement district, special utility district, water supply corporation, fresh water supply district, or other type of water utility. The TWDB further defines WUGs as one of the following (Texas Water Development Board, 2016b):

- Cities and towns with a population of 500 or more
- Non-city utilities providing more than 280 acre-feet per year per year of water for municipal use
- Collective reporting units (CRUs) consisting of grouped utilities having a common association

[1] Equal to 811,224 acre-feet per year in conservation savings.

- County-Wide WUGs:
    - County-Other (Rural/unincorporated areas of municipal water use)
    - Manufacturing
    - Steam electric power generation

What is a recommended water management strategy?

A recommended water management strategy (WMS) is a measure that will help ensure WUGs have adequate water supplies for their end users well into the future. WMS examples include river diversions, groundwater use, reservoir and aquifer development, and irrigation conservation. When WMS is referred to in this report, it refers only to municipal conservation, which may include water loss reduction as a part of the same strategy.

What is a WMS supply volume?

A WMS supply volume is the amount of water that a given strategy is expected to yield each decade in the planning period if carried out by the WUG. In this report, a WMS supply volume is the amount of water recommended to come from municipal water conservation.

Some regional water plans separate this strategy's supply volume into a volume for municipal water conservation and a volume for water loss reduction for each decade. The total strategy supply volume is the sum of both. A regional water plan may also refer to "advanced conservation" as part of this strategy. Advanced conservation usually indicates that the volume could be achieved through a more robust mix of conservation activities described in the plan.

2.1 Regional Planning Group Approach to Determining Supply Volumes

Each regional water planning group (RWPG) is responsible for producing its own individual plan that, if executed, will provide sufficient water to its WUGs throughout a 50-year planning period. These plans are completed in five-year cycles, with the most recent edition being completed in 2016. The 2016 regional plans make up the 2017 State Water Plan, which sets out WMS supply volumes for the years 2020 through 2070.

The decadal WMS supply volumes for municipal conservation were established by each of the RWPGs in much the same manner. The RWPGs generally followed the guidelines of the Texas Legislature's Water Conservation Implementation Task Force on the pace utilities should target to reduce gallons per capita per day (GPCD)[2] consumption levels.

The targeted reductions used by most regions follow this formula:

- For municipal WUGs with water use of 140 GPCD and greater, the goal is to reduce per capita water use by one percent per year until the level of 140 GPCD is reached,

[2] Regional water planning GPCD is defined as the annual volume of water pumped, diverted, or purchased minus the volume exported (sold) to other water systems or large industrial facilities divided by the permanent resident population of the Municipal Water User Group in the regional water planning process divided by 365. Saline and reused/recycled water are not included in this volume (Texas Water Development Board, 2012).

after which, the goal is to reduce per capita water use by one-fourth percent per year for the remainder of the planning period (Texas Water Development Board, 2016j).

The yearly reductions in GPCD for a given WUG are then converted into recommended supply volumes in acre-feet per year for each decade as the reductions in consumption continue. Some regions reduce GPCD by slightly different percentages before and after the 140 GPCD threshold, some do not apply further reductions in GPCD for WUGs once they reach 140 GPCD, while others recommend only "advanced conservation" activities once WUGs meet 140 GPCD.

2.2 Methodology

In order to complete a uniform quantification process, the first engagement was with utilities that agreed to participate and collected as much relevant data as possible. These data included, among many others, historical GPCD consumption figures, advanced metering infrastructure (AMI) specifications, and detailed feedback on each conservation activity being implemented. Personal interviews focused on determining when and to what extent these activities were being employed, as well as assessing plans to continue such conservation. Examples of frequently implemented activities include tiered water rate conservation pricing, strategic water rate increases, outdoor irrigation audits and ordinances, and rain barrel distribution.

Subsequently, each utility's conservation activities were quantified through several different means, including evidence-based studies, utility field results and savings determinations, manufacturer guarantees, water loss audits, TWDB studies, and other information that assigned a savings value to the activity's implementation.

Every conservation activity studied and quantified has a gallons-per-year estimate, useful life, and decay rate (if applicable) associated with it. Some activities' savings are projected to grow as demand grows over time, while some savings are constant each year and subside once useful life has run its course. For expanded methodology and details on studies and formulas used to determine activity savings, refer to Section 6 of the State Report included as part of this document.

Once analyzed, the resulting savings estimates from each utility were compared with the recommended WMS supply volumes in its respective regional plan to determine if the savings met, exceeded, or fell short of those volumes. Individual utility savings were aggregated to compare with regional volumes, and regional savings were aggregated to compare with state volumes.

It is important to note that this report quantified activity savings—not including water loss reduction—for the WMS supply volume comparison dating back to 2012. The reason for this is, with a few exceptions, the regional planners used 2011 as the base year for establishing potential WMS supply volumes.[3] In addition, any conservation savings achieved through 2011 are assumed to be accounted for in the regional water planning GPCD for that year.[4] Thus, quantifying from 2012 and forward is the most accurate way to determine if utilities are meeting

[3] Confirmed via personal communication with Region C, H, K, and L Plan consultants.
[4] It was established with TWDB planning staff that 2011 GPCD levels were chosen because they represented the most current water use and conservation patterns at the time.

the recommended conservation volumes in the regional plans. This assumption is by no means 100 percent accurate, however. Some previously implemented activities' savings persist into future years beyond this starting point, while some activities' savings have ceased. One year's GPCD will not necessarily include all savings yielded by conservation activities that came before it, but the quantification assessment must have a starting point.

2.3 Quantifiable Savings

The key to the project being useful and reliable is that the results from year to year are measurable. Quantifying conservation activities that can be accurately measured provides greater certainty and better planning for all stakeholders.

While many utilities are engaged in a variety of conservation activities, not all can currently be properly measured. Some examples of these activities include education initiatives, website and social media engagement, and enforcement for water waste. That does not mean these measures are not essential. Education of consumers, for example, is a fundamental activity that makes all others effective, but little hard data exists to quantify the results of education alone.

In addition, the work of conservation coordinators can have a particularly significant effect on the savings of all other activities, but the specific savings attributed to that staff role is difficult to quantify.

3 Results

This report compares Pharr's current water conservation activities and their quantified savings to two metrics: 1) Region M Water Plan's (Texas Water Development Board, 2016k) recommended WMS supply volumes for municipal conservation, and 2) Pharr's own five- and 10-year goals as established in its most recent water conservation plan submitted to the TWDB.

The WMS supply volumes for municipal water conservation are laid out by decade (2020 – 2070) in the regional water plans to serve as benchmarks for what each utility could achieve via that strategy during a 50-year planning period.[5]

The five- and 10-year goals in Pharr's most recent water conservation plan are established by the utility as realistic targets for reducing consumption over that timeframe. These reductions[6] are expressed in decreasing total GPCD[7] consumption and water loss GPCD.[8] [9]

The estimated savings in Tables 3-1 through 3-3 indicate the best information available as

[5] Some regional water plans separate this strategy volume into a volume for water conservation and a volume for water loss reduction for each decade. The total strategy volume is the sum of both.

[6] Occasionally, some utilities expect consumption to increase due to various reasons, such as an incoming industrial presence expected to raise consumption figures for the entire service area.

[7] As defined in TWDB water conservation plan annual report (Texas Water Development Board, 2016o): (Total Gallons in System ÷ Permanent Population) ÷ 365

[8] These plans also have targets for residential GPCD and water loss as a percentage (rather than GPCD), but this report does not address those goals.

[9] As defined in TWDB water conservation plan annual report (Texas Water Development Board, 2016o): (Total Water Loss ÷ Permanent Population) ÷ 365

provided by utility staff. Some ongoing activities may not be known and are within a utility's service area are implemented on a micro-scale that may not be quantified. Individual households and businesses may be implementing conservation measures that are unknown and therefore cannot be included in the report.

Explanation of approach to assessing water loss reduction savings

Water loss reduction savings are defined as the volume of water participating utilities are realizing from their water loss mitigation efforts. For this report, this value is the difference between each individual utility's baseline[10] for water loss GPCD and its most recent water loss GPCD reported in 2015 water loss audits on file with TWDB. Savings from all water loss reduction efforts—including pipe replacements and leak repair—are assumed to be included in this comparison to a utility's baseline.

Note that because a single year (2015) value was used for comparison, it is possible that the 2015 value could be anomalous due to a number of events that may have occurred that year, such as a water main break, a particularly wet year, or a robust effort by the utility to curtail water loss. This will distort future savings figures that were carried forward in the study because water loss will inevitably increase or decrease in later years.

Ideally, using a rolling five-year average in the calculation would correct such anomalies. However, there was insufficient data to do that for every utility. The approach was to use the most complete water loss data possible, which was represented by the 2015 water loss audit. This problem will be further minimized, as continued data collection will allow five-year averages to be calculated for a majority of utilities.

In this way, water loss savings estimates are different from all other activity savings estimates in the project. Whether savings were positive or negative depended on where individual utilities established their own baselines or where their five-year average started, and what water loss GPCD value was reported in 2015.

3.1 Current Savings Compared to Conservation WMS Supply Volume (in million gallons) in Regional Water Plan

Table 3-1 shows the 2070 outlook for Pharr with the utility's yearly recommended WMS supply volume in million gallons (MG) alongside its water savings from implemented activities, including from water loss reduction. These activities and their associated savings are covered in greater detail in Sections 4 and 5.

Starting in 2015, this table compares all quantified conservation activity and the recommended conservation WMS supply volume for the planning period. The following definitions pair with the column headers in Table 3-1.

Actual Current Conservation Activity Savings – All quantified activities currently being performed by the utility, *excluding* savings from water loss reduction. The regional planners used

[10] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.

2011 GPCD as the baseline for determining future conservation WMS supply volumes, therefore the study quantifies utility savings starting in 2012 for this comparison.

Actual Water Loss Reduction Savings (as of 2015) – The difference between the baseline[11] for water loss GPCD and most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB. [12] The summary of these savings can be referenced in Table 5-1.

Total Savings from All Conservation Activity – Actual Current Conservation Activity Savings plus Actual Water Loss Reduction Savings (as of 2015).

Conservation WMS Volume – The recommended municipal water conservation supply volume in the regional plan for the decades ranging from 2020 to 2070. These volumes are converted to MG from the values listed in the plan in acre-feet and then calculated in annual increments.

Water Loss Reduction WMS Volume – Some regional water plans have a separate WMS volume for water conservation and for water loss reduction for each decade. If a WUG's regional plan has a WMS volume for water loss reduction, this column will have values other than zero.

Total Yearly WMS Volume – The sum of the Conservation WMS Volume and Water Loss Reduction WMS Volume.

Over (Short) – The amount that the utility's Total Savings from All Conservation Activity (since 2012), is over or below the Total Yearly WMS Volume in the regional water plan. If the amount falls below the WMS volume, it will appear in parentheses.

[11] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.
[12] If water loss GPCD has increased from the utility's baseline or historic five-year average to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount.

Table 3-1. Current Savings Compared to Conservation WMS Supply Volume (MG) in Regional Water Plan.

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)

3.2 Utility Water Conservation Plan Goals – Total GPCD

Table 3-2 shows how Pharr's quantified savings from its implemented activities compare with 5- and 10-year goals established in its individual water conservation plan submitted to the TWDB. The following definitions pair with the column headers in Table 3-2.

Utility Population – Estimated utility service area population for the years indicated.

Total GPCD Goals – Total GPCD goals start with the utility's baseline[13] for total GPCD and progress in subsequent years to match 5- and 10-year goals indicated in a utility's five-year water conservation plan on file with the TWDB. The first five annual GPCD goals were developed by spreading the difference between the baseline and five-year goal evenly over five years. The second five annual GPCD goals spread the difference between the five-year goal and 10-year goal evenly over the next five years.

Annual Savings Goal with Reduction in GPCD (MG) – This column shows what reductions from the baseline GPCD would yield in terms of volume each year as more water is saved. The volumes indicated here are what target GPCD goals look like expressed in million gallons. Annual volumes were derived using the formula: (baseline total GPCD – target total GPCD for that year) x 365 days ÷ 1,000,000 gallons.

Total Savings for All Current Quantified Activities (MG) – Total quantified savings for all current conservation activities and savings from water loss reduction.

Over (Short) – The amount that the utility's total quantified savings for all current conservation activities (since 2012), including water loss reduction, is over or below the volume represented by reductions in GPCD each year. If the quantified savings are less than these target volumes, the value will appear in parentheses.

Table 3-2. Utility Water Conservation Plan Goals — Total GPCD.

Year #	Year	Utility Population	Total GPCD Goals	Annual Savings Goal with Reduction in GPCD (MG)	Total Savings for All Current Quantified Activities (MG)	Over (Short) (MG)
0	**Baseline**	-	95	0	0	0
1	2015	76,538	99	(112)	28	140
2	2016	79,074	103	(231)	29	260
3	2017	81,611	107	(357)	30	387
4	2018	84,147	111	(491)	31	522
5-year Goal	2019	86,684	115	(633)	32	664
6	2020	89,220	112	(554)	33	586
7	2021	91,377	109	(467)	33	500
8	2022	93,533	106	(376)	34	410
9	2023	95,690	103	(279)	35	314
10-year Goal	2024	97,846	100	(179)	36	214

[13] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for total GPCD from the utility's most recently submitted five-year water conservation plan was used.

3.3 Utility Water Conservation Plan Goals – Water Loss GPCD

Table 3-3 shows how Pharr's most recent water loss audit compares with 5- and 10-year water loss goals in its water conservation plan. The following definitions pair with the column headers in Table 3-2.

Utility Population – Estimated utility service area population for the years indicated.

Water Loss GPCD Goals – Water loss GPCD goals start with the utility's baseline[14] for water loss GPCD and progress in subsequent years to match 5- and 10-year water loss goals indicated in a utility's five-year water conservation plan on file with the TWDB. The first five annual GPCD goals were developed by spreading the difference between the baseline and five-year goal evenly over five years. The second five annual GPCD goals spread the difference between the five-year goal and 10-year goal evenly over the next five years

Yearly Savings Goal with Reduction in GPCD (MG) – This column shows what reductions from the baseline water loss GPCD would yield in terms of volume each year as more water is saved. The volumes indicated here are what target water loss GPCD goals look like expressed in million gallons. Annual volumes were derived using the formula: (baseline water loss GPCD – target water loss GPCD for that year) x 365 days ÷ 1,000,000 gallons.

Total Savings from Water Loss Reduction (MG) – The difference between a utility's established baseline for water loss GPCD and the most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB. If water loss GPCD has increased from the utility's baseline to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount. Reference Table 5-1 for savings from water loss reduction.

Over (Short) – The amount that the utility's total savings from water loss reduction is over or below the volume represented by reductions in GPCD each year. If water loss reduction savings are less than these target volumes, the value will appear in parentheses.

Table 3-3. Utility Water Conservation Plan Goals — Water Loss GPCD.

Year #	Year	Utility Population	Water Loss GPCD Goals	Yearly Savings Goal with Reduction in GPCD (MG)	Total Savings from Water Loss Reduction (MG)	Over (Short) (MG)
0	**Baseline**	-	7.00	0	0	0
1	2015	76,538	7.80	(22)	28	50
2	2016	79,074	8.60	(46)	29	75
3	2017	81,611	9.40	(71)	30	101
4	2018	84,147	10.20	(98)	31	129
5-year Goal	2019	86,684	11.00	(127)	32	158
6	2020	89,220	10.40	(111)	33	143
7	2021	91,377	9.80	(93)	33	127
8	2022	93,533	9.20	(75)	34	109
9	2023	95,690	8.60	(56)	35	91
10-year Goal	2024	97,846	8.00	(36)	36	71

[14] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.

4 Implemented Activities

Below is a list of completed activities with estimated water savings. Note that drought response and other measures are not included in the utility's water savings because they are temporary, awareness-based or not able to be accurately quantified on an annual basis.

These are not savings projections of potential future activities. Estimated savings are based on measures that have actually been implemented. If savings are shown to persist in future years, it is because the measure is permanent, such as an ordinance, or the savings are assumed to continue for the reason listed under the itemized activity. Estimated savings from water rate increases are the one exception to these conditions.

Water Rate Increases

Savings from water rate increases were included because entities such as the U.S. Environmental Protection Agency and others indicate specific savings for utilities that raise rates (Texas Water Development Board, 2013; U.S. E.P.A., 1998; Whitcomb, 1999). This project includes surveys of several utilities that have minimal education efforts, perform no other substantive conservation activities, and yet experienced significant demand reduction that coincided with rate increases. In those cases, savings estimates matched up closely with decreases in total GPCD. For many smaller utilities, especially those with customers lacking disposable income, this measure is the only tool used to conserve other than water loss reduction

The following assumptions were made for water rate increases:

- The model assumes that savings persist into future years because it is expected that the utility will continue to make periodic rate increases in line with the percentage increases from previous years.
- Only the last two rate increases for a utility were quantified.
- Savings grow with demand because as new customers enter the service area, they are assumed to adhere to the same price elasticity model estimates.
- A weighted average for savings was used when rate increases differed between residential and industrial-commercial-institutional (ICI) customers based on the individual utility's customer class breakdown.
- When a utility raised rates using tiered rate conservation pricing, a 50/50 savings split was used when increases differed between base and volumetric rates.
    - The reasoning is that all customers must react to the base increase, yet the pricing signal is stronger when volumetric rate increases affect the higher usage customers.
    - The 50/50 split is reasonable because many customers will not reach the higher volumetric tiers.
    - Studies show that most customers do not actually know they have reached the higher volumetric tiers; just that their bill has increased (Texas Water Development Board, 2013).

4.1 Itemized Activities

1. **Utility Website**
    a. Easy-to-use website with conservation tips and water rates
    b. Features contact information for Public Works staff and customer service

2. **Continuing Public Education**
    a. The utility engages the public in many ways including:
        i. Brochures, bill messages, displays, and exhibits

3. **Water Loss Reduction Savings**[15]
    a. Savings of 28 MG annually in 2015
    b. Water loss reduction savings = the difference between a utility's baseline[16] water loss GPCD submitted in its most recent 5-year water conservation plan and its most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB
    c. If water loss GPCD has increased from the utility's baseline or historic 5-year average to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount.
    d. All savings estimates grow each year at the same rate population figures for the utility grow in the regional water plan.

[15] If current water loss levels exceed a utility's baseline, this value is treated as a deduction from total quantified savings.
[16] In the absence of having a baseline figure provided in the utility's most recently submitted 5-year water conservation plan, the historic 5-year average for water loss GPCD in the plan was used.

5 Summary of Savings

Table 5-1. Savings from Water Loss Reduction (MG).

Year	Utility Population	Water Loss GPCD	Total Savings from Water Loss Reduction
Baseline	-	7.00	0
2015	76,538	6.00	28
2016	79,074	6.00	29
2017	81,611	6.00	30
2018	84,147	6.00	31
2019	86,684	6.00	32
2020	89,220	6.00	33
2021	91,377	6.00	33
2022	93,533	6.00	34
2023	95,690	6.00	35
2024	97,846	6.00	36

6 Suggested Activities

Up to four activities were chosen as potential suggested activities for individual reports. These activities are: AMI system with customer portal, twice-per-week (or less) outdoor watering ordinances, strategic water rate increases, and rain barrels.

Activities were chosen because they are:

- Achievable
- Prevalence of vendors that can actually implement them
- Acceptability to city councils, MUD boards, et al.
- Easily adopted
- Cost effective
- Yield high savings relative to cost

AMI systems with customer engagement portals were also chosen because they represent a profusion of future applications that will undoubtedly continue to advance conservation efforts. AMI and meter data management (MDM) companies are developing new and innovative ways to benefit water providers, customers, and ultimately states that are pushing conservation and usage analytics further.

Each utility should be cognizant of the potential impact that these suggested activities may have on its own unique rate and revenue situation.

Benefits to consider:

- Avoided water supply and wastewater costs
    - The higher water purchase, transmission, and distribution costs are, the greater the potential benefit realized when large amounts of water are conserved with these activities.

- Avoided system expansion costs
    - Conserving water may allow a utility to postpone building new system capacity by decreasing demand even as population grows.

Costs to consider:

- Staff time and resources
- Unit cost per unit saved
- Implementation costs
- Stakeholder agreement and support
- Other overhead and budget considerations

6.1 Suggested Activities with Savings Estimates

1. Advanced Metering Infrastructure with Customer Engagement Portal

These portals, along with mobile applications and billing statements, can provide customers with much more access to their water use data in simple and compelling formats. This access and comparison with other customers' usage can reduce water use through changed behavior, as well as provide an opportunity for other conservation programs to be offered to the customer for increased adoption and additional savings. AMI systems support leak notification and web portals with real-time data. Any water loss reduction savings that these systems also yield were included in the water loss assessment of individual reports for this project.

a. Specific utility results will vary based on portal features and frequency of customer notifications

b. Potential savings estimate assumes 20% of residential customers will use and save water due to the portal (Westin Engineering, 2015)

c. Estimate assumes customers will save 10% of total annual use due to the portal

  i. Savings estimate of 10% is an average of results from multiple studies (Chesnutt and Mitchell, 2013; East Bay Municipal Utility District, 2014; IBM, 2011; Texas A&M and Texas Water Resources Institute, 2016; Westin Engineering, 2015)

d. Residential customers' use assumed to make up approximately 67% of all retail customers' use based on utility profile information submitted to the TWDB

  i. This was the most common percentage of residential use among participating utilities in this project.

  ii. Actual customer class demand percentages will vary by utility.

e. 20% of residential customers saving 10% with this customer class breakdown amounts to 1.34% of total demand

f. Savings are assumed to increase along with demand as connections increase each year[17]

[17] The 10% consumption reduction figure for 20% of residential customers is conservative, but savings could be greater when monitored yearly as customer engagement increases.

g. See Table 6-1 for potential savings from this measure compared with the utility's WMS supply volumes targets.

Table 6-1. Current Savings + Potential Savings from AMI with Customer Portal (MG).

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Potential Savings from AMI with Customer Portal	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)
2016	0	29	29	40	0	0	0	69
2017	0	30	30	41	0	0	0	70
2018	0	31	31	42	0	0	0	72
2019	0	32	32	42	0	0	0	74
2020	0	33	33	43	0	0	0	76
2021	0	33	33	44	0	0	0	78
2022	0	34	34	45	0	0	0	79
2023	0	35	35	46	0	0	0	81
2024	0	36	36	47	0	0	0	83
2025	0	37	37	48	0	0	0	84
2026	0	37	37	49	0	0	0	86
2027	0	38	38	49	0	0	0	88
2028	0	39	39	50	0	0	0	89
2029	0	40	40	51	0	0	0	91
2030	0	40	40	52	0	0	0	93
2031	0	41	41	53	5	0	5	89
2032	0	42	42	54	11	0	11	85
2033	0	43	43	55	16	0	16	81
2034	0	44	44	56	22	0	22	78
2035	0	44	44	57	27	0	27	74
2036	0	45	45	58	33	0	33	70
2037	0	46	46	58	38	0	38	66
2038	0	47	47	59	44	0	44	63
2039	0	48	48	60	49	0	49	59
2040	0	48	48	61	54	0	54	55

2. Rain Barrels

a. In Region M, utilities could save approximately 13.1 gallons per year per gallon of capacity rebated, sold, or distributed (GDS Associates, 2002).

b. Estimated 10-year useful life for most barrels

Statewide Water Conservation Quantification Project
City of San Juan Report • 2017

1 Introduction

In Texas' 2017 State Water Plan, municipal water conservation is projected to meet 9.6 percent[1] of the state's future water needs by 2070. According to the 16 regional water plans that comprise the state water plan, this is expected to be achieved through a variety of measures such as installation of water efficient plumbing fixtures, water conservation pricing structures, water system audits, landscape irrigation ordinances, as well as other water conservation activities. The 9.6 percent is "in addition to the estimated share of future passive conservation savings from plumbing codes and water efficiency standards, which are embedded in municipal water demand projections" (Texas Water Development Board, 2017).

In 2015, the Texas Legislature appropriated funds to the Texas Water Development Board (TWDB) to fund a research project principally charged with quantitatively determining the savings of municipal water conservation activities being implemented in relation to the recommended conservation goals (supply volumes) in the State Water Plan. As part of the project, individual reports were completed for all participating utilities.

With this report, utilities will benefit by receiving a clear and concise picture of its water conservation goals alongside estimated savings from quantifiable activities. In the event that current activity savings may not be able to reach long-term goals, this report offers suggestions on how utilities can reach water conservation goals with activities that are effective, easily adopted, have widespread appeal, and are quantifiable.

2 Municipal Conservation Terminology and Review of Methodology Used by Regional Planners

To make use of the results of this study, it is important to understand several key terms used in the water planning process.

What is a water user group?

In this report, a water user group (WUG) refers to a retail water provider in the form a city, municipal utility district, water control and improvement district, special utility district, water supply corporation, fresh water supply district, or other type of water utility. The TWDB further defines WUGs as one of the following (Texas Water Development Board, 2016b):

- Cities and towns with a population of 500 or more
- Non-city utilities providing more than 280 acre-feet per year per year of water for municipal use
- Collective reporting units (CRUs) consisting of grouped utilities having a common association

[1] Equal to 811,224 acre-feet per year in conservation savings.

- County-Wide WUGs:
    - County-Other (Rural/unincorporated areas of municipal water use)
    - Manufacturing
    - Steam electric power generation

What is a recommended water management strategy?

A recommended water management strategy (WMS) is a measure that will help ensure WUGs have adequate water supplies for their end users well into the future. WMS examples include river diversions, groundwater use, reservoir and aquifer development, and irrigation conservation. When WMS is referred to in this report, it refers only to municipal conservation, which may include water loss reduction as a part of the same strategy.

What is a WMS supply volume?

A WMS supply volume is the amount of water that a given strategy is expected to yield each decade in the planning period if carried out by the WUG. In this report, a WMS supply volume is the amount of water recommended to come from municipal water conservation.

Some regional water plans separate this strategy's supply volume into a volume for municipal water conservation and a volume for water loss reduction for each decade. The total strategy supply volume is the sum of both. A regional water plan may also refer to "advanced conservation" as part of this strategy. Advanced conservation usually indicates that the volume could be achieved through a more robust mix of conservation activities described in the plan.

2.1 Regional Planning Group Approach to Determining Supply Volumes

Each regional water planning group (RWPG) is responsible for producing its own individual plan that, if executed, will provide sufficient water to its WUGs throughout a 50-year planning period. These plans are completed in five-year cycles, with the most recent edition being completed in 2016. The 2016 regional plans make up the 2017 State Water Plan, which sets out WMS supply volumes for the years 2020 through 2070.

The decadal WMS supply volumes for municipal conservation were established by each of the RWPGs in much the same manner. The RWPGs generally followed the guidelines of the Texas Legislature's Water Conservation Implementation Task Force on the pace utilities should target to reduce gallons per capita per day (GPCD)[2] consumption levels.

The targeted reductions used by most regions follow this formula:

- For municipal WUGs with water use of 140 GPCD and greater, the goal is to reduce per capita water use by one percent per year until the level of 140 GPCD is reached,

[2] Regional water planning GPCD is defined as the annual volume of water pumped, diverted, or purchased minus the volume exported (sold) to other water systems or large industrial facilities divided by the permanent resident population of the Municipal Water User Group in the regional water planning process divided by 365. Saline and reused/recycled water are not included in this volume (Texas Water Development Board, 2012).

> after which, the goal is to reduce per capita water use by one-fourth percent per year for the remainder of the planning period (Texas Water Development Board, 2016j).

The yearly reductions in GPCD for a given WUG are then converted into recommended supply volumes in acre-feet per year for each decade as the reductions in consumption continue. Some regions reduce GPCD by slightly different percentages before and after the 140 GPCD threshold, some do not apply further reductions in GPCD for WUGs once they reach 140 GPCD, while others recommend only "advanced conservation" activities once WUGs meet 140 GPCD.

2.2 Methodology

In order to complete a uniform quantification process, the first engagement was with utilities that agreed to participate and collected as much relevant data as possible. These data included, among many others, historical GPCD consumption figures, advanced metering infrastructure (AMI) specifications, and detailed feedback on each conservation activity being implemented. Personal interviews focused on determining when and to what extent these activities were being employed, as well as assessing plans to continue such conservation. Examples of frequently implemented activities include tiered water rate conservation pricing, strategic water rate increases, outdoor irrigation audits and ordinances, and rain barrel distribution.

Subsequently, each utility's conservation activities were quantified through several different means, including evidence-based studies, utility field results and savings determinations, manufacturer guarantees, water loss audits, TWDB studies, and other information that assigned a savings value to the activity's implementation.

Every conservation activity studied and quantified has a gallons-per-year estimate, useful life, and decay rate (if applicable) associated with it. Some activities' savings are projected to grow as demand grows over time, while some savings are constant each year and subside once useful life has run its course. For expanded methodology and details on studies and formulas used to determine activity savings, refer to Section 6 of the State Report included as part of this document.

Once analyzed, the resulting savings estimates from each utility were compared with the recommended WMS supply volumes in its respective regional plan to determine if the savings met, exceeded, or fell short of those volumes. Individual utility savings were aggregated to compare with regional volumes, and regional savings were aggregated to compare with state volumes.

It is important to note that this report quantified activity savings—not including water loss reduction—for the WMS supply volume comparison dating back to 2012. The reason for this is, with a few exceptions, the regional planners used 2011 as the base year for establishing potential WMS supply volumes.[3] In addition, any conservation savings achieved through 2011 are assumed to be accounted for in the regional water planning GPCD for that year.[4] Thus, quantifying from 2012 and forward is the most accurate way to determine if utilities are meeting

[3] Confirmed via personal communication with Region C, H, K, and L Plan consultants.
[4] It was established with TWDB planning staff that 2011 GPCD levels were chosen because they represented the most current water use and conservation patterns at the time.

the recommended conservation volumes in the regional plans. This assumption is by no means 100 percent accurate, however. Some previously implemented activities' savings persist into future years beyond this starting point, while some activities' savings have ceased. One year's GPCD will not necessarily include all savings yielded by conservation activities that came before it, but the quantification assessment must have a starting point.

2.3 Quantifiable Savings

The key to the project being useful and reliable is that the results from year to year are measurable. Quantifying conservation activities that can be accurately measured provides greater certainty and better planning for all stakeholders.

While many utilities are engaged in a variety of conservation activities, not all can currently be properly measured. Some examples of these activities include education initiatives, website and social media engagement, and enforcement for water waste. That does not mean these measures are not essential. Education of consumers, for example, is a fundamental activity that makes all others effective, but little hard data exists to quantify the results of education alone.

In addition, the work of conservation coordinators can have a particularly significant effect on the savings of all other activities, but the specific savings attributed to that staff role is difficult to quantify.

3 Results

This report compares San Juan's current water conservation activities and their quantified savings to two metrics: 1) Region M Water Plan's (Texas Water Development Board, 2016k) recommended WMS supply volumes for municipal conservation, and 2) San Juan's own 5- and 10-year goals as established in its most recent water conservation plan submitted to the TWDB.

The WMS supply volumes for municipal water conservation are laid out by decade (2020 – 2070) in the regional water plans to serve as benchmarks for what each utility could achieve via that strategy during a 50-year planning period.[5]

The 5- and 10-year goals in San Juan's most recent water conservation plan are established by the utility as realistic targets for reducing consumption over that timeframe. These reductions[6] are expressed in decreasing total GPCD[7] consumption and water loss GPCD.[8] [9]

The estimated savings in Tables 3-1 through 3-3 indicate the best information available as

[5] Some regional water plans separate this strategy volume into a volume for water conservation and a volume for water loss reduction for each decade. The total strategy volume is the sum of both.

[6] Occasionally, some utilities expect consumption to increase due to various reasons, such as an incoming industrial presence expected to raise consumption figures for the entire service area.

[7] As defined in TWDB water conservation plan annual report (Texas Water Development Board, 2016o): (Total Gallons in System ÷ Permanent Population) ÷ 365

[8] These plans also have targets for residential GPCD and water loss as a percentage (rather than GPCD), but this report does not address those goals.

[9] As defined in TWDB water conservation plan annual report (Texas Water Development Board, 2016o): (Total Water Loss ÷ Permanent Population) ÷ 365

provided by utility staff. Some ongoing activities may not be known and are within a utility's service area are implemented on a micro-scale that may not be quantified. Individual households and businesses may be implementing conservation measures that are unknown and therefore cannot be included in the report.

Explanation of approach to assessing water loss reduction savings

Water loss reduction savings are defined as the volume of water participating utilities are realizing from their water loss mitigation efforts. For this report, this value is the difference between each individual utility's baseline[10] for water loss GPCD and its most recent water loss GPCD reported in 2015 water loss audits on file with TWDB. Savings from all water loss reduction efforts—including pipe replacements and leak repair—are assumed to be included in this comparison to a utility's baseline.

Note that because a single year (2015) value was used for comparison, it is possible that the 2015 value could be anomalous due to a number of events that may have occurred that year, such as a water main break, a particularly wet year, or a robust effort by the utility to curtail water loss. This will distort future savings figures that were carried forward in the study because water loss will inevitably increase or decrease in later years.

Ideally, using a rolling five-year average in the calculation would correct such anomalies. However, there was insufficient data to do that for every utility. The approach was to use the most complete water loss data possible, which was represented by the 2015 water loss audit. This problem will be further minimized, as continued data collection will allow five-year averages to be calculated for a majority of utilities.

In this way, water loss savings estimates are different from all other activity savings estimates in the project. Whether savings were positive or negative depended on where individual utilities established their own baselines or where their five-year average started, and what water loss GPCD value was reported in 2015.

3.1 Current Savings Compared to Conservation WMS Supply Volume (in million gallons) in Regional Water Plan

Table 3-1 shows the 2070 outlook for San Juan with the utility's yearly recommended WMS supply volume in million gallons (MG) alongside its water savings from implemented activities, including from water loss reduction. These activities and their associated savings are covered in greater detail in Sections 4 and 5.

Starting in 2015, this table compares all quantified conservation activity and the recommended conservation WMS supply volume for the planning period. The following definitions pair with the column headers in Table 3-1.

<u>Actual Current Conservation Activity Savings</u> – All quantified activities currently being performed by the utility, *excluding* savings from water loss reduction. The regional planners used

[10] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.

2011 GPCD as the baseline for determining future conservation WMS supply volumes, therefore the study quantifies utility savings starting in 2012 for this comparison. The summary of these savings can be referenced in Table 5-1

Actual Water Loss Reduction Savings (as of 2015) – The difference between the baseline[11] for water loss GPCD and most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB. [12] The summary of these savings can be referenced in Table 5-2.

Total Savings from All Conservation Activity – Actual Current Conservation Activity Savings plus Actual Water Loss Reduction Savings (as of 2015).

Conservation WMS Volume – The recommended municipal water conservation supply volume in the regional plan for the decades ranging from 2020 to 2070. These volumes are converted to MG from the values listed in the plan in acre-feet and then calculated in annual increments.

Water Loss Reduction WMS Volume – Some regional water plans have a separate WMS volume for water conservation and for water loss reduction for each decade. If a WUG's regional plan has a WMS volume for water loss reduction, this column will have values other than zero.

Total Yearly WMS Volume – The sum of the Conservation WMS Volume and Water Loss Reduction WMS Volume.

Over (Short) – The amount that the utility's Total Savings from All Conservation Activity (since 2012), is over or below the Total Yearly WMS Volume in the regional water plan. If the amount falls below the WMS volume, it will appear in parentheses.

[11] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.
[12] If water loss GPCD has increased from the utility's baseline or historic five-year average to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount.

Table 3-1. Current Savings Compared to Conservation WMS Supply Volume (MG) in Regional Water Plan.

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)
2015	17.9	(95)	(77)	0	0	0	(77)
2016	18.4	(98)	(79)	0	0	0	(79)
2017	18.8	(101)	(82)	0	0	0	(82)

2062	38.6	(221)	(183)	507	0	507	(689)
2063	39.0	(224)	(185)	530	0	530	(715)
2064	39.5	(226)	(187)	553	0	553	(740)
2065	39.9	(229)	(189)	577	0	577	(766)
2066	40.4	(232)	(191)	600	0	600	(791)
2067	40.8	(234)	(193)	623	0	623	(817)
2068	41.3	(237)	(196)	647	0	647	(842)
2069	41.7	(239)	(198)	670	0	670	(868)
2070	42.2	(242)	(200)	694	0	694	(893)

3.2 Utility Water Conservation Plan Goals – Total GPCD

Table 3-2 shows how San Juan's quantified savings from its implemented activities compare with 5- and 10-year goals established in its individual water conservation plan submitted to the TWDB. The following definitions pair with the column headers in Table 3-2.

Utility Population – Estimated utility service area population for the years indicated.

Total GPCD Goals – Total GPCD goals start with the utility's baseline[13] for total GPCD and progress in subsequent years to match 5- and 10-year goals indicated in a utility's five-year water conservation plan on file with the TWDB. The first five annual GPCD goals were developed by spreading the difference between the baseline and five-year goal evenly over five years. The second five annual GPCD goals spread the difference between the five-year goal and 10-year goal evenly over the next five years.

Annual Savings Goal with Reduction in GPCD (MG) – This column shows what reductions from the baseline GPCD would yield in terms of volume each year as more water is saved. The volumes indicated here are what target GPCD goals look like expressed in million gallons. Annual volumes were derived using the formula: (baseline total GPCD – target total GPCD for that year) x 365 days ÷ 1,000,000 gallons.

Total Savings for All Current Quantified Activities (MG) – Total quantified savings for all current conservation activities and savings from water loss reduction. Refer to Tables 5-1 and 5-2 for details on these savings.

Over (Short) – The amount that the utility's total quantified savings for all current conservation activities (since 2012), including water loss reduction, is over or below the volume represented by reductions in GPCD each year. If the quantified savings are less than these target volumes, the value will appear in parentheses.

Table 3-2. Utility Water Conservation Plan Goals — Total GPCD.

Year #	Year	Utility Population	Total GPCD Goals	Annual Savings Goal with Reduction in GPCD (MG)	Total Savings for All Current Quantified Activities (MG)	Over (Short) (MG)
0	**Baseline**	-	82	0	0	0
1	2015	37,000	81	8	(77)	(85)
2	2016	38,181	81	17	(79)	(96)
3	2017	39,362	80	26	(82)	(108)
4	2018	40,544	80	36	(84)	(120)
5-year Goal	2019	41,725	79	46	(87)	(133)
6	2020	42,906	78	60	(90)	(149)
7	2021	43,943	77	74	(92)	(166)
8	2022	44,980	77	89	(94)	(183)
9	2023	46,017	76	104	(96)	(200)
10-year Goal	2024	47,054	75	120	(98)	(219)

[13] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for total GPCD from the utility's most recently submitted five-year water conservation plan was used.

3.3 Utility Water Conservation Plan Goals – Water Loss GPCD

Table 3-3 shows how San Juan's most recent water loss audit compares with five- and 10-year water loss goals in its water conservation plan. The following definitions pair with the column headers in Table 3-2.

Utility Population – Estimated utility service area population for the years indicated.

Water Loss GPCD Goals – Water loss GPCD goals start with the utility's baseline[14] for water loss GPCD and progress in subsequent years to match 5- and 10-year water loss goals indicated in a utility's five-year water conservation plan on file with the TWDB. The first five annual GPCD goals were developed by spreading the difference between the baseline and five-year goal evenly over five years. The second five annual GPCD goals spread the difference between the five-year goal and 10-year goal evenly over the next five years.

Yearly Savings Goal with Reduction in GPCD (MG) – This column shows what reductions from the baseline water loss GPCD would yield in terms of volume each year as more water is saved. The volumes indicated here are what target water loss GPCD goals look like expressed in million gallons. Annual volumes were derived using the formula: (baseline water loss GPCD – target water loss GPCD for that year) x 365 days ÷ 1,000,000 gallons.

Total Savings from Water Loss Reduction (MG) – The difference between a utility's established baseline for water loss GPCD and the most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB. If water loss GPCD has increased from the utility's baseline to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount. Reference Table 5-2 for savings from water loss reduction.

Over (Short) – The amount that the utility's total savings from water loss reduction is over or below the volume represented by reductions in GPCD each year. If water loss reduction savings are less than these target volumes, the value will appear in parentheses.

Table 3-3. Utility Water Conservation Plan Goals — Water Loss GPCD.

Year #	Year	Utility Population	Water Loss GPCD Goals	Yearly Savings Goal with Reduction in GPCD (MG)	Total Savings from Water Loss Reduction (MG)	Over (Short) (MG)
0	**Baseline**	-	14	0	0	0
1	2015	37,000	12	26	(95)	(121)
2	2016	38,181	10.1	55	(98)	(152)
3	2017	39,362	8.1	84	(101)	(185)
4	2018	40,544	6.2	116	(104)	(220)
5-year Goal	2019	41,725	4.2	149	(107)	(256)
6	2020	42,906	4.2	153	(110)	(263)
7	2021	43,943	4.2	157	(112)	(269)
8	2022	44,980	4.2	161	(115)	(276)
9	2023	46,017	4.2	165	(118)	(282)
10-year Goal	2024	47,054	4.2	168	(120)	(289)

[14] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.

4 Implemented Activities

Below is a list of completed activities with estimated water savings. Note that drought response and other measures are not included in the utility's water savings because they are temporary, awareness-based or not able to be accurately quantified on an annual basis.

These are not savings projections of potential future activities. Estimated savings are based on measures that have actually been implemented. If savings are shown to persist in future years, it is because the measure is permanent, such as an ordinance, or the savings are assumed to continue for the reason listed under the itemized activity. Estimated savings from water rate increases are the one exception to these conditions.

Water Rate Increases

Savings from water rate increases were included because entities such as the U.S. Environmental Protection Agency and others indicate specific savings for utilities that raise rates (Texas Water Development Board, 2013; U.S. E.P.A., 1998; Whitcomb, 1999). This project includes surveys of several utilities that have minimal education efforts, perform no other substantive conservation activities, and yet experienced significant demand reduction that coincided with rate increases. In those cases, savings estimates matched up closely with decreases in total GPCD. For many smaller utilities, especially those with customers lacking disposable income, this measure is the only tool used to conserve other than water loss reduction.

The following assumptions were made for water rate increases:

- The model assumes that savings persist into future years because it is expected that the utility will continue to make periodic rate increases in line with the percentage increases from previous years.
- Only the last two rate increases for a utility were quantified.
- Savings grow with demand because as new customers enter the service area, they are assumed to adhere to the same price elasticity model estimates.
- A weighted average for savings was used when rate increases differed between residential and industrial-commercial-institutional (ICI) customers based on the individual utility's customer class breakdown.
- When a utility raised rates using tiered rate conservation pricing, a 50/50 savings split was used when increases differed between base and volumetric rates.
    - The reasoning is that all customers must react to the base increase, yet the pricing signal is stronger when volumetric rate increases affect the higher usage customers.
    - The 50/50 split is reasonable because many customers will not reach the higher volumetric tiers.
    - Studies show that most customers do not actually know they have reached the higher volumetric tiers; just that their bill has increased (Texas Water Development Board, 2013).

4.1 Itemized Activities

1. **Utility Website**
    a. Easy-to-use website with conservation tips and water rates
    b. Features contact information for Public Works staff and customer service

2. **Continuing Public Education**
    a. The utility engages the public in many ways including:
        i. Brochures, bill messages, displays, and exhibits

3. **Water Loss Reduction Savings**[15]
    a. Loss of 95 MG annually in 2015
    b. Water loss reduction savings = the difference between a utility's baseline[16] water loss GPCD submitted in its most recent 5-year water conservation plan and its most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB
    c. If water loss GPCD has increased from the utility's baseline or historic 5-year average to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount.
    d. All savings estimates grow each year at the same rate population figures for the utility grow in the regional water plan.

4. **Conservation Pricing**
    a. Tiered rate structure in place saves approximately 2.5% of total demand
    b. Savings is cumulative and based on more than one source[17] (U.S. EPA, 1998; TWDB, 2013)

[15] If current water loss levels exceed a utility's baseline, this value is treated as a deduction from total quantified savings.
[16] In the absence of having a baseline figure provided in the utility's most recently submitted 5-year water conservation plan, the historic 5-year average for water loss GPCD in the plan was used.
[17] The study estimates a 2% demand reduction with 10% increase in price on a targeted customer class. By applying a ratio, it is possible to determine the savings for lower or higher percentage increases..

5 Summary of Savings

Table 5-1. Savings by Water Conservation Activity (MG).

Year	Conservation Pricing	TOTAL SAVINGS
2009	15.4	15.4
2010	15.8	15.8
2011	16.3	16.3
2012	16.7	16.7

2021	43,943	21	(112)
2022	44,980	21	(115)
2023	46,017	21	(118)
2024	47,054	21	(120)

6 Suggested Activities

Up to four activities were chosen as potential suggested activities for individual reports. These activities are: AMI system with customer portal, twice-per-week (or less) outdoor watering ordinances, strategic water rate increases, and rain barrels.

Activities were chosen because they are:

- Achievable
- Prevalence of vendors that can actually implement them
- Acceptability to city councils, MUD boards, et al.
- Easily adopted
- Cost effective
- Yield high savings relative to cost

AMI systems with customer engagement portals were also chosen because they represent a profusion of future applications that will undoubtedly continue to advance conservation efforts. AMI and meter data management (MDM) companies are developing new and innovative ways to benefit water providers, customers, and ultimately states that are pushing conservation and usage analytics further.

Each utility should be cognizant of the potential impact that these suggested activities may have on its own unique rate and revenue situation.

Benefits to consider:

- Avoided water supply and wastewater costs
  - The higher water purchase, transmission, and distribution costs are, the greater the potential benefit realized when large amounts of water are conserved with these activities.
- Avoided system expansion costs
  - Conserving water may allow a utility to postpone building new system capacity by decreasing demand even as population grows.

Costs to consider:

- Staff time and resources
- Unit cost per unit saved
- Implementation costs
- Stakeholder agreement and support
- Other overhead and budget considerations

6.1 Suggested Activities with Savings Estimates

1. Twice-a-week Outdoor Watering Restriction Ordinance
    a. Potentially 5.05% savings of total demand (Hermitte and Mace, 2012; Sierra Club-Lone Star Chapter and National Wildlife Federation, 2015)
        i. Average Region M savings
        ii. Specific percentage of outdoor usage unknown for your utility at this time
    b. Savings could be 93 MG per year with current demand.
    c. See Table 6-1 for potential savings from this measure compared with the city's WMS supply volumes targets.

Table 6-1. Current Savings + Potential Savings from 2x per Week Watering Ordinance (MG).

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Potential Savings from Ordinance	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)
2016	18	(98)	(79)	93	0	0	0	14
2017	19	(101)	(82)	95	0	0	0	13

2036	27	(152)	(125)	136	66	0	66	(56)
2037	27	(155)	(127)	138	77	0	77	(66)
2038	28	(157)	(130)	140	87	0	87	(77)
2039	28	(160)	(132)	142	97	0	97	(87)
2040	29	(163)	(134)	145	108	0	108	(97)

2. Advanced Metering Infrastructure with Customer Engagement Portal

These portals, along with mobile applications and billing statements, can provide customers with much more access to their water use data in simple and compelling formats. This access and comparison with other customers' usage can reduce water use through changed behavior, as well as provide an opportunity for other conservation programs to be offered to the customer for increased adoption and additional savings. AMI systems support leak notification and web portals with real-time data. Any water loss reduction savings that these systems also yield were included in the water loss assessment of individual reports for this project.

- **a.** Specific utility results will vary based on portal features and frequency of customer notifications
- **b.** Potential savings estimate assumes 20% of residential customers will use and save water due to the portal (Westin Engineering, 2015)
- **c.** Estimate assumes customers will save 10% of total annual use due to the portal
    - i. Savings estimate of 10% is an average of results from multiple studies (Chesnutt and Mitchell, 2013; East Bay Municipal Utility District, 2014; IBM, 2011; Texas A&M and Texas Water Resources Institute, 2016; Westin Engineering, 2015)
- **d.** Residential customers' use assumed to make up approximately 67% of all retail customers' use based on utility profile information submitted to the TWDB
    - i. This was the most common percentage of residential use among participating utilities in this project.
    - ii. Actual customer class demand percentages will vary by utility.
- **e.** 20% of residential customers saving 10% with this customer class breakdown amounts to 1.34% of total demand
- **f.** Savings are assumed to increase along with demand as connections increase each year[18]
- **g.** See Table 6-2 for potential savings from this measure compared with the utility's WMS supply volumes targets.

[18] The 10% consumption reduction figure for 20% of residential customers is conservative, but savings could be greater when monitored yearly as customer engagement increases.

Table 6-2. Current Savings + Potential Savings from AMI with Customer Portal (MG).

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Potential Savings from AMI with Customer Portal	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)
2016	18	(98)	(79)	25	0	0	0	(55)
2017	19	(101)	(82)	25	0	0	0	(57)
2018	19	(104)	(84)	26	0	0	0	(59)

2022	21	(115)	(94)	28	1	0	1	(67)
2023	21	(118)	(96)	29	1	0	1	(69)
2024	22	(120)	(98)	29	2	0	2	(71)
2025	22	(123)	(101)	30	2	0	2	(73)
2026	23	(126)	(103)	30	3	0	3	(76)
2027	23	(128)	(105)	31	3	0	3	(78)
2028	23	(131)	(107)	31	4	0	4	(80)
2029	24	(133)	(110)	32	4	0	4	(82)
2030	24	(136)	(112)	33	5	0	5	(84)
2031	25	(139)	(114)	33	15	0	15	(96)
2032	25	(141)	(116)	34	25	0	25	(108)
2033	26	(144)	(119)	34	36	0	36	(120)
2034	26	(147)	(121)	35	46	0	46	(132)
2035	26	(149)	(123)	35	56	0	56	(144)
2036	27	(152)	(125)	36	66	0	66	(156)
2037	27	(155)	(127)	37	77	0	77	(168)
2038	28	(157)	(130)	37	87	0	87	(179)
2039	28	(160)	(132)	38	97	0	97	(191)
2040	29	(163)	(134)	38	108	0	108	(203)

3. Water Rate Increase
   a. For every 10% increase, estimated savings could be 2% of utility total demand.
   b. Approximately 37 MG of savings per year with current demand
   c. Savings is cumulative and based on more than one source[19] (U.S. EPA, 1998; Whitcomb, 1999)
   d. See Table 6-3 for potential savings from this measure compared with the utility's conservation goals.

[19] The study estimates a 2% demand reduction with 10% increase in price on a targeted customer class. By applying a ratio, it is possible to determine the savings for lower or higher percentage increases..

Table 6-3. Current Savings + Potential Savings from 10% Water Rate Increase (MG).

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Potential Savings from Water Rate Increase	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)
2016	18	(98)	(79)	37	0	0	0	(42)

2031	25	(139)	(114)	49	15	0	15	(80)
2032	25	(141)	(116)	50	25	0	25	(91)
2033	26	(144)	(119)	51	36	0	36	(103)
2034	26	(147)	(121)	52	46	0	46	(115)
2035	26	(149)	(123)	53	56	0	56	(126)
2036	27	(152)	(125)	54	66	0	66	(138)
2037	27	(155)	(127)	55	77	0	77	(150)
2038	28	(157)	(130)	56	87	0	87	(161)
2039	28	(160)	(132)	56	97	0	97	(173)
2040	29	(163)	(134)	57	108	0	108	(184)

4. Rain Barrels
   a. In Region M, utilities could save approximately 13.1 gallons per year per gallon of capacity rebated, sold, or distributed (GDS Associates, 2002).
   b. Estimated 10-year useful life for most barrels

Statewide Water Conservation Quantification Project
Sharyland WSC Report • 2017

1 Introduction

In Texas' 2017 State Water Plan, municipal water conservation is projected to meet 9.6 percent[1] of the state's future water needs by 2070. According to the 16 regional water plans that comprise the state water plan, this is expected to be achieved through a variety of measures such as installation of water efficient plumbing fixtures, water conservation pricing structures, water system audits, landscape irrigation ordinances, as well as other water conservation activities. The 9.6 percent is "in addition to the estimated share of future passive conservation savings from plumbing codes and water efficiency standards, which are embedded in municipal water demand projections" (Texas Water Development Board, 2017).

In 2015, the Texas Legislature appropriated funds to the Texas Water Development Board (TWDB) to fund a research project principally charged with quantitatively determining the savings of municipal water conservation activities being implemented in relation to the recommended conservation goals (supply volumes) in the State Water Plan. As part of the project, individual reports were to be completed for all participating utilities.

With this report, utilities will benefit by receiving a clear and concise picture of its water conservation goals alongside estimated savings from quantifiable activities. In the event that current activity savings may not be able to reach long-term goals, this report offers suggestions on how utilities can reach water conservation goals with activities that are effective, easily adopted, have widespread appeal, and are quantifiable.

2 Municipal Conservation Terminology and Review of Methodology Used by Regional Planners

To make use of the results of this study, it is important to understand several key terms used in the water planning process.

What is a water user group?

In this report, a water user group (WUG) refers to a retail water provider in the form a city, municipal utility district, water control and improvement district, special utility district, water supply corporation, fresh water supply district, or other type of water utility. The TWDB further defines WUGs as one of the following (Texas Water Development Board, 2016b):

- Cities and towns with a population of 500 or more
- Non-city utilities providing more than 280 acre-feet per year per year of water for municipal use
- Collective reporting units (CRUs) consisting of grouped utilities having a common association

[1] Equal to 811,224 acre-feet per year in conservation savings.

- County-Wide WUGs:
  - County-Other (Rural/unincorporated areas of municipal water use)
  - Manufacturing
  - Steam electric power generation

What is a recommended water management strategy?

A recommended water management strategy (WMS) is a measure that will help ensure WUGs have adequate water supplies for their end users well into the future. WMS examples include river diversions, groundwater use, reservoir and aquifer development, and irrigation conservation. When WMS is referred to in this report, it refers only to municipal conservation, which may include water loss reduction as a part of the same strategy.

What is a WMS supply volume?

A WMS supply volume is the amount of water that a given strategy is expected to yield each decade in the planning period if carried out by the WUG. In this report, a WMS supply volume is the amount of water recommended to come from municipal water conservation.

Some regional water plans separate this strategy's supply volume into a volume for municipal water conservation and a volume for water loss reduction for each decade. The total strategy supply volume is the sum of both. A regional water plan may also refer to "advanced conservation" as part of this strategy. Advanced conservation usually indicates that the volume could be achieved through a more robust mix of conservation activities described in the plan.

2.1 Regional Planning Group Approach to Determining Supply Volumes

Each regional water planning group (RWPG) is responsible for producing its own individual plan that, if executed, will provide sufficient water to its WUGs throughout a 50-year planning period. These plans are completed in five-year cycles, with the most recent edition being completed in 2016. The 2016 regional plans make up the 2017 State Water Plan, which sets out WMS supply volumes for the years 2020 through 2070.

The decadal WMS supply volumes for municipal conservation were established by each of the RWPGs in much the same manner. The RWPGs generally followed the guidelines of the Texas Legislature's Water Conservation Implementation Task Force on the pace utilities should target to reduce gallons per capita per day (GPCD)[2] consumption levels.

The targeted reductions used by most regions follow this formula:

- For municipal WUGs with water use of 140 GPCD and greater, the goal is to reduce per capita water use by one percent per year until the level of 140 GPCD is reached,

[2] Regional water planning GPCD is defined as the annual volume of water pumped, diverted, or purchased minus the volume exported (sold) to other water systems or large industrial facilities divided by the permanent resident population of the Municipal Water User Group in the regional water planning process divided by 365. Saline and reused/recycled water are not included in this volume (Texas Water Development Board, 2012).

after which, the goal is to reduce per capita water use by one-fourth percent per year for the remainder of the planning period (Texas Water Development Board, 2015j).

The yearly reductions in GPCD for a given WUG are then converted into recommended supply volumes in acre-feet per year for each decade as the reductions in consumption continue. Some regions reduce GPCD by slightly different percentages before and after the 140 GPCD threshold, some do not apply further reductions in GPCD for WUGs once they reach 140 GPCD, while others recommend only "advanced conservation" activities once WUGs meet 140 GPCD.

2.2 Methodology

In order to complete a uniform quantification process, the first engagement was with utilities that agreed to participate and collected as much relevant data as possible. These data included, among many others, historical GPCD consumption figures, advanced metering infrastructure (AMI) specifications, and detailed feedback on each conservation activity being implemented. Personal interviews focused on determining when and to what extent these activities were being employed, as well as assessing plans to continue such conservation. Examples of frequently implemented activities include tiered water rate conservation pricing, strategic water rate increases, outdoor irrigation audits and ordinances, and rain barrel distribution.

Subsequently, each utility's conservation activities were quantified through several different means, including evidence-based studies, utility field results and savings determinations, manufacturer guarantees, water loss audits, TWDB studies, and other information that assigned a savings value to the activity's implementation.

Every conservation activity studied and quantified has a gallons-per-year estimate, useful life, and decay rate (if applicable) associated with it. Some activities' savings are projected to grow as demand grows over time, while some savings are constant each year and subside once useful life has run its course. For expanded methodology and details on studies and formulas used to determine activity savings, refer to Section 6 of the State Report included as part of this document.

Once analyzed, the resulting savings estimates from each utility were compared with the recommended WMS supply volumes in its respective regional plan to determine if the savings met, exceeded, or fell short of those volumes. Individual utility savings were aggregated to compare with regional volumes, and regional savings were aggregated to compare with state volumes.

It is important to note that this report quantified activity savings—not including water loss reduction—for the WMS supply volume comparison dating back to 2012. The reason for this is, with a few exceptions, the regional planners used 2011 as the base year for establishing potential WMS supply volumes.[3] In addition, any conservation savings achieved through 2011 are assumed to be accounted for in the regional water planning GPCD for that year.[4] Thus, quantifying from 2012 and forward is the most accurate way to determine if utilities are meeting

[3] Confirmed via personal communication with Region C, H, K, and L Plan consultants.
[4] It was established with TWDB planning staff that 2011 GPCD levels were chosen because they represented the most current water use and conservation patterns at the time.

the recommended conservation volumes in the regional plans. This assumption is by no means 100 percent accurate, however. Some previously implemented activities' savings persist into future years beyond this starting point, while some activities' savings have ceased. One year's GPCD will not necessarily include all savings yielded by conservation activities that came before it, but the quantification assessment must have a starting point.

2.3 Quantifiable Savings

The key to the project being useful and reliable is that the results from year to year are measurable. Quantifying conservation activities that can be accurately measured provides greater certainty and better planning for all stakeholders.

While many utilities are engaged in a variety of conservation activities, not all can currently be properly measured. Some examples of these activities include education initiatives, website and social media engagement, and enforcement for water waste. That does not mean these measures are not essential. Education of consumers, for example, is a fundamental activity that makes all others effective, but little hard data exists to quantify the results of education alone.

In addition, the work of conservation coordinators can have a particularly significant effect on the savings of all other activities, but the specific savings attributed to that staff role is difficult to quantify.

3 Results

This report compares Sharyland WSC's current water conservation activities and their quantified savings to two metrics: 1) Region M Water Plan's (Texas Water Development Board, 2016k) recommended WMS supply volumes for municipal conservation, and 2) Sharyland WSC's own 5- and 10-year goals as established in its most recent water conservation plan submitted to the TWDB.

The WMS supply volumes for municipal water conservation are laid out by decade (2020 – 2070) in the regional water plans to serve as benchmarks for what each utility could achieve via that strategy during a 50-year planning period.[5]

The 5- and 10-year goals in Sharyland WSC's most recent water conservation plan are established by the utility as realistic targets for reducing consumption over that timeframe. These reductions[6] are expressed in decreasing total GPCD [7] consumption and water loss GPCD.[8] [9]

---

[5] Some regional water plans separate this strategy volume into a volume for water conservation and a volume for water loss reduction for each decade. The total strategy volume is the sum of both.

[6] Occasionally, some utilities expect consumption to increase due to various reasons, such as an incoming industrial presence expected to raise consumption figures for the entire service area.

[7] As defined in TWDB water conservation plan annual report (Texas Water Development Board, 2016o): (Total Gallons in System ÷ Permanent Population) ÷ 365

[8] These plans also have targets for residential GPCD and water loss as a percentage (rather than GPCD), but this report does not address those goals.

[9] As defined in TWDB water conservation plan annual report (Texas Water Development Board, 2016o): (Total Water Loss ÷ Permanent Population) ÷ 365

The estimated savings in Tables 3-1 through 3-3 indicate the best information available as provided by utility staff. Some ongoing activities may not be known and are within a utility's service area are implemented on a micro-scale that may not be quantified. Individual households and businesses may be implementing conservation measures that are unknown and therefore cannot be included in the report.

Explanation of approach to assessing water loss reduction savings

Water loss reduction savings are defined as the volume of water participating utilities are realizing from their water loss mitigation efforts. For this report, this value is the difference between each individual utility's baseline[10] for water loss GPCD and its most recent water loss GPCD reported in 2015 water loss audits on file with TWDB. Savings from all water loss reduction efforts—including pipe replacements and leak repair—are assumed to be included in this comparison to a utility's baseline.

Note that because a single year (2015) value was used for comparison, it is possible that the 2015 value could be anomalous due to a number of events that may have occurred that year, such as a water main break, a particularly wet year, or a robust effort by the utility to curtail water loss. This will distort future savings figures that were carried forward in the study because water loss will inevitably increase or decrease in later years.

Ideally, using a rolling five-year average in the calculation would correct such anomalies. However, there was insufficient data to do that for every utility. The approach was to use the most complete water loss data possible, which was represented by the 2015 water loss audit. This problem will be further minimized, as continued data collection will allow five-year averages to be calculated for a majority of utilities.

In this way, water loss savings estimates are different from all other activity savings estimates in the project. Whether savings were positive or negative depended on where individual utilities established their own baselines or where their five-year average started, and what water loss GPCD value was reported in 2015.

3.1 Current Savings Compared to Conservation WMS Supply Volume (in million gallons) in Regional Water Plan

Table 3-1 shows the 2070 outlook for Sharyland WSC with the utility's yearly recommended WMS supply volume in million gallons (MG) alongside its water savings from implemented activities, including from water loss reduction. These activities and their associated savings are covered in greater detail in Sections 4 and 5.

Starting in 2015, this table compares all quantified conservation activity and the recommended conservation WMS supply volume for the planning period. The following definitions pair with the column headers in Table 3-1.

<u>Actual Current Conservation Activity Savings</u> – All quantified activities currently being

[10] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.

performed by the utility, *excluding* savings from water loss reduction. The regional planners used 2011 GPCD as the baseline for determining future conservation WMS supply volumes, therefore the study quantifies utility savings starting in 2012 for this comparison. The summary of these savings can be referenced in Table 5-1.

Actual Water Loss Reduction Savings (as of 2015) – The difference between the baseline[11] for water loss GPCD and most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB. [12] The summary of these savings can be referenced in Table 5-2.

Total Savings from All Conservation Activity – Actual Current Conservation Activity Savings plus Actual Water Loss Reduction Savings (as of 2015).

Conservation WMS Volume – The recommended municipal water conservation supply volume in the regional plan for the decades ranging from 2020 to 2070. These volumes are converted to MG from the values listed in the plan in acre-feet and then calculated in annual increments.

Water Loss Reduction WMS Volume – Some regional water plans have a separate WMS volume for water conservation and for water loss reduction for each decade. If a WUG's regional plan has a WMS volume for water loss reduction, this column will have values other than zero.

Total Yearly WMS Volume – The sum of the Conservation WMS Volume and Water Loss Reduction WMS Volume.

Over (Short) – The amount that the utility's Total Savings from All Conservation Activity (since 2012), is over or below the Total Yearly WMS Volume in the regional water plan. If the amount falls below the WMS volume, it will appear in parentheses.

[11] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.
[12] If water loss GPCD has increased from the utility's baseline or historic five-year average to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount.

Table 3-1. Current Savings Compared to Conservation WMS Supply Volume (MG) in Regional Water Plan.

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)
2015	50	85	135	33	0	33	102
2016	51	86	137	42	0	42	95
2017	52	87	139	42	0	42	97

2070	117	145	262	1,357	0	1,357	(1,095)

3.2 Utility Water Conservation Plan Goals – Total GPCD

Table 3-2 shows how Sharyland WSC's quantified savings from its implemented activities compare with 5- and 10-year goals established in its individual water conservation plan submitted to the TWDB. The following definitions pair with the column headers in Table 3-2.

Utility Population – Estimated utility service area population for the years indicated.

Total GPCD Goals – Total GPCD goals start with the utility's baseline[13] for total GPCD and progress in subsequent years to match five- and 10-year goals indicated in a utility's five-year water conservation plan on file with the TWDB. The first five annual GPCD goals were developed by spreading the difference between the baseline and five-year goal evenly over five years. The second five annual GPCD goals spread the difference between the five-year goal and 10-year goal evenly over the next five years.

Annual Savings Goal with Reduction in GPCD (MG) – This column shows what reductions from the baseline GPCD would yield in terms of volume each year as more water is saved. The volumes indicated here are what target GPCD goals look like expressed in million gallons. Annual volumes were derived using the formula: (baseline total GPCD – target total GPCD for that year) x 365 days ÷ 1,000,000 gallons.

Total Savings for All Current Quantified Activities (MG) – Total quantified savings for all current conservation activities and savings from water loss reduction. Refer to Tables 5-1 and 5-2 for details on these savings.

Over (Short) – The amount that the utility's total quantified savings for all current conservation activities (since 2012), including water loss reduction, is over or below the volume represented by reductions in GPCD each year. If the quantified savings are less than these target volumes, the value will appear in parentheses.

Table 3-2. Utility Water Conservation Plan Goals — Total GPCD.

Year #	Year	Utility Population	Total GPCD Goals	Annual Savings Goal with Reduction in GPCD (MG)	Total Savings for All Current Quantified Activities (MG)	Over (Short) (MG)
0	**Baseline**	-	154	0	0	0
1	2015	58,500	153	30	135	105
2	2016	59,048	151	60	137	77
3	2017	59,596	150	91	139	48
4	2018	60,144	148	123	141	18
5-year Goal	2019	60,692	147	155	143	(12)
6	2020	61,240	146	183	145	(38)
7	2021	61,671	145	212	147	(65)
8	2022	62,101	143	240	148	(92)
9	2023	62,532	142	269	150	(119)
10-year Goal	2024	62,962	141	299	152	(147)

[13] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for total GPCD from the utility's most recently submitted five-year water conservation plan was used.

3.3 Utility Water Conservation Plan Goals – Water Loss GPCD

Table 3-3 shows how Sharyland WSC's most recent water loss audit compares with five- and 10-year water loss goals in its water conservation plan. The following definitions pair with the column headers in Table 3-2.

Utility Population – Estimated utility service area population for the years indicated.

Water Loss GPCD Goals – Water loss GPCD goals start with the utility's baseline[14] for water loss GPCD and progress in subsequent years to match 5- and 10-year water loss goals indicated in a utility's five-year water conservation plan on file with the TWDB. The first five annual GPCD goals were developed by spreading the difference between the baseline and five-year goal evenly over five years. The second five annual GPCD goals spread the difference between the five-year goal and 10-year goal evenly over the next five years.

Yearly Savings Goal with Reduction in GPCD (MG) – This column shows what reductions from the baseline water loss GPCD would yield in terms of volume each year as more water is saved. The volumes indicated here are what target water loss GPCD goals look like expressed in million gallons. Annual volumes were derived using the formula: (baseline water loss GPCD – target water loss GPCD for that year) x 365 days ÷ 1,000,000 gallons.

Total Savings from Water Loss Reduction (MG) – The difference between a utility's established baseline for water loss GPCD and the most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB. If water loss GPCD has increased from the utility's baseline to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount. Reference Table 5-2 for savings from water loss reduction.

Over (Short) – The amount that the utility's total savings from water loss reduction is over or below the volume represented by reductions in GPCD each year. If water loss reduction savings are less than these target volumes, the value will appear in parentheses.

Table 3-3. Utility Water Conservation Plan Goals — Water Loss GPCD.

Year #	Year	Utility Population	Water Loss GPCD Goals	Yearly Savings Goal with Reduction in GPCD (MG)	Total Savings from Water Loss Reduction (MG)	Over (Short) (MG)
0	**Baseline**	-	10.00	0	0	0
1	2015	58,500	10.00	0	85	85
2	2016	59,048	10.00	0	86	86
3	2017	59,596	10.00	0	87	87
4	2018	60,144	10.00	0	88	88
5-year Goal	2019	60,692	10.00	0	89	89
6	2020	61,240	9.00	22	89	67
7	2021	61,671	8.00	45	90	45
8	2022	62,101	7.00	68	91	23
9	2023	62,532	6.00	91	91	0
10-year Goal	2024	62,962	5.00	115	92	(23)

[14] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.

4 Implemented Activities

Below is a list of completed activities with estimated water savings. Note that drought response and other measures are not included in the utility's water savings because they are temporary, awareness-based or not able to be accurately quantified on an annual basis.

These are not savings projections of potential future activities. Estimated savings are based on measures that have actually been implemented. If savings are shown to persist in future years, it is because the measure is permanent, such as an ordinance, or the savings are assumed to continue for the reason listed under the itemized activity. Estimated savings from water rate increases are the one exception to these conditions.

Water Rate Increases

Savings from water rate increases were included because entities such as the U.S. Environmental Protection Agency and others indicate specific savings for utilities that raise rates (Texas Water Development Board, 2013; U.S. E.P.A., 1998; Whitcomb, 1999). This project includes surveys of several utilities that have minimal education efforts, perform no other substantive conservation activities, and yet experienced significant demand reduction that coincided with rate increases. In those cases, savings estimates matched up closely with decreases in total GPCD. For many smaller utilities, especially those with customers lacking disposable income, this measure is the only tool used to conserve other than water loss reduction.

The following assumptions were made for water rate increases:

- The model assumes that savings persist into future years because it is expected that the utility will continue to make periodic rate increases in line with the percentage increases from previous years.
- Only the last two rate increases for a utility were quantified.
- Savings grow with demand because as new customers enter the service area, they are assumed to adhere to the same price elasticity model estimates.
- A weighted average for savings was used when rate increases differed between residential and industrial-commercial-institutional (ICI) customers based on the individual utility's customer class breakdown.
- When a utility raised rates using tiered rate conservation pricing, a 50/50 savings split was used when increases differed between base and volumetric rates.
    - The reasoning is that all customers must react to the base increase, yet the pricing signal is stronger when volumetric rate increases affect the higher usage customers.
    - The 50/50 split is reasonable because many customers will not reach the higher volumetric tiers.
    - Studies show that most customers do not actually know they have reached the higher volumetric tiers; just that their bill has increased (Texas Water Development Board, 2013).

4.1 Itemized Activities

1. **Utility Website**
    a. Easy-to-use website with conservation tips and water rates
    b. Features contact information for Public Works staff and customer service

2. **Continuing Public Education**
    a. The utility engages the public in many ways including:
        i. Brochures, bill messages, displays, and exhibits

3. **Water Loss Reduction Savings**[15]
    a. Savings of 85 MG annually in 2015
    b. Water loss reduction savings = the difference between a utility's baseline[16] water loss GPCD submitted in its most recent 5-year water conservation plan and its most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB
    c. If water loss GPCD has increased from the utility's baseline or historic 5-year average to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount.
    d. All savings estimates grow each year at the same rate population figures for the utility grow in the regional water plan.

4. **Water Rate Increase**
    a. Last rate increase:[17]
        i. 10.6% increase in 2014
    b. Estimated customer demand reduction of 2.2%
    c. Savings is cumulative and based on more than one source[18] (U.S. EPA, 1998; Whitcomb, 1999)
    d. Savings from rate increases are shown to persist over time, however, note that savings from these pricing signals will likely decrease if rates remain the same in future years.

[15] If current water loss levels exceed a utility's baseline, this value is treated as a deduction from total quantified savings.
[16] In the absence of having a baseline figure provided in the utility's most recently submitted 5-year water conservation plan, the historic 5-year average for water loss GPCD in the plan was used.
[17] Correspondence with utility staff.
[18] The study estimates a 2% demand reduction with 10% increase in price on a targeted customer class. By applying a ratio, it is possible to determine the savings for lower or higher percentage increases.

5 Summary of Savings

Table 5-1. Savings by Water Conservation Activity (MG).

Year	Water Rate Increase	TOTAL SAVINGS
2009		0
2010		0
2011		0
2012		0
2013		0
2014	48.4	48
2015	49.6	50
2016	50.8	51
2017	51.9	52
2018	53.1	53
2019	54.3	54
2020	55.5	55
2021	56.6	57
2022	57.8	58
2023	59.0	59
2024	60.1	60
2025	61.3	61
2026	62.5	62
2027	63.7	64
2028	64.8	65
2029	66.0	66
2030	67.2	67
2031	68.4	68
2032	69.6	70
2033	70.8	71
2034	72.0	72
2035	73.2	73
2036	74.4	74
2037	75.6	76
2038	76.8	77
2039	78.0	78
2040	79.2	79
2041	80.4	80
2042	81.7	82
2043	82.9	83
2044	84.1	84
2045	85.4	85
2046	86.6	87
2047	87.8	88
2048	89.1	89
2049	90.3	90
2050	91.6	92
2051	92.8	93
2052	94.1	94
2053	95.4	95
2054	96.6	97
2055	97.9	98
2056	99.2	99
2057	100.5	100
2058	101.7	102
2059	103.0	103
2060	104.3	104
2061	105.5	106
2062	106.8	107
2063	108.0	108
2064	109.3	109
2065	110.5	111
2066	111.8	112
2067	113.0	113
2068	114.2	114
2069	115.5	115
2070	116.7	117

Table 5-2. Savings from Water Loss Reduction (MG).

Year	Utility Population	Water Loss GPCD	Total Savings from Water Loss Reduction
Baseline	-	10.00	0
2015	58,500	6.00	85
2016	59,048	6.00	86
2017	59,596	6.00	87
2018	60,144	6.00	88
2019	60,692	6.00	89
2020	61,240	6.00	89
2021	61,671	6.00	90
2022	62,101	6.00	91
2023	62,532	6.00	91
2024	62,962	6.00	92

6 Suggested Activities

Up to four activities were chosen as potential suggested activities for individual reports. These activities are: AMI system with customer portal, twice-per-week (or less) outdoor watering ordinances, strategic water rate increases, and rain barrels.

Activities were chosen because they are:

- Achievable
- Prevalence of vendors that can actually implement them
- Acceptability to city councils, MUD boards, et al.
- Easily adopted
- Cost effective
- Yield high savings relative to cost

AMI systems with customer engagement portals were also chosen because they represent a profusion of future applications that will undoubtedly continue to advance conservation efforts. AMI and meter data management (MDM) companies are developing new and innovative ways to benefit water providers, customers, and ultimately states that are pushing conservation and usage analytics further.

Each utility should be cognizant of the potential impact that these suggested activities may have on its own unique rate and revenue situation.

Benefits to consider:

- Avoided water supply and wastewater costs
    - o The higher water purchase, transmission, and distribution costs are, the greater the potential benefit realized when large amounts of water are conserved with these activities.
- Avoided system expansion costs
    - o Conserving water may allow a utility to postpone building new system capacity by decreasing demand even as population grows.

Costs to consider:

- Staff time and resources
- Unit cost per unit saved
- Implementation costs
- Stakeholder agreement and support
- Other overhead and budget considerations

6.1 Suggested Activities with Savings Estimates

1. Twice-a-week Outdoor Watering Restriction Ordinance
    a. Potentially 5.05% savings of total demand (Hermitte and Mace, 2012; Sierra Club-Lone Star Chapter and National Wildlife Federation, 2015)
        i. Average Region M savings
        ii. Specific percentage of outdoor usage unknown for your utility at this time
    b. Savings could be 121 MG per year with current demand.
    c. See Table 6-1 for potential savings from this measure compared with the city's WMS supply volumes targets.

Table 6-1. Current Savings + Potential Savings from 2x per Week Watering Ordinance (MG).

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Potential Savings from Ordinance	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)
2016	51	86	137	121	42	0	42	216
2017	52	87	139	124	42	0	42	221
2018	53	88	141	127	50	0	50	217
2019	54	89	143	129	59	0	59	214
2020	55	89	145	132	75	0	75	202
2021	57	90	147	135	99	0	99	182
2022	58	91	148	138	123	0	123	163
2023	59	91	150	140	147	0	147	143
2024	60	92	152	143	171	0	171	124
2025	61	93	154	146	195	0	195	105
2026	62	93	156	149	219	0	219	85
2027	64	94	157	152	243	0	243	66
2028	65	94	159	154	267	0	267	46
2029	66	95	161	157	291	0	291	27
2030	67	96	163	160	315	0	315	7
2031	68	96	165	163	333	0	333	(5)
2032	70	97	167	166	351	0	351	(18)
2033	71	98	168	169	368	0	368	(31)
2034	72	98	170	171	386	0	386	(44)
2035	73	99	172	174	403	0	403	(57)
2036	74	99	174	177	421	0	421	(70)
2037	76	100	176	180	438	0	438	(83)
2038	77	101	178	183	456	0	456	(96)
2039	78	101	179	186	474	0	474	(108)
2040	79	102	181	189	491	0	491	(121)

2. Advanced Metering Infrastructure with Customer Engagement Portal

These portals, along with mobile applications and billing statements, can provide customers with much more access to their water use data in simple and compelling formats. This access and comparison with other customers' usage can reduce water use through changed behavior, as well as provide an opportunity for other conservation programs to be offered to the customer for increased adoption and additional savings. AMI systems support leak notification and web portals with real-time data. Any water loss reduction savings that these systems also yield were included in the water loss assessment of individual reports for this project.

- **a.** Specific utility results will vary based on portal features and frequency of customer notifications
- **b.** Potential savings estimate assumes 20% of residential customers will use and save water due to the portal (Westin Engineering, 2015)
- **c.** Estimate assumes customers will save 10% of total annual use due to the portal
    - i. Savings estimate of 10% is an average of results from multiple studies (Chesnutt and Mitchell, 2013; East Bay Municipal Utility District, 2014; IBM, 2011; Texas A&M and Texas Water Resources Institute, 2016; Westin Engineering, 2015)
- **d.** Residential customers' use assumed to make up approximately 67% of all retail customers' use based on utility profile information submitted to the TWDB
    - i. This was the most common percentage of residential use among participating utilities in this project.
    - ii. Actual customer class demand percentages will vary by utility.
- **e.** 20% of residential customers saving 10% with this customer class breakdown amounts to 1.34% of total demand
- **f.** Savings are assumed to increase along with demand as connections increase each year[19]
- **g.** See Table 6-2 for potential savings from this measure compared with the utility's WMS supply volumes targets.

[19] The 10% consumption reduction figure for 20% of residential customers is conservative, but savings could be greater when monitored yearly as customer engagement increases.

Table 6-2. Current Savings + Potential Savings from AMI with Customer Portal (MG).

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Potential Savings from AMI with Customer Portal	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)
2016	51	86	137	32	42	0	42	127

3. Rain Barrels
   a. In Region M, utilities could save approximately 13.1 gallons per year per gallon of capacity rebated, sold, or distributed (GDS Associates, 2002).
   b. Estimated 10-year useful life for most barrels

Statewide Water Conservation Quantification Project
Union WSC Report • 2017

1 Introduction

In Texas' 2017 State Water Plan, municipal water conservation is projected to meet 9.6 percent[1] of the state's future water needs by 2070. According to the 16 regional water plans that comprise the state water plan, this is expected to be achieved through a variety of measures such as installation of water efficient plumbing fixtures, water conservation pricing structures, water system audits, landscape irrigation ordinances, as well as other water conservation activities. The 9.6 percent is "in addition to the estimated share of future passive conservation savings from plumbing codes and water efficiency standards, which are embedded in municipal water demand projections" (Texas Water Development Board, 2017).

In 2015, the Texas Legislature appropriated funds to the Texas Water Development Board (TWDB) to fund a research project principally charged with quantitatively determining the savings of municipal water conservation activities being implemented in relation to the recommended conservation goals (supply volumes) in the State Water Plan. As part of the project, individual reports were completed for all participating utilities.

With this report, utilities will benefit by receiving a clear and concise picture of its water conservation goals alongside estimated savings from quantifiable activities. In the event that current activity savings may not be able to reach long-term goals, this report offers suggestions on how utilities can reach water conservation goals with activities that are effective, easily adopted, have widespread appeal, and are quantifiable.

2 Municipal Conservation Terminology and Review of Methodology Used by Regional Planners

To make use of the results of this study, it is important to understand several key terms used in the water planning process.

What is a water user group?

In this report, a water user group (WUG) refers to a retail water provider in the form a city, municipal utility district, water control and improvement district, special utility district, water supply corporation, fresh water supply district, or other type of water utility. The TWDB further defines WUGs as one of the following (Texas Water Development Board, 2016b):

- Cities and towns with a population of 500 or more
- Non-city utilities providing more than 280 acre-feet per year per year of water for municipal use
- Collective reporting units (CRUs) consisting of grouped utilities having a common association

[1] Equal to 811,224 acre-feet per year in conservation savings.

- County-Wide WUGs:
    - County-Other (Rural/unincorporated areas of municipal water use)
    - Manufacturing
    - Steam electric power generation

What is a recommended water management strategy?

A recommended water management strategy (WMS) is a measure that will help ensure WUGs have adequate water supplies for their end users well into the future. WMS examples include river diversions, groundwater use, reservoir and aquifer development, and irrigation conservation. When WMS is referred to in this report, it refers only to municipal conservation, which may include water loss reduction as a part of the same strategy.

What is a WMS supply volume?

A WMS supply volume is the amount of water that a given strategy is expected to yield each decade in the planning period if carried out by the WUG. In this report, a WMS supply volume is the amount of water recommended to come from municipal water conservation.

Some regional water plans separate this strategy's supply volume into a volume for municipal water conservation and a volume for water loss reduction for each decade. The total strategy supply volume is the sum of both. A regional water plan may also refer to "advanced conservation" as part of this strategy. Advanced conservation usually indicates that the volume could be achieved through a more robust mix of conservation activities described in the plan.

2.1 Regional Planning Group Approach to Determining Supply Volumes

Each regional water planning group (RWPG) is responsible for producing its own individual plan that, if executed, will provide sufficient water to its WUGs throughout a 50-year planning period. These plans are completed in five-year cycles, with the most recent edition being completed in 2016. The 2016 regional plans make up the 2017 State Water Plan, which sets out WMS supply volumes for the years 2020 through 2070.

The decadal WMS supply volumes for municipal conservation were established by each of the RWPGs in much the same manner. The RWPGs generally followed the guidelines of the Texas Legislature's Water Conservation Implementation Task Force on the pace utilities should target to reduce gallons per capita per day (GPCD)[2] consumption levels.

The targeted reductions used by most regions follow this formula:

- For municipal WUGs with water use of 140 GPCD and greater, the goal is to reduce per capita water use by one percent per year until the level of 140 GPCD is reached,

[2] Regional water planning GPCD is defined as the annual volume of water pumped, diverted, or purchased minus the volume exported (sold) to other water systems or large industrial facilities divided by the permanent resident population of the Municipal Water User Group in the regional water planning process divided by 365. Saline and reused/recycled water are not included in this volume (Texas Water Development Board, 2012).

after which, the goal is to reduce per capita water use by one-fourth percent per year for the remainder of the planning period (Texas Water Development Board, 2016j).

The yearly reductions in GPCD for a given WUG are then converted into recommended supply volumes in acre-feet per year for each decade as the reductions in consumption continue. Some regions reduce GPCD by slightly different percentages before and after the 140 GPCD threshold, some do not apply further reductions in GPCD for WUGs once they reach 140 GPCD, while others recommend only "advanced conservation" activities once WUGs meet 140 GPCD.

2.2 Methodology

In order to complete a uniform quantification process, the first engagement was with utilities that agreed to participate and collected as much relevant data as possible. These data included, among many others, historical GPCD consumption figures, advanced metering infrastructure (AMI) specifications, and detailed feedback on each conservation activity being implemented. Personal interviews focused on determining when and to what extent these activities were being employed, as well as assessing plans to continue such conservation. Examples of frequently implemented activities include tiered water rate conservation pricing, strategic water rate increases, outdoor irrigation audits and ordinances, and rain barrel distribution.

Subsequently, each utility's conservation activities were quantified through several different means, including evidence-based studies, utility field results and savings determinations, manufacturer guarantees, water loss audits, TWDB studies, and other information that assigned a savings value to the activity's implementation.

Every conservation activity studied and quantified has a gallons-per-year estimate, useful life, and decay rate (if applicable) associated with it. Some activities' savings are projected to grow as demand grows over time, while some savings are constant each year and subside once useful life has run its course. For expanded methodology and details on studies and formulas used to determine activity savings, refer to Section 6 of the State Report included as part of this document.

It is important to note that this report quantified activity savings—not including water loss reduction—for the WMS supply volume comparison dating back to 2012. The reason for this is, with a few exceptions, the regional planners used 2011 as the base year for establishing potential WMS supply volumes.[3] In addition, any conservation savings achieved through 2011 are assumed to be accounted for in the regional water planning GPCD for that year.[4] Thus, quantifying from 2012 and forward is the most accurate way to determine if utilities are meeting the recommended conservation volumes in the regional plans. This assumption is by no means 100 percent accurate, however. Some previously implemented activities' savings persist into future years beyond this starting point, while some activities' savings have ceased. One year's GPCD will not necessarily include all savings yielded by conservation activities that came before it, but the quantification assessment must have a starting point.

[3] Confirmed via personal communication with Region C, H, K, and L Plan consultants.
[4] It was established with TWDB planning staff that 2011 GPCD levels were chosen because they represented the most current water use and conservation patterns at the time.

2.3 Quantifiable Savings

The key to the project being useful and reliable is that the results from year to year are measurable. Quantifying conservation activities that can be accurately measured provides greater certainty and better planning for all stakeholders.

While many utilities are engaged in a variety of conservation activities, not all can currently be properly measured. Some examples of these activities include education initiatives, website and social media engagement, and enforcement for water waste. That does not mean these measures are not essential. Education of consumers, for example, is a fundamental activity that makes all others effective, but little hard data exists to quantify the results of education alone.

In addition, the work of conservation coordinators can have a particularly significant effect on the savings of all other activities, but the specific savings attributed to that staff role is difficult to quantify.

3 Results

This report compares Union WSC's current water conservation activities and their quantified savings to two metrics: 1) Region M Water Plan's (Texas Water Development Board, 2016k) recommended WMS supply volumes for municipal conservation, and 2) Union WSC's own 5- and 10-year goals as established in its most recent water conservation plan submitted to the TWDB.

The WMS supply volumes for municipal water conservation are laid out by decade (2020 – 2070) in the regional water plans to serve as benchmarks for what each utility could achieve via that strategy during a 50-year planning period.[5]

The 5- and 10-year goals in Union WSC's most recent water conservation plan are established by the utility as realistic targets for reducing consumption over that timeframe. These reductions[6] are expressed in decreasing total GPCD[7] consumption and water loss GPCD.[8] [9]

The estimated savings in Tables 3-1 through 3-3 indicate the best information available as provided by utility staff. Some ongoing activities may not be known and are within a utility's service area are implemented on a micro-scale that may not be quantified. Individual households and businesses may be implementing conservation measures that are unknown and therefore cannot be included in the report.

---

[5] Some regional water plans separate this strategy volume into a volume for water conservation and a volume for water loss reduction for each decade. The total strategy volume is the sum of both.

[6] Occasionally, some utilities expect consumption to increase due to various reasons, such as an incoming industrial presence expected to raise consumption figures for the entire service area.

[7] As defined in TWDB water conservation plan annual report (Texas Water Development Board, 2016o): (Total Gallons in System ÷ Permanent Population) ÷ 365

[8] These plans also have targets for residential GPCD and water loss as a percentage (rather than GPCD), but this report does not address those goals.

[9] As defined in TWDB water conservation plan annual report (Texas Water Development Board, 2016o): (Total Water Loss ÷ Permanent Population) ÷ 365

Explanation of approach to assessing water loss reduction savings

Water loss reduction savings are defined as the volume of water participating utilities are realizing from their water loss mitigation efforts. For this report, this value is the difference between each individual utility's baseline[10] for water loss GPCD and its most recent water loss GPCD reported in 2015 water loss audits on file with TWDB. Savings from all water loss reduction efforts—including pipe replacements and leak repair—are assumed to be included in this comparison to a utility's baseline.

Note that because a single year (2015) value was used for comparison, it is possible that the 2015 value could be anomalous due to a number of events that may have occurred that year, such as a water main break, a particularly wet year, or a robust effort by the utility to curtail water loss. This will distort future savings figures that were carried forward in the study because water loss will inevitably increase or decrease in later years.

Ideally, using a rolling five-year average in the calculation would correct such anomalies. However, there was insufficient data to do that for every utility. The approach was to use the most complete water loss data possible, which was represented by the 2015 water loss audit. This problem will be further minimized, as continued data collection will allow five-year averages to be calculated for a majority of utilities.

In this way, water loss savings estimates are different from all other activity savings estimates in the project. Whether savings were positive or negative depended on where individual utilities established their own baselines or where their five-year average started, and what water loss GPCD value was reported in 2015.

3.1 Current Savings Compared to Conservation WMS Supply Volume (in million gallons) in Regional Water Plan

Table 3-1 shows the 2070 outlook for Union WSC with the utility's yearly recommended WMS supply volume in million gallons (MG) alongside its water savings from implemented activities, including from water loss reduction. These activities and their associated savings are covered in greater detail in Sections 4 and 5.

Starting in 2015, this table compares all quantified conservation activity and the recommended conservation WMS supply volume for the planning period. The following definitions pair with the column headers in Table 3-1.

<u>Actual Current Conservation Activity Savings</u> – All quantified activities currently being performed by the utility, *excluding* savings from water loss reduction. The regional planners used 2011 GPCD as the baseline for determining future conservation WMS supply volumes, therefore the study quantifies utility savings starting in 2012 for this comparison. The summary of these savings can be referenced in Table 5-1.

[10] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.

Actual Water Loss Reduction Savings (as of 2015) – The difference between the baseline[11] for water loss GPCD and most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB. [12] The summary of these savings can be referenced in Table 5-2.

Total Savings from All Conservation Activity – Actual Current Conservation Activity Savings plus Actual Water Loss Reduction Savings (as of 2015).

Conservation WMS Volume – The recommended municipal water conservation supply volume in the regional plan for the decades ranging from 2020 to 2070. These volumes are converted to MG from the values listed in the plan in acre-feet and then calculated in annual increments.

Water Loss Reduction WMS Volume – Some regional water plans have a separate WMS volume for water conservation and for water loss reduction for each decade. If a WUG's regional plan has a WMS volume for water loss reduction, this column will have values other than zero.

Total Yearly WMS Volume – The sum of the Conservation WMS Volume and Water Loss Reduction WMS Volume.

Over (Short) – The amount that the utility's Total Savings from All Conservation Activity (since 2012), is over or below the Total Yearly WMS Volume in the regional water plan. If the amount falls below the WMS volume, it will appear in parentheses.

[11] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.
[12] If water loss GPCD has increased from the utility's baseline or historic five-year average to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount.

Table 3-1. Current Savings Compared to Conservation WMS Supply Volume (MG) in Regional Water Plan.

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)

3.2 Utility Water Conservation Plan Goals – Total GPCD

Table 3-2 shows how Union WSC's quantified savings from its implemented activities compare with 5- and 10-year goals established in its individual water conservation plan submitted to the TWDB. The following definitions pair with the column headers in Table 3-2.

Utility Population – Estimated utility service area population for the years indicated.

Total GPCD Goals – Total GPCD goals start with the utility's baseline[13] for total GPCD and progress in subsequent years to match 5- and 10-year goals indicated in a utility's five-year water conservation plan on file with the TWDB. The first five annual GPCD goals were developed by spreading the difference between the baseline and five-year goal evenly over five years. The second five annual GPCD goals spread the difference between the five-year goal and 10-year goal evenly over the next five years.

Annual Savings Goal with Reduction in GPCD (MG) – This column shows what reductions from the baseline GPCD would yield in terms of volume each year as more water is saved. The volumes indicated here are what target GPCD goals look like expressed in million gallons. Annual volumes were derived using the formula: (baseline total GPCD – target total GPCD for that year) x 365 days ÷ 1,000,000 gallons.

Total Savings for All Current Quantified Activities (MG) – Total quantified savings for all current conservation activities and savings from water loss reduction. Refer to Tables 5-1 and 5-2 for details on these savings.

Over (Short) – The amount that the utility's total quantified savings for all current conservation activities (since 2012), including water loss reduction, is over or below the volume represented by reductions in GPCD each year. If the quantified savings are less than these target volumes, the value will appear in parentheses.

Table 3-2. Utility Water Conservation Plan Goals — Total GPCD.

Year #	Year	Utility Population	Total GPCD Goals	Annual Savings Goal with Reduction in GPCD (MG)	Total Savings for All Current Quantified Activities (MG)	Over (Short) (MG)
0	**Baseline**	-	94	0	0	0
1	2014	7,423	96	(6)	13	19
2	2015	7,428	98	(12)	(1)	11
3	2016	7,434	101	(18)	(1)	17
4	2017	7,439	103	(24)	0	23
5-year Goal	2018	7,445	105	(30)	0	30
6	2019	7,450	104	(27)	0	27
7	2020	7,539	103	(25)	0	25
8	2021	7,628	102	(22)	0	22
9	2022	7,718	101	(20)	0	20
10-year Goal	2023	7,807	100	(17)	0	17

[13] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for total GPCD from the utility's most recently submitted five-year water conservation plan was used.

3.3 Utility Water Conservation Plan Goals – Water Loss GPCD

Table 3-3 shows how Union WSC's most recent water loss audit compares with five- and 10-year water loss goals in its water conservation plan. The following definitions pair with the column headers in Table 3-2.

Utility Population – Estimated utility service area population for the years indicated.

Water Loss GPCD Goals – Water loss GPCD goals start with the utility's baseline[14] for water loss GPCD and progress in subsequent years to match 5- and 10-year water loss goals indicated in a utility's five-year water conservation plan on file with the TWDB. The first five annual GPCD goals were developed by spreading the difference between the baseline and five-year goal evenly over five years. The second five annual GPCD goals spread the difference between the five-year goal and 10-year goal evenly over the next five years.

Yearly Savings Goal with Reduction in GPCD (MG) – This column shows what reductions from the baseline water loss GPCD would yield in terms of volume each year as more water is saved. The volumes indicated here are what target water loss GPCD goals look like expressed in million gallons. Annual volumes were derived using the formula: (baseline water loss GPCD – target water loss GPCD for that year) x 365 days ÷ 1,000,000 gallons.

Total Savings from Water Loss Reduction (MG) – The difference between a utility's established baseline for water loss GPCD and the most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB. If water loss GPCD has increased from the utility's baseline to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount. Reference Table 5-2 for savings from water loss reduction.

Over (Short) – The amount that the utility's total savings from water loss reduction is over or below the volume represented by reductions in GPCD each year. If water loss reduction savings are less than these target volumes, the value will appear in parentheses.

Table 3-3. Utility Water Conservation Plan Goals — Water Loss GPCD.

Year #	Year	Utility Population	Water Loss GPCD Goals	Yearly Savings Goal with Reduction in GPCD (MG)	Total Savings from Water Loss Reduction (MG)	Over (Short) (MG)
0	**Baseline**	-	38.00	0	0	0
1	2014	7,423	37.60	1	(14)	(15)
2	2015	7,428	37.20	2	(14)	(16)
3	2016	7,434	36.80	3	(14)	(17)
4	2017	7,439	36.40	4	(14)	(18)
5-year Goal	2018	7,445	36.00	5	(14)	(19)
6	2019	7,450	33.60	12	(14)	(26)
7	2020	7,539	31.20	19	(14)	(32)
8	2021	7,628	28.80	26	(14)	(40)
9	2022	7,718	26.40	33	(14)	(47)
10-year Goal	2023	7,807	24.00	40	(14)	(54)

[14] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.

4 Implemented Activities

Below is a list of completed activities with estimated water savings. Note that drought response and other measures are not included in the utility's water savings because they are temporary, awareness-based or not able to be accurately quantified on an annual basis.

These are not savings projections of potential future activities. Estimated savings are based on measures that have actually been implemented. If savings are shown to persist in future years, it is because the measure is permanent, such as an ordinance, or the savings are assumed to continue for the reason listed under the itemized activity. Estimated savings from water rate increases are the one exception to these conditions.

Water Rate Increases

Savings from water rate increases were included because entities such as the U.S. Environmental Protection Agency and others indicate specific savings for utilities that raise rates (Texas Water Development Board, 2013; U.S. E.P.A., 1998; Whitcomb, 1999). This project includes surveys of several utilities that have minimal education efforts, perform no other substantive conservation activities, and yet experienced significant demand reduction that coincided with rate increases. In those cases, savings estimates matched up closely with decreases in total GPCD. For many smaller utilities, especially those with customers lacking disposable income, this measure is the only tool used to conserve other than water loss reduction.

The following assumptions were made for water rate increases:

- The model assumes that savings persist into future years because it is expected that the utility will continue to make periodic rate increases in line with the percentage increases from previous years.
- Only the last two rate increases for a utility were quantified.
- Savings grow with demand because as new customers enter the service area, they are assumed to adhere to the same price elasticity model estimates.
- A weighted average for savings was used when rate increases differed between residential and industrial-commercial-institutional (ICI) customers based on the individual utility's customer class breakdown.
- When a utility raised rates using tiered rate conservation pricing, a 50/50 savings split was used when increases differed between base and volumetric rates.
    - The reasoning is that all customers must react to the base increase, yet the pricing signal is stronger when volumetric rate increases affect the higher usage customers.
    - The 50/50 split is reasonable because many customers will not reach the higher volumetric tiers.
    - Studies show that most customers do not actually know they have reached the higher volumetric tiers; just that their bill has increased (Texas Water Development Board, 2013).

4.1 Itemized Activities

1. **Utility Website**
    a. Easy-to-use website with conservation tips and water rates
    b. Features contact information for Public Works staff and customer service

2. **Continuing Public Education**
    a. The utility engages the public in many ways including:
        i. Brochures, bill messages, displays, and exhibits

3. **Water Loss Reduction Savings**[15]
    a. Loss of 14 MG annually in 2015
    b. Water loss reduction savings = the difference between a utility's baseline[16] water loss GPCD submitted in its most recent 5-year water conservation plan and its most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB
    c. If water loss GPCD has increased from the utility's baseline or historic 5-year average to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount.
    d. All savings estimates grow each year at the same rate population figures for the utility grow in the regional water plan.

4. **Water Rate Increase**
    a. Last rate increase:[17]
        i. 25% increase in 2014
    b. Estimated customer demand reduction of 5.0%
    c. Savings is cumulative and based on more than one source[18] (U.S. EPA, 1998; Whitcomb, 1999)
    d. Savings from rate increases are shown to persist over time, however, note that savings from these pricing signals will likely decrease if rates remain the same in future years.

[15] If current water loss levels exceed a utility's baseline, this value is treated as a deduction from total quantified savings.
[16] In the absence of having a baseline figure provided in the utility's most recently submitted 5-year water conservation plan, the historic 5-year average for water loss GPCD in the plan was used.
[17] Correspondence with utility staff.
[18] The study estimates a 2% demand reduction with 10% increase in price on a targeted customer class. By applying a ratio, it is possible to determine the savings for lower or higher percentage increases.

5 Summary of Savings

Table 5-1. Savings by Water Conservation Activity (MG).

Year	Water Rate Increases	TOTAL SAVINGS
2009		0.0
2010		0.0
2011		0.0
2012		0.0
2013		0.0
2014	13	12.7
2015	13	12.8
2016	13	12.9
2017	13	13.1
2018	13	13.2

6 Suggested Activities

Up to four activities were chosen as potential suggested activities for individual reports. These activities are: AMI system with customer portal, twice-per-week (or less) outdoor watering ordinances, strategic water rate increases, and rain barrels.

Activities were chosen because they are:

- Achievable
- Prevalence of vendors that can actually implement them
- Acceptability to city councils, MUD boards, et al.
- Easily adopted
- Cost effective
- Yield high savings relative to cost

AMI systems with customer engagement portals were also chosen because they represent a profusion of future applications that will undoubtedly continue to advance conservation efforts. AMI and meter data management (MDM) companies are developing new and innovative ways to benefit water providers, customers, and ultimately states that are pushing conservation and usage analytics further.

Each utility should be cognizant of the potential impact that these suggested activities may have on its own unique rate and revenue situation.

Benefits to consider:

- Avoided water supply and wastewater costs
  - The higher water purchase, transmission, and distribution costs are, the greater the potential benefit realized when large amounts of water are conserved with these activities.
- Avoided system expansion costs
  - Conserving water may allow a utility to postpone building new system capacity by decreasing demand even as population grows.

Costs to consider:

- Staff time and resources
- Unit cost per unit saved
- Implementation costs
- Stakeholder agreement and support
- Other overhead and budget considerations

6.1 Suggested Activities with Savings Estimates

1. Twice-a-week Outdoor Watering Restriction Ordinance
    a. Potentially 5.05% savings of total demand (Hermitte and Mace, 2012; Sierra Club-Lone Star Chapter and National Wildlife Federation, 2015)
        i. Average Region M savings
        ii. Specific percentage of outdoor usage unknown for your utility at this time
    b. Savings could be 13 MG per year with current demand.
    c. See Table 6-1 for potential savings from this measure compared with the city's WMS supply volumes targets.

Table 6-1. Current Savings + Potential Savings from 2x per Week Watering Ordinance (MG).

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Potential Savings from Ordinance	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)
2016	13	(14)	(1)	13	0	0	0	12
2017	13	(14)	(0)	13	0	0	0	13

2022	14	(14)	(0)	14	0	0	0	14
2023	14	(14)	(0)	14	0	0	0	14
2024	14	(14)	(0)	14	0	0	0	14
2025	14	(14)	(0)	14	0	0	0	14
2026	14	(15)	(0)	14	0	0	0	14
2027	14	(15)	(0)	15	0	0	0	14
2028	15	(15)	(0)	15	0	0	0	14
2029	15	(15)	(0)	15	0	0	0	14
2030	15	(15)	(0)	15	0	0	0	15
2031	15	(15)	(0)	15	1	0	1	14
2032	15	(16)	(0)	15	2	0	2	13
2033	15	(16)	(0)	15	2	0	2	12
2034	15	(16)	(1)	16	3	0	3	12
2035	15	(16)	(1)	16	4	0	4	11
2036	16	(16)	(1)	16	5	0	5	10
2037	16	(16)	(1)	16	6	0	6	10
2038	16	(17)	(1)	16	7	0	7	9
2039	16	(17)	(1)	16	7	0	7	8
2040	16	(17)	(1)	16	8	0	8	7

2. Advanced Metering Infrastructure with Customer Engagement Portal

These portals, along with mobile applications and billing statements, can provide customers with much more access to their water use data in simple and compelling formats. This access and comparison with other customers' usage can reduce water use through changed behavior, as well as provide an opportunity for other conservation programs to be offered to the customer for increased adoption and additional savings. AMI systems support leak notification and web portals with real-time data. Any water loss reduction savings that these systems also yield were included in the water loss assessment of individual reports for this project.

- **a.** Specific utility results will vary based on portal features and frequency of customer notifications
- **b.** Potential savings estimate assumes 20% of residential customers will use and save water due to the portal (Westin Engineering, 2015)
- **c.** Estimate assumes customers will save 10% of total annual use due to the portal
    - i. Savings estimate of 10% is an average of results from multiple studies (Chesnutt and Mitchell, 2013; East Bay Municipal Utility District, 2014; IBM, 2011; Texas A&M and Texas Water Resources Institute, 2016; Westin Engineering, 2015)
- **d.** Residential customers' use assumed to make up approximately 67% of all retail customers' use based on utility profile information submitted to the TWDB
    - i. This was the most common percentage of residential use among participating utilities in this project.
    - ii. Actual customer class demand percentages will vary by utility.
- **e.** 20% of residential customers saving 10% with this customer class breakdown amounts to 1.34% of total demand
- **f.** Savings are assumed to increase along with demand as connections increase each year[19]
- **g.** See Table 6-2 for potential savings from this measure compared with the utility's WMS supply volumes targets.

[19] The 10% consumption reduction figure for 20% of residential customers is conservative, but savings could be greater when monitored yearly as customer engagement increases.

Table 6-2. Current Savings + Potential Savings from AMI with Customer Portal (MG).

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Potential Savings from AMI with Customer Portal	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)
2016	13	(14)	(1)	3	0	0	0	3

2036	16	(16)	(1)	4	5	0	5	(1)
2037	16	(16)	(1)	4	6	0	6	(2)
2038	16	(17)	(1)	4	7	0	7	(3)
2039	16	(17)	(1)	4	7	0	7	(4)
2040	16	(17)	(1)	4	8	0	8	(5)

3. Rain Barrels
   a. In Region M, utilities could save approximately 13.1 gallons per year per gallon of capacity rebated, sold, or distributed (GDS Associates, 2002).
   b. Estimated 10-year useful life for most barrels

Statewide Water Conservation Quantification Project
City of Weslaco Report • 2017

1 Introduction

In Texas' 2017 State Water Plan, municipal water conservation is projected to meet 9.6 percent[1] of the state's future water needs by 2070. According to the 16 regional water plans that comprise the state water plan, this is expected to be achieved through a variety of measures such as installation of water efficient plumbing fixtures, water conservation pricing structures, water system audits, landscape irrigation ordinances, as well as other water conservation activities. The 9.6 percent is "in addition to the estimated share of future passive conservation savings from plumbing codes and water efficiency standards, which are embedded in municipal water demand projections" (Texas Water Development Board, 2017).

In 2015, the Texas Legislature appropriated funds to the Texas Water Development Board (TWDB) to fund a research project principally charged with quantitatively determining the savings of municipal water conservation activities being implemented in relation to the recommended conservation goals (supply volumes) in the State Water Plan. As part of the project, individual reports were completed for all participating utilities.

With this report, utilities will benefit by receiving a clear and concise picture of its water conservation goals alongside estimated savings from quantifiable activities. In the event that current activity savings may not be able to reach long-term goals, this report offers suggestions on how utilities can reach water conservation goals with activities that are effective, easily adopted, have widespread appeal, and are quantifiable.

2 Municipal Conservation Terminology and Review of Methodology Used by Regional Planners

To make use of the results of this study, it is important to understand several key terms used in the water planning process.

What is a water user group?

In this report, a water user group (WUG) refers to a retail water provider in the form a city, municipal utility district, water control and improvement district, special utility district, water supply corporation, fresh water supply district, or other type of water utility. The TWDB further defines WUGs as one of the following (Texas Water Development Board, 2016b):

- Cities and towns with a population of 500 or more
- Non-city utilities providing more than 280 acre-feet per year per year of water for municipal use
- Collective reporting units (CRUs) consisting of grouped utilities having a common association

[1] Equal to 811,224 acre-feet per year in conservation savings.

- County-Wide WUGs:
    - County-Other (Rural/unincorporated areas of municipal water use)
    - Manufacturing
    - Steam electric power generation

What is a recommended water management strategy?

A recommended water management strategy (WMS) is a measure that will help ensure WUGs have adequate water supplies for their end users well into the future. WMS examples include river diversions, groundwater use, reservoir and aquifer development, and irrigation conservation. When WMS is referred to in this report, it refers only to municipal conservation, which may include water loss reduction as a part of the same strategy.

What is a WMS supply volume?

A WMS supply volume is the amount of water that a given strategy is expected to yield each decade in the planning period if carried out by the WUG. In this report, a WMS supply volume is the amount of water recommended to come from municipal water conservation.

Some regional water plans separate this strategy's supply volume into a volume for municipal water conservation and a volume for water loss reduction for each decade. The total strategy supply volume is the sum of both. A regional water plan may also refer to "advanced conservation" as part of this strategy. Advanced conservation usually indicates that the volume could be achieved through a more robust mix of conservation activities described in the plan.

2.1 Regional Planning Group Approach to Determining Supply Volumes

Each regional water planning group (RWPG) is responsible for producing its own individual plan that, if executed, will provide sufficient water to its WUGs throughout a 50-year planning period. These plans are completed in five-year cycles, with the most recent edition being completed in 2016. The 2016 regional plans make up the 2017 State Water Plan, which sets out WMS supply volumes for the years 2020 through 2070.

The decadal WMS supply volumes for municipal conservation were established by each of the RWPGs in much the same manner. The RWPGs generally followed the guidelines of the Texas Legislature's Water Conservation Implementation Task Force on the pace utilities should target to reduce gallons per capita per day (GPCD)[2] consumption levels.

The targeted reductions used by most regions follow this formula:

- For municipal WUGs with water use of 140 GPCD and greater, the goal is to reduce per capita water use by one percent per year until the level of 140 GPCD is reached,

[2] Regional water planning GPCD is defined as the annual volume of water pumped, diverted, or purchased minus the volume exported (sold) to other water systems or large industrial facilities divided by the permanent resident population of the Municipal Water User Group in the regional water planning process divided by 365. Saline and reused/recycled water are not included in this volume (Texas Water Development Board, 2012).

after which, the goal is to reduce per capita water use by one-fourth percent per year for the remainder of the planning period (Texas Water Development Board, 2016j).

The yearly reductions in GPCD for a given WUG are then converted into recommended supply volumes in acre-feet per year for each decade as the reductions in consumption continue. Some regions reduce GPCD by slightly different percentages before and after the 140 GPCD threshold, some do not apply further reductions in GPCD for WUGs once they reach 140 GPCD, while others recommend only "advanced conservation" activities once WUGs meet 140 GPCD.

2.2 Methodology

In order to complete a uniform quantification process, the first engagement was with utilities that agreed to participate and collected as much relevant data as possible. These data included, among many others, historical GPCD consumption figures, advanced metering infrastructure (AMI) specifications, and detailed feedback on each conservation activity being implemented. Personal interviews focused on determining when and to what extent these activities were being employed, as well as assessing plans to continue such conservation. Examples of frequently implemented activities include tiered water rate conservation pricing, strategic water rate increases, outdoor irrigation audits and ordinances, and rain barrel distribution.

Subsequently, each utility's conservation activities were quantified through several different means, including evidence-based studies, utility field results and savings determinations, manufacturer guarantees, water loss audits, TWDB studies, and other information that assigned a savings value to the activity's implementation.

Every conservation activity studied and quantified has a gallons-per-year estimate, useful life, and decay rate (if applicable) associated with it. Some activities' savings are projected to grow as demand grows over time, while some savings are constant each year and subside once useful life has run its course. For expanded methodology and details on studies and formulas used to determine activity savings, refer to Section 6 of the State Report included as part of this document.

Once analyzed, the resulting savings estimates from each utility were compared with the recommended WMS supply volumes in its respective regional plan to determine if the savings met, exceeded, or fell short of those volumes. Individual utility savings were aggregated to compare with regional volumes, and regional savings were aggregated to compare with state volumes.

It is important to note that this report quantified activity savings—not including water loss reduction—for the WMS supply volume comparison dating back to 2012. The reason for this is, with a few exceptions, the regional planners used 2011 as the base year for establishing potential WMS supply volumes.[3] In addition, any conservation savings achieved through 2011 are assumed to be accounted for in the regional water planning GPCD for that year.[4] Thus, quantifying from 2012 and forward is the most accurate way to determine if utilities are meeting

[3] Confirmed via personal communication with Region C, H, K, and L Plan consultants.
[4] It was established with TWDB planning staff that 2011 GPCD levels were chosen because they represented the most current water use and conservation patterns at the time.

the recommended conservation volumes in the regional plans. This assumption is by no means 100 percent accurate, however. Some previously implemented activities' savings persist into future years beyond this starting point, while some activities' savings have ceased. One year's GPCD will not necessarily include all savings yielded by conservation activities that came before it, but the quantification assessment must have a starting point.

2.3 Quantifiable Savings

The key to the project being useful and reliable is that the results from year to year are measurable. Quantifying conservation activities that can be accurately measured provides greater certainty and better planning for all stakeholders.

While many utilities are engaged in a variety of conservation activities, not all can currently be properly measured. Some examples of these activities include education initiatives, website and social media engagement, and enforcement for water waste. That does not mean these measures are not essential. Education of consumers, for example, is a fundamental activity that makes all others effective, but little hard data exists to quantify the results of education alone.

In addition, the work of conservation coordinators can have a particularly significant effect on the savings of all other activities, but the specific savings attributed to that staff role is difficult to quantify.

3 Results

This report compares Weslaco's current water conservation activities and their quantified savings to two metrics: 1) Region M Water Plan's (Texas Water Development Board, 2016k) recommended WMS supply volumes for municipal conservation, and 2) Weslaco's own 5- and 10-year goals as established in its most recent water conservation plan submitted to the TWDB.

The WMS supply volumes for municipal water conservation are laid out by decade (2020 – 2070) in the regional water plans to serve as benchmarks for what each utility could achieve via that strategy during a 50-year planning period.[5]

The 5- and 10-year goals in Weslaco's most recent water conservation plan are established by the utility as realistic targets for reducing consumption over that timeframe. These reductions[6] are expressed in decreasing total GPCD[7] consumption and water loss GPCD.[8] [9]

The estimated savings in Tables 3-1 through 3-3 indicate the best information available as

---

[5] Some regional water plans separate this strategy volume into a volume for water conservation and a volume for water loss reduction for each decade. The total strategy volume is the sum of both.

[6] Occasionally, some utilities expect consumption to increase due to various reasons, such as an incoming industrial presence expected to raise consumption figures for the entire service area.

[7] As defined in TWDB water conservation plan annual report (Texas Water Development Board, 2016o): (Total Gallons in System ÷ Permanent Population) ÷ 365

[8] These plans also have targets for residential GPCD and water loss as a percentage (rather than GPCD), but this report does not address those goals.

[9] As defined in TWDB water conservation plan annual report (Texas Water Development Board, 2016o): (Total Water Loss ÷ Permanent Population) ÷ 365

provided by utility staff. Some ongoing activities may not be known and are within a utility's service area are implemented on a micro-scale that may not be quantified. Individual households and businesses may be implementing conservation measures that are unknown and therefore cannot be included in the report.

Explanation of approach to assessing water loss reduction savings

Water loss reduction savings are defined as the volume of water participating utilities are realizing from their water loss mitigation efforts. For this report, this value is the difference between each individual utility's baseline[10] for water loss GPCD and its most recent water loss GPCD reported in 2015 water loss audits on file with TWDB. Savings from all water loss reduction efforts—including pipe replacements and leak repair—are assumed to be included in this comparison to a utility's baseline.

Note that because a single year (2015) value was used for comparison, it is possible that the 2015 value could be anomalous due to a number of events that may have occurred that year, such as a water main break, a particularly wet year, or a robust effort by the utility to curtail water loss. This will distort future savings figures that were carried forward in the study because water loss will inevitably increase or decrease in later years.

Ideally, using a rolling five-year average in the calculation would correct such anomalies. However, there was insufficient data to do that for every utility. The approach was to use the most complete water loss data possible, which was represented by the 2015 water loss audit. This problem will be further minimized, as continued data collection will allow five-year averages to be calculated for a majority of utilities.

In this way, water loss savings estimates are different from all other activity savings estimates in the project. Whether savings were positive or negative depended on where individual utilities established their own baselines or where their five-year average started, and what water loss GPCD value was reported in 2015.

3.1 Current Savings Compared to Conservation WMS Supply Volume (in million gallons) in Regional Water Plan

Table 3-1 shows the 2070 outlook for Weslaco with the utility's yearly recommended WMS supply volume in million gallons (MG) alongside its water savings from implemented activities, including from water loss reduction. These activities and their associated savings are covered in greater detail in Sections 4 and 5.

Starting in 2015, this table compares all quantified conservation activity and the recommended conservation WMS supply volume for the planning period. The following definitions pair with the column headers in Table 3-1.

<u>Actual Current Conservation Activity Savings</u> – All quantified activities currently being performed by the utility, *excluding* savings from water loss reduction. The regional planners used

[10] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.

2011 GPCD as the baseline for determining future conservation WMS supply volumes, therefore the study quantifies utility savings starting in 2012 for this comparison. The summary of these savings can be referenced in Table 5-1.

Actual Water Loss Reduction Savings (as of 2015) – The difference between the baseline[11] for water loss GPCD and most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB. [12] The summary of these savings can be referenced in Table 5-2.

Total Savings from All Conservation Activity – Actual Current Conservation Activity Savings plus Actual Water Loss Reduction Savings (as of 2015).

Conservation WMS Volume – The recommended municipal water conservation supply volume in the regional plan for the decades ranging from 2020 to 2070. These volumes are converted to MG from the values listed in the plan in acre-feet and then calculated in annual increments.

Water Loss Reduction WMS Volume – Some regional water plans have a separate WMS volume for water conservation and for water loss reduction for each decade. If a WUG's regional plan has a WMS volume for water loss reduction, this column will have values other than zero.

Total Yearly WMS Volume – The sum of the Conservation WMS Volume and Water Loss Reduction WMS Volume.

Over (Short) – The amount that the utility's Total Savings from All Conservation Activity (since 2012), is over or below the Total Yearly WMS Volume in the regional water plan. If the amount falls below the WMS volume, it will appear in parentheses.

[11] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.

[12] If water loss GPCD has increased from the utility's baseline or historic five-year average to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount.

Table 3-1. Current Savings Compared to Conservation WMS Supply Volume (MG) in Regional Water Plan.

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)

3.2 Utility Water Conservation Plan Goals – Total GPCD

Table 3-2 shows how Weslaco's quantified savings from its implemented activities compare with 5- and 10-year goals established in its individual water conservation plan submitted to the TWDB. The following definitions pair with the column headers in Table 3-2.

Utility Population – Estimated utility service area population for the years indicated.

Total GPCD Goals – Total GPCD goals start with the utility's baseline[13] for total GPCD and progress in subsequent years to match 5- and 10-year goals indicated in a utility's five-year water conservation plan on file with the TWDB. The first five annual GPCD goals were developed by spreading the difference between the baseline and five-year goal evenly over five years. The second five annual GPCD goals spread the difference between the five-year goal and 10-year goal evenly over the next five years.

Annual Savings Goal with Reduction in GPCD (MG) – This column shows what reductions from the baseline GPCD would yield in terms of volume each year as more water is saved. The volumes indicated here are what target GPCD goals look like expressed in million gallons. Annual volumes were derived using the formula: (baseline total GPCD – target total GPCD for that year) x 365 days ÷ 1,000,000 gallons.

Total Savings for All Current Quantified Activities (MG) – Total quantified savings for all current conservation activities and savings from water loss reduction. Refer to Tables 5-1 and 5-2 for details on these savings.

Over (Short) – The amount that the utility's total quantified savings for all current conservation activities (since 2012), including water loss reduction, is over or below the volume represented by reductions in GPCD each year. If the quantified savings are less than these target volumes, the value will appear in parentheses.

Table 3-2. Utility Water Conservation Plan Goals — Total GPCD.

Year #	Year	Utility Population	Total GPCD Goals	Annual Savings Goal with Reduction in GPCD (MG)	Total Savings for All Current Quantified Activities (MG)	Over (Short) (MG)
0	**Baseline**	-	134	0	0	0
1	2015	39,474	137	(46)	301	347
2	2016	40,620	140	(95)	309	404
3	2017	41,766	144	(146)	316	463
4	2018	42,913	147	(200)	324	525
5-year Goal	2019	44,059	150	(257)	331	589
6	2020	45,205	150	(257)	339	597
7	2021	46,298	149	(257)	346	603
8	2022	47,390	149	(256)	354	610
9	2023	48,483	148	(255)	361	616
10-year Goal	2024	49,576	148	(253)	368	622

[13] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for total GPCD from the utility's most recently submitted five-year water conservation plan was used.

3.3 Utility Water Conservation Plan Goals – Water Loss GPCD

Table 3-3 shows how Weslaco's most recent water loss audit compares with five- and 10-year water loss goals in its water conservation plan. The following definitions pair with the column headers in Table 3-2.

Utility Population – Estimated utility service area population for the years indicated.

Water Loss GPCD Goals – Water loss GPCD goals start with the utility's baseline[14] for water loss GPCD and progress in subsequent years to match 5- and 10-year water loss goals indicated in a utility's five-year water conservation plan on file with the TWDB. The first five annual GPCD goals were developed by spreading the difference between the baseline and five-year goal evenly over five years. The second five annual GPCD goals spread the difference between the five-year goal and 10-year goal evenly over the next five years.

Yearly Savings Goal with Reduction in GPCD (MG) – This column shows what reductions from the baseline water loss GPCD would yield in terms of volume each year as more water is saved. The volumes indicated here are what target water loss GPCD goals look like expressed in million gallons. Annual volumes were derived using the formula: (baseline water loss GPCD – target water loss GPCD for that year) x 365 days ÷ 1,000,000 gallons.

Total Savings from Water Loss Reduction (MG) – The difference between a utility's established baseline for water loss GPCD and the most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB. If water loss GPCD has increased from the utility's baseline to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount. Reference Table 5-2 for savings from water loss reduction.

Over (Short) – The amount that the utility's total savings from water loss reduction is over or below the volume represented by reductions in GPCD each year. If water loss reduction savings are less than these target volumes, the value will appear in parentheses.

Table 3-3. Utility Water Conservation Plan Goals — Water Loss GPCD.

Year #	Year	Utility Population	Water Loss GPCD Goals	Yearly Savings Goal with Reduction in GPCD (MG)	Total Savings from Water Loss Reduction (MG)	Over (Short) (MG)
0	**Baseline**	-	24.00	0	0	0
1	2015	39,474	22.20	26	72	46
2	2016	40,620	20.40	53	74	21
3	2017	41,766	18.60	82	76	(6)
4	2018	42,913	16.80	113	78	(34)
5-year Goal	2019	44,059	15.00	145	80	(64)
6	2020	45,205	14.60	155	82	(73)
7	2021	46,298	14.20	166	84	(81)
8	2022	47,390	13.80	176	86	(90)
9	2023	48,483	13.40	188	88	(99)
10-year Goal	2024	49,576	13.00	199	90	(109)

[14] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.

4 Implemented Activities

Below is a list of completed activities with estimated water savings. Note that drought response and other measures are not included in the utility's water savings because they are temporary, awareness-based or not able to be accurately quantified on an annual basis.

These are not savings projections of potential future activities. Estimated savings are based on measures that have actually been implemented. If savings are shown to persist in future years, it is because the measure is permanent, such as an ordinance, or the savings are assumed to continue for the reason listed under the itemized activity. Estimated savings from water rate increases are the one exception to these conditions.

Water Rate Increases

Savings from water rate increases were included because entities such as the U.S. Environmental Protection Agency and others indicate specific savings for utilities that raise rates (Texas Water Development Board, 2013; U.S. E.P.A., 1998; Whitcomb, 1999). This project includes surveys of several utilities that have minimal education efforts, perform no other substantive conservation activities, and yet experienced significant demand reduction that coincided with rate increases. In those cases, savings estimates matched up closely with decreases in total GPCD. For many smaller utilities, especially those with customers lacking disposable income, this measure is the only tool used to conserve other than water loss reduction.

The following assumptions were made for water rate increases:

- The model assumes that savings persist into future years because it is expected that the utility will continue to make periodic rate increases in line with the percentage increases from previous years.
- Only the last two rate increases for a utility were quantified.
- Savings grow with demand because as new customers enter the service area, they are assumed to adhere to the same price elasticity model estimates.
- A weighted average for savings was used when rate increases differed between residential and industrial-commercial-institutional (ICI) customers based on the individual utility's customer class breakdown.
- When a utility raised rates using tiered rate conservation pricing, a 50/50 savings split was used when increases differed between base and volumetric rates.
    - The reasoning is that all customers must react to the base increase, yet the pricing signal is stronger when volumetric rate increases affect the higher usage customers.
    - The 50/50 split is reasonable because many customers will not reach the higher volumetric tiers.
    - Studies show that most customers do not actually know they have reached the higher volumetric tiers; just that their bill has increased (Texas Water Development Board, 2013).

4.1 Itemized Activities

1. **Utility Website**
   a. Easy-to-use website with conservation tips and water rates
   b. Features contact information for Public Works staff and customer service

2. **Continuing Public Education**
   a. The utility engages the public in many ways including:
      i. Brochures, bill messages, displays, and exhibits

3. **Water Loss Reduction Savings**[15]
   a. Savings of 72 MG annually in 2015
   b. Water loss reduction savings = the difference between a utility's baseline[16] water loss GPCD submitted in its most recent 5-year water conservation plan and its most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB
   c. If water loss GPCD has increased from the utility's baseline or historic 5-year average to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount.
   d. All savings estimates grow each year at the same rate population figures for the utility grow in the regional water plan.

4. **Water Rate Increase**
   a. Last rate increase:[17]
      i. 50% increase in 2014
   b. Estimated customer demand reduction of 10.0%
   c. Savings is cumulative and based on more than one source[18] (U.S. EPA, 1998; Whitcomb, 1999)
   d. Savings from rate increases are shown to persist over time, however, note that savings from these pricing signals will likely decrease if rates remain the same in future years.

[15] If current water loss levels exceed a utility's baseline, this value is treated as a deduction from total quantified savings.
[16] In the absence of having a baseline figure provided in the utility's most recently submitted 5-year water conservation plan, the historic 5-year average for water loss GPCD in the plan was used.
[17] Correspondence with utility staff.
[18] The study estimates a 2% demand reduction with 10% increase in price on a targeted customer class. By applying a ratio, it is possible to determine the savings for lower or higher percentage increases.

5 Summary of Savings

Table 5-1. Savings by Water Conservation Activity (MG).

Year	Water Rate Increases	TOTAL SAVINGS
2009		0.0
2010		0.0
2011		0.0
2012	213	213.0
2013	218	218.0
2014	224	223.8

2023	48,483	19.00	88
2024	49,576	19.00	90

6 Suggested Activities

Up to four activities were chosen as potential suggested activities for individual reports. These activities are: AMI system with customer portal, twice-per-week (or less) outdoor watering ordinances, strategic water rate increases, and rain barrels.

Activities were chosen because they are:

- Achievable
- Prevalence of vendors that can actually implement them
- Acceptability to city councils, MUD boards, et al.
- Easily adopted
- Cost effective
- Yield high savings relative to cost

AMI systems with customer engagement portals were also chosen because they represent a profusion of future applications that will undoubtedly continue to advance conservation efforts. AMI and meter data management (MDM) companies are developing new and innovative ways to benefit water providers, customers, and ultimately states that are pushing conservation and usage analytics further.

Each utility should be cognizant of the potential impact that these suggested activities may have on its own unique rate and revenue situation.

Benefits to consider:

- Avoided water supply and wastewater costs
    - The higher water purchase, transmission, and distribution costs are, the greater the potential benefit realized when large amounts of water are conserved with these activities.
- Avoided system expansion costs
    - Conserving water may allow a utility to postpone building new system capacity by decreasing demand even as population grows.

Costs to consider:

- Staff time and resources
- Unit cost per unit saved
- Implementation costs
- Stakeholder agreement and support
- Other overhead and budget considerations

6.1 Suggested Activities with Savings Estimates

1. Twice-a-week Outdoor Watering Restriction Ordinance
    a. Potentially 5.05% savings of total demand (Hermitte and Mace, 2012; Sierra Club-Lone Star Chapter and National Wildlife Federation, 2015)
        i. Average Region M savings
        ii. Specific percentage of outdoor usage unknown for your utility at this time
    b. Savings could be 119 MG per year with current demand.
    c. See Table 6-1 for potential savings from this measure compared with the city's WMS supply volumes targets.

Table 6-1. Current Savings + Potential Savings from 2x per Week Watering Ordinance (MG).

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Potential Savings from Ordinance	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)
2016	235	74	309	119	44	0	44	384
2017	240	76	316	121	44	0	44	394

2. Advanced Metering Infrastructure with Customer Engagement Portal

These portals, along with mobile applications and billing statements, can provide customers with much more access to their water use data in simple and compelling formats. This access and comparison with other customers' usage can reduce water use through changed behavior, as well as provide an opportunity for other conservation programs to be offered to the customer for increased adoption and additional savings. AMI systems support leak notification and web portals with real-time data. Any water loss reduction savings that these systems also yield were included in the water loss assessment of individual reports for this project.

- **a.** Specific utility results will vary based on portal features and frequency of customer notifications
- **b.** Potential savings estimate assumes 20% of residential customers will use and save water due to the portal (Westin Engineering, 2015)
- **c.** Estimate assumes customers will save 10% of total annual use due to the portal
    - i. Savings estimate of 10% is an average of results from multiple studies (Chesnutt and Mitchell, 2013; East Bay Municipal Utility District, 2014; IBM, 2011; Texas A&M and Texas Water Resources Institute, 2016; Westin Engineering, 2015)
- **d.** Residential customers' use assumed to make up approximately 67% of all retail customers' use based on utility profile information submitted to the TWDB
    - i. This was the most common percentage of residential use among participating utilities in this project.
    - ii. Actual customer class demand percentages will vary by utility.
- **e.** 20% of residential customers saving 10% with this customer class breakdown amounts to 1.34% of total demand
- **f.** Savings are assumed to increase along with demand as connections increase each year[19]
- **g.** See Table 6-2 for potential savings from this measure compared with the utility's WMS supply volumes targets.

[19] The 10% consumption reduction figure for 20% of residential customers is conservative, but savings could be greater when monitored yearly as customer engagement increases.

Table 6-2. Current Savings + Potential Savings from AMI with Customer Portal (MG).

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Potential Savings from AMI with Customer Portal	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)
2016	235	74	309	31	44	0	44	297
2017	240	76	316	32	44	0	44	305

2039	362	120	482	48	448	0	448	83
2040	367	122	489	49	465	0	465	74

3. Rain Barrels
    a. In Region M, utilities could save approximately 13.1 gallons per year per gallon of capacity rebated, sold, or distributed (GDS Associates, 2002).
    b. Estimated 10-year useful life for most barrels

Statewide Water Conservation Quantification Project
Zapata County Waterworks Report • 2017

1 Introduction

In Texas' 2017 State Water Plan, municipal water conservation is projected to meet 9.6 percent[1] of the state's future water needs by 2070. According to the 16 regional water plans that comprise the state water plan, this is expected to be achieved through a variety of measures such as installation of water efficient plumbing fixtures, water conservation pricing structures, water system audits, landscape irrigation ordinances, as well as other water conservation activities. The 9.6 percent is "in addition to the estimated share of future passive conservation savings from plumbing codes and water efficiency standards, which are embedded in municipal water demand projections" (Texas Water Development Board, 2017).

In 2015, the Texas Legislature appropriated funds to the Texas Water Development Board (TWDB) to fund a research project principally charged with quantitatively determining the savings of municipal water conservation activities being implemented in relation to the recommended conservation goals (supply volumes) in the State Water Plan. As part of the project, individual reports were completed for all participating utilities.

With this report, utilities will benefit by receiving a clear and concise picture of its water conservation goals alongside estimated savings from quantifiable activities. In the event that current activity savings may not be able to reach long-term goals, this report offers suggestions on how utilities can reach water conservation goals with activities that are effective, easily adopted, have widespread appeal, and are quantifiable.

2 Municipal Conservation Terminology and Review of Methodology Used by Regional Planners

To make use of the results of this study, it is important to understand several key terms used in the water planning process.

What is a water user group?

In this report, a water user group (WUG) refers to a retail water provider in the form a city, municipal utility district, water control and improvement district, special utility district, water supply corporation, fresh water supply district, or other type of water utility. The TWDB further defines WUGs as one of the following (Texas Water Development Board, 2016b):

- Cities and towns with a population of 500 or more
- Non-city utilities providing more than 280 acre-feet per year per year of water for municipal use
- Collective reporting units (CRUs) consisting of grouped utilities having a common

[1] Equal to 811,224 acre-feet per year in conservation savings.

association

- County-Wide WUGs:
    - County-Other (Rural/unincorporated areas of municipal water use)
    - Manufacturing
    - Steam electric power generation

What is a recommended water management strategy?

A recommended water management strategy (WMS) is a measure that will help ensure WUGs have adequate water supplies for their end users well into the future. WMS examples include river diversions, groundwater use, reservoir and aquifer development, and irrigation conservation. When WMS is referred to in this report, it refers only to municipal conservation, which may include water loss reduction as a part of the same strategy.

What is a WMS supply volume?

A WMS supply volume is the amount of water that a given strategy is expected to yield each decade in the planning period if carried out by the WUG. In this report, a WMS supply volume is the amount of water recommended to come from municipal water conservation.

Some regional water plans separate this strategy's supply volume into a volume for municipal water conservation and a volume for water loss reduction for each decade. The total strategy supply volume is the sum of both. A regional water plan may also refer to "advanced conservation" as part of this strategy. Advanced conservation usually indicates that the volume could be achieved through a more robust mix of conservation activities described in the plan.

2.1 Regional Planning Group Approach to Determining Supply Volumes

Each regional water planning group (RWPG) is responsible for producing its own individual plan that, if executed, will provide sufficient water to its WUGs throughout a 50-year planning period. These plans are completed in five-year cycles, with the most recent edition being completed in 2016. The 2016 regional plans make up the 2017 State Water Plan, which sets out WMS supply volumes for the years 2020 through 2070.

The decadal WMS supply volumes for municipal conservation were established by each of the RWPGs in much the same manner. The RWPGs generally followed the guidelines of the Texas Legislature's Water Conservation Implementation Task Force on the pace utilities should target to reduce gallons per capita per day (GPCD)[2] consumption levels.

[2] Regional water planning GPCD is defined as the annual volume of water pumped, diverted, or purchased minus the volume exported (sold) to other water systems or large industrial facilities divided by the permanent resident population of the Municipal Water User Group in the regional water planning process divided by 365. Saline and reused/recycled water are not included in this volume (Texas Water Development Board, 2012).

The targeted reductions used by most regions follow this formula:

- For municipal WUGs with water use of 140 GPCD and greater, the goal is to reduce per capita water use by one percent per year until the level of 140 GPCD is reached, after which, the goal is to reduce per capita water use by one-fourth percent per year for the remainder of the planning period (Texas Water Development Board, 2016j).

The yearly reductions in GPCD for a given WUG are then converted into recommended supply volumes in acre-feet per year for each decade as the reductions in consumption continue. Some regions reduce GPCD by slightly different percentages before and after the 140 GPCD threshold, some do not apply further reductions in GPCD for WUGs once they reach 140 GPCD, while others recommend only "advanced conservation" activities once WUGs meet 140 GPCD.

2.2 Methodology

In order to complete a uniform quantification process, the first engagement was with utilities that agreed to participate and collected as much relevant data as possible. These data included, among many others, historical GPCD consumption figures, advanced metering infrastructure (AMI) specifications, and detailed feedback on each conservation activity being implemented. Personal interviews focused on determining when and to what extent these activities were being employed, as well as assessing plans to continue such conservation. Examples of frequently implemented activities include tiered water rate conservation pricing, strategic water rate increases, outdoor irrigation audits and ordinances, and rain barrel distribution.

Subsequently, each utility's conservation activities were quantified through several different means, including evidence-based studies, utility field results and savings determinations, manufacturer guarantees, water loss audits, TWDB studies, and other information that assigned a savings value to the activity's implementation.

Every conservation activity studied and quantified has a gallons-per-year estimate, useful life, and decay rate (if applicable) associated with it. Some activities' savings are projected to grow as demand grows over time, while some savings are constant each year and subside once useful life has run its course. For expanded methodology and details on studies and formulas used to determine activity savings, refer to Section 6 of the State Report included as part of this document.

Once analyzed, the resulting savings estimates from each utility were compared with the recommended WMS supply volumes in its respective regional plan to determine if the savings met, exceeded, or fell short of those volumes. Individual utility savings were aggregated to compare with regional volumes, and regional savings were aggregated to compare with state volumes.

It is important to note that this report quantified activity savings—not including water loss reduction—for the WMS supply volume comparison dating back to 2012. The reason for this is, with a few exceptions, the regional planners used 2011 as the base year for establishing potential

WMS supply volumes.[3] In addition, any conservation savings achieved through 2011 are assumed to be accounted for in the regional water planning GPCD for that year.[4] Thus, quantifying from 2012 and forward is the most accurate way to determine if utilities are meeting the recommended conservation volumes in the regional plans. This assumption is by no means 100 percent accurate, however. Some previously implemented activities' savings persist into future years beyond this starting point, while some activities' savings have ceased. One year's GPCD will not necessarily include all savings yielded by conservation activities that came before it, but the quantification assessment must have a starting point.

2.3 Quantifiable Savings

The key to the project being useful and reliable is that the results from year to year are measurable. Quantifying conservation activities that can be accurately measured provides greater certainty and better planning for all stakeholders.

While many utilities are engaged in a variety of conservation activities, not all can currently be properly measured. Some examples of these activities include education initiatives, website and social media engagement, and enforcement for water waste. That does not mean these measures are not essential. Education of consumers, for example, is a fundamental activity that makes all others effective, but little hard data exists to quantify the results of education alone.

In addition, the work of conservation coordinators can have a particularly significant effect on the savings of all other activities, but the specific savings attributed to that staff role is difficult to quantify.

3 Results

This report compares Zapata County Waterworks's current water conservation activities and their quantified savings to two metrics: 1) Region M Water Plan's (Texas Water Development Board, 2016k) recommended WMS supply volumes for municipal conservation, and 2) Zapata County Waterworks's own 5- and 10-year goals as established in its most recent water conservation plan submitted to the TWDB.

The WMS supply volumes for municipal water conservation are laid out by decade (2020 – 2070) in the regional water plans to serve as benchmarks for what each utility could achieve via that strategy during a 50-year planning period.[5]

The 5- and 10-year goals in Zapata County Waterworks's most recent water conservation plan are established by the utility as realistic targets for reducing consumption over that timeframe.

---

[3] Confirmed via personal communication with Region C, H, K, and L Plan consultants.
[4] It was established with TWDB planning staff that 2011 GPCD levels were chosen because they represented the most current water use and conservation patterns at the time.
[5] Some regional water plans separate this strategy volume into a volume for water conservation and a volume for water loss reduction for each decade. The total strategy volume is the sum of both.

These reductions[6] are expressed in decreasing total GPCD [7] consumption and water loss GPCD.[8] [9]

The estimated savings in Tables 3-1 through 3-3 indicate the best information available as provided by utility staff. Some ongoing activities may not be known and are within a utility's service area are implemented on a micro-scale that may not be quantified. Individual households and businesses may be implementing conservation measures that are unknown and therefore cannot be included in the report.

Explanation of approach to assessing water loss reduction savings

Water loss reduction savings are defined as the volume of water participating utilities are realizing from their water loss mitigation efforts. For this report, this value is the difference between each individual utility's baseline[10] for water loss GPCD and its most recent water loss GPCD reported in 2015 water loss audits on file with TWDB. Savings from all water loss reduction efforts—including pipe replacements and leak repair—are assumed to be included in this comparison to a utility's baseline.

Note that because a single year (2015) value was used for comparison, it is possible that the 2015 value could be anomalous due to a number of events that may have occurred that year, such as a water main break, a particularly wet year, or a robust effort by the utility to curtail water loss. This will distort future savings figures that were carried forward in the study because water loss will inevitably increase or decrease in later years.

Ideally, using a rolling five-year average in the calculation would correct such anomalies. However, there was insufficient data to do that for every utility. The approach was to use the most complete water loss data possible, which was represented by the 2015 water loss audit. This problem will be further minimized, as continued data collection will allow five-year averages to be calculated for a majority of utilities.

In this way, water loss savings estimates are different from all other activity savings estimates in the project. Whether savings were positive or negative depended on where individual utilities established their own baselines or where their five-year average started, and what water loss GPCD value was reported in 2015.

---

[6] Occasionally, some utilities expect consumption to increase due to various reasons, such as an incoming industrial presence expected to raise consumption figures for the entire service area.

[7] As defined in TWDB water conservation plan annual report (Texas Water Development Board, 2016o): (Total Gallons in System ÷ Permanent Population) ÷ 365

[8] These plans also have targets for residential GPCD and water loss as a percentage (rather than GPCD), but this report does not address those goals.

[9] As defined in TWDB water conservation plan annual report (Texas Water Development Board, 2016o): (Total Water Loss ÷ Permanent Population) ÷ 365

[10] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.

3.1 Current Savings Compared to Conservation WMS Supply Volume (in million gallons) in Regional Water Plan

Table 3-1 shows the 2070 outlook for Zapata County Waterworks with the utility's yearly recommended WMS supply volume in million gallons (MG) alongside its water savings from implemented activities, including from water loss reduction. These activities and their associated savings are covered in greater detail in Sections 4 and 5.

Starting in 2015, this table compares all quantified conservation activity and the recommended conservation WMS supply volume for the planning period. The following definitions pair with the column headers in Table 3-1.

Actual Current Conservation Activity Savings – All quantified activities currently being performed by the utility, *excluding* savings from water loss reduction. The regional planners used 2011 GPCD as the baseline for determining future conservation WMS supply volumes, therefore the study quantifies utility savings starting in 2012 for this comparison. The summary of these savings can be referenced in Table 5-1.

Actual Water Loss Reduction Savings (as of 2015) – The difference between the baseline[11] for water loss GPCD and most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB. [12] The summary of these savings can be referenced in Table 5-2.

Total Savings from All Conservation Activity – Actual Current Conservation Activity Savings plus Actual Water Loss Reduction Savings (as of 2015).

Conservation WMS Volume – The recommended municipal water conservation supply volume in the regional plan for the decades ranging from 2020 to 2070. These volumes are converted to MG from the values listed in the plan in acre-feet and then calculated in annual increments.

Water Loss Reduction WMS Volume – Some regional water plans have a separate WMS volume for water conservation and for water loss reduction for each decade. If a WUG's regional plan has a WMS volume for water loss reduction, this column will have values other than zero.

Total Yearly WMS Volume – The sum of the Conservation WMS Volume and Water Loss Reduction WMS Volume.

Over (Short) – The amount that the utility's Total Savings from All Conservation Activity (since 2012), is over or below the Total Yearly WMS Volume in the regional water plan. If the amount falls below the WMS volume, it will appear in parentheses.

---

[11] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.

[12] If water loss GPCD has increased from the utility's baseline or historic five-year average to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount.

Table 3-1. Current Savings Compared to Conservation WMS Supply Volume (MG) in Regional Water Plan.

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)

2070	69.4	(19)	50	402	0	402	(351)

3.2 Utility Water Conservation Plan Goals – Total GPCD

Table 3-2 shows how Zapata County Waterworks's quantified savings from its implemented activities compare with 5- 10 year goals established in its individual water conservation plan submitted to the TWDB. The following definitions pair with the column headers in Table 3-2.

Utility Population – Estimated utility service area population for the years indicated.

Total GPCD Goals – Total GPCD goals start with the utility's baseline[13] for total GPCD and progress in subsequent years to match 5- and 10-year goals indicated in a utility's five-year water conservation plan on file with the TWDB. The first five annual GPCD goals were developed by spreading the difference between the baseline and five-year goal evenly over five years. The second five annual GPCD goals spread the difference between the five-year goal and 10-year goal evenly over the next five years.

Annual Savings Goal with Reduction in GPCD (MG) – This column shows what reductions from the baseline GPCD would yield in terms of volume each year as more water is saved. The volumes indicated here are what target GPCD goals look like expressed in million gallons. Annual volumes were derived using the formula: (baseline total GPCD – target total GPCD for that year) x 365 days ÷ 1,000,000 gallons.

Total Savings for All Current Quantified Activities (MG) – Total quantified savings for all current conservation activities and savings from water loss reduction. Refer to Tables 5-1 and 5-2 for details on these savings.

Over (Short) – The amount that the utility's total quantified savings for all current conservation activities (since 2012), including water loss reduction, is over or below the volume represented by reductions in GPCD each year. If the quantified savings are less than these target volumes, the value will appear in parentheses.

Table 3-2. Utility Water Conservation Plan Goals — Total GPCD.

Year #	Year	Utility Population	Total GPCD Goals	Annual Savings Goal with Reduction in GPCD (MG)	Total Savings for All Current Quantified Activities (MG)	Over (Short) (MG)
0	**Baseline**	-	114	0	0	0
1	2015	11,928	115	(3)	17.5	20
2	2016	12,149	115	(5)	34.1	39
3	2017	12,370	116	(8)	34.6	43
4	2018	12,590	116	(11)	35.1	46
5-year Goal	2019	12,811	117	(14)	35.7	50
6	2020	13,032	116	(11)	36.2	48
7	2021	13,256	116	(9)	36.7	45
8	2022	13,480	115	(6)	37.3	43
9	2023	13,704	115	(3)	37.8	41
10-year Goal	2024	13,928	114	0	38.3	38

[13] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for total GPCD from the utility's most recently submitted five-year water conservation plan was used.

3.3 Utility Water Conservation Plan Goals – Water Loss GPCD

Table 3-3 shows how Zapata County Waterworks's most recent water loss audit compares with five- and 10-year water loss goals in its water conservation plan. The following definitions pair with the column headers in Table 3-2.

Utility Population – Estimated utility service area population for the years indicated.

Water Loss GPCD Goals – Water loss GPCD goals start with the utility's baseline[14] for water loss GPCD and progress in subsequent years to match 5- and 10-year water loss goals indicated in a utility's five-year water conservation plan on file with the TWDB. The first five annual GPCD goals were developed by spreading the difference between the baseline and five-year goal evenly over five years. The second five annual GPCD goals spread the difference between the five-year goal and 10-year goal evenly over the next five years.

Yearly Savings Goal with Reduction in GPCD (MG) – This column shows what reductions from the baseline water loss GPCD would yield in terms of volume each year as more water is saved. The volumes indicated here are what target water loss GPCD goals look like expressed in million gallons. Annual volumes were derived using the formula: (baseline water loss GPCD – target water loss GPCD for that year) x 365 days ÷ 1,000,000 gallons.

Total Savings from Water Loss Reduction (MG) – The difference between a utility's established baseline for water loss GPCD and the most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB. If water loss GPCD has increased from the utility's baseline to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount. Reference Table 5-2 for savings from water loss reduction.

Over (Short) – The amount that the utility's total savings from water loss reduction is over or below the volume represented by reductions in GPCD each year. If water loss reduction savings are less than these target volumes, the value will appear in parentheses.

Table 3-3. Utility Water Conservation Plan Goals — Water Loss GPCD.

Year #	Year	Utility Population	Water Loss GPCD Goals	Yearly Savings Goal with Reduction in GPCD (MG)	Total Savings from Water Loss Reduction (MG)	Over (Short) (MG)
0	**Baseline**	-	12.00	0	0	0
1	2015	11,928	12.00	0	(9)	(9)
2	2016	12,149	12.00	0	(9)	(9)
3	2017	12,370	12.00	0	(9)	(9)
4	2018	12,590	12.00	0	(9)	(9)
5-year Goal	2019	12,811	12.00	0	(9)	(9)
6	2020	13,032	11.60	2	(10)	(11)
7	2021	13,256	11.20	4	(10)	(14)
8	2022	13,480	10.80	6	(10)	(16)
9	2023	13,704	10.40	8	(10)	(18)
10-year Goal	2024	13,928	10.00	10	(10)	(20)

[14] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.

4 Implemented Activities

Below is a list of completed activities with estimated water savings. Note that drought response and other measures are not included in the utility's water savings because they are temporary, awareness-based or not able to be accurately quantified on an annual basis.

These are not savings projections of potential future activities. Estimated savings are based on measures that have actually been implemented. If savings are shown to persist in future years, it is because the measure is permanent, such as an ordinance, or the savings are assumed to continue for the reason listed under the itemized activity. Estimated savings from water rate increases are the one exception to these conditions.

Water Rate Increases

Savings from water rate increases were included because entities such as the U.S. Environmental Protection Agency and others indicate specific savings for utilities that raise rates (Texas Water Development Board, 2013; U.S. E.P.A., 1998; Whitcomb, 1999). This project includes surveys of several utilities that have minimal education efforts, perform no other substantive conservation activities, and yet experienced significant demand reduction that coincided with rate increases. In those cases, savings estimates matched up closely with decreases in total GPCD. For many smaller utilities, especially those with customers lacking disposable income, this measure is the only tool used to conserve other than water loss reduction

The following assumptions were made for water rate increases:

- The model assumes that savings persist into future years because it is expected that the utility will continue to make periodic rate increases in line with the percentage increases from previous years.
- Only the last two rate increases for a utility were quantified.
- Savings grow with demand because as new customers enter the service area, they are assumed to adhere to the same price elasticity model estimates.
- A weighted average for savings was used when rate increases differed between residential and industrial-commercial-institutional (ICI) customers based on the individual utility's customer class breakdown.
- When a utility raised rates using tiered rate conservation pricing, a 50/50 savings split was used when increases differed between base and volumetric rates.
    - The reasoning is that all customers must react to the base increase, yet the pricing signal is stronger when volumetric rate increases affect the higher usage customers.
    - The 50/50 split is reasonable because many customers will not reach the higher volumetric tiers.
    - Studies show that most customers do not actually know they have reached the higher volumetric tiers; just that their bill has increased (Texas Water Development Board, 2013).

4.1 Itemized Activities

1. **Utility Website**
   a. Easy-to-use website with conservation tips and water rates
   b. Features contact information for Public Works staff and customer service

2. **Continuing Public Education**
   a. The utility engages the public in many ways including:
      i. Brochures, bill messages, displays, and exhibits

3. **Water Loss Reduction Savings**[15]
   a. Loss of 9 MG annually in 2015
   b. Water loss reduction savings = the difference between a utility's baseline[16] water loss GPCD submitted in its most recent 5-year water conservation plan and its most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB
   c. If water loss GPCD has increased from the utility's baseline or historic 5-year average to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount.
   d. All savings estimates grow each year at the same rate population figures for the utility grow in the regional water plan.

4. **Water Rate Increases**
   a. Last rate increases:[17]
      i. 12.46% increase in 2015
      ii. 11.07% increase in 2016
   b. Estimated customer demand reduction of 4.6%
   c. Savings is cumulative and based on more than one source[18] (U.S. EPA, 1998; Whitcomb, 1999)
   d. Savings from rate increases are shown to persist over time, however, note that savings from these pricing signals will likely decrease if rates remain the same in future years.

[15] If current water loss levels exceed a utility's baseline, this value is treated as a deduction from total quantified savings.
[16] In the absence of having a baseline figure provided in the utility's most recently submitted 5-year water conservation plan, the historic 5-year average for water loss GPCD in the plan was used.
[17] Correspondence with utility staff.
[18] W The study estimates a 2% demand reduction with 10% increase in price on a targeted customer class. By applying a ratio, it is possible to determine the savings for lower or higher percentage increases..

5 Summary of Savings

Table 5-1. Savings by Water Conservation Activity (MG).

Year	Water Rate Increases	TOTAL SAVINGS
2009		0.0
2010		0.0
2011		0.0
2012		0.0
2013		0.0
2014		0.0
2015	17.5	17.5
2016	34.1	34.1
2017	34.6	34.6
2018	35.1	35.1
2019	35.7	35.7
2020	36.2	36.2
2021	36.7	36.7
2022	37.3	37.3
2023	37.8	37.8
2024	38.3	38.3
2025	38.8	38.8
2026	39.4	39.4
2027	39.9	39.9
2028	40.4	40.4
2029	41.0	41.0

6 Suggested Activities

Up to four activities were chosen as potential suggested activities for individual reports. These activities are: AMI system with customer portal, twice-per-week (or less) outdoor watering ordinances, strategic water rate increases, and rain barrels.

Activities were chosen because they are:

- Achievable
- Prevalence of vendors that can actually implement them
- Acceptability to city councils, MUD boards, et al.
- Easily adopted
- Cost effective
- Yield high savings relative to cost

AMI systems with customer engagement portals were also chosen because they represent a profusion of future applications that will undoubtedly continue to advance conservation efforts. AMI and meter data management (MDM) companies are developing new and innovative ways to benefit water providers, customers, and ultimately states that are pushing conservation and usage analytics further.

Each utility should be cognizant of the potential impact that these suggested activities may have on its own unique rate and revenue situation.

Benefits to consider:

- Avoided water supply and wastewater costs
    - The higher water purchase, transmission, and distribution costs are, the greater the potential benefit realized when large amounts of water are conserved with these activities.
- Avoided system expansion costs
    - Conserving water may allow a utility to postpone building new system capacity by decreasing demand even as population grows.

Costs to consider:

- Staff time and resources
- Unit cost per unit saved
- Implementation costs
- Stakeholder agreement and support
- Other overhead and budget considerations

6.1 Suggested Activities with Savings Estimates

1. Twice-a-week Outdoor Watering Restriction Ordinance
   a. Potentially 5.05% savings of total demand (Hermitte and Mace, 2012; Sierra Club-Lone Star Chapter and National Wildlife Federation, 2015)
      i. Average Region M savings
      ii. Specific percentage of outdoor usage unknown for your utility at this time
   b. Savings could be 37 MG per year with current demand.
   c. See Table 6-1 for potential savings from this measure compared with the city's WMS supply volumes targets.

Table 6-1. Current Savings + Potential Savings from 2x per Week Watering Ordinance (MG).

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Potential Savings from Ordinance	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)
2016	34	(9)	25	37	15	0	15	48
2017	35	(9)	26	38	15	0	15	49
2018	35	(9)	26	39	18	0	18	47
2019	36	(9)	26	39	21	0	21	45
2020	36	(10)	27	40	26	0	26	40
2021	37	(10)	27	40	33	0	33	34
2022	37	(10)	27	41	40	0	40	28
2023	38	(10)	28	41	47	0	47	22
2024	38	(10)	28	42	54	0	54	16
2025	39	(10)	29	43	61	0	61	10
2026	39	(10)	29	43	68	0	68	4
2027	40	(11)	29	44	75	0	75	(2)
2028	40	(11)	30	44	82	0	82	(8)
2029	41	(11)	30	45	89	0	89	(14)
2030	41	(11)	30	46	96	0	96	(20)
2031	42	(11)	31	46	102	0	102	(25)
2032	43	(12)	31	47	109	0	109	(31)
2033	43	(12)	32	48	115	0	115	(36)
2034	44	(12)	32	48	121	0	121	(41)
2035	44	(12)	32	49	128	0	128	(47)
2036	45	(12)	33	49	134	0	134	(52)
2037	46	(12)	33	50	141	0	141	(57)
2038	46	(13)	34	51	147	0	147	(63)
2039	47	(13)	34	51	154	0	154	(68)
2040	47	(13)	35	52	160	0	160	(73)

2. Advanced Metering Infrastructure with Customer Engagement Portal

These portals, along with mobile applications and billing statements, can provide customers with much more access to their water use data in simple and compelling formats. This access and comparison with other customers' usage can reduce water use through changed behavior, as well as provide an opportunity for other conservation programs to be offered to the customer for increased adoption and additional savings. AMI systems support leak notification and web portals with real-time data. Any water loss reduction savings that these systems also yield were included in the water loss assessment of individual reports for this project.

- **a.** Specific utility results will vary based on portal features and frequency of customer notifications
- **b.** Potential savings estimate assumes 20% of residential customers will use and save water due to the portal (Westin Engineering, 2015)
- **c.** Estimate assumes customers will save 10% of total annual use due to the portal
    - i. Savings estimate of 10% is an average of results from multiple studies (Chesnutt and Mitchell, 2013; East Bay Municipal Utility District, 2014; IBM, 2011; Texas A&M and Texas Water Resources Institute, 2016; Westin Engineering, 2015)
- **d.** Residential customers' use assumed to make up approximately 67% of all retail customers' use based on utility profile information submitted to the TWDB
    - i. This was the most common percentage of residential use among participating utilities in this project.
    - ii. Actual customer class demand percentages will vary by utility.
- **e.** 20% of residential customers saving 10% with this customer class breakdown amounts to 1.34% of total demand
- **f.** Savings are assumed to increase along with demand as connections increase each year[19]
- **g.** See Table 6-2 for potential savings from this measure compared with the utility's WMS supply volumes targets.

[19] The 10% consumption reduction figure for 20% of residential customers is conservative, but savings could be greater when monitored yearly as customer engagement increases.

Table 6-2. Current Savings + Potential Savings from AMI with Customer Portal (MG).

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Potential Savings from AMI with Customer Portal	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)
2016	34	(9)	25	10	15	0	15	20
2017	35	(9)	26	10	15	0	15	21
2018	35	(9)	26	10	18	0	18	19
2019	36	(9)	26	10	21	0	21	16
2020	36	(10)	27	11	26	0	26	11
2021	37	(10)	27	11	33	0	33	4
2022	37	(10)	27	11	40	0	40	(2)
2023	38	(10)	28	11	47	0	47	(8)
2024	38	(10)	28	11	54	0	54	(15)
2025	39	(10)	29	11	61	0	61	(21)
2026	39	(10)	29	11	68	0	68	(28)
2027	40	(11)	29	12	75	0	75	(34)
2028	40	(11)	30	12	82	0	82	(41)
2029	41	(11)	30	12	89	0	89	(47)
2030	41	(11)	30	12	96	0	96	(53)
2031	42	(11)	31	12	102	0	102	(59)
2032	43	(12)	31	12	109	0	109	(65)
2033	43	(12)	32	13	115	0	115	(71)
2034	44	(12)	32	13	121	0	121	(77)
2035	44	(12)	32	13	128	0	128	(83)
2036	45	(12)	33	13	134	0	134	(88)
2037	46	(12)	33	13	141	0	141	(94)
2038	46	(13)	34	13	147	0	147	(100)
2039	47	(13)	34	14	154	0	154	(106)
2040	47	(13)	35	14	160	0	160	(112)

3. Rain Barrels
   a. In Region M, utilities could save approximately 13.1 gallons per year per gallon of capacity rebated, sold, or distributed (GDS Associates, 2002).
   b. Estimated 10-year useful life for most barrels

Region N Individual Reports

Statewide Water Conservation Quantification Project
Nueces County WCID #3 Report • 2017

1 Introduction

In Texas' 2017 State Water Plan, municipal water conservation is projected to meet 9.6 percent[1] of the state's future water needs by 2070. According to the 16 regional water plans that comprise the state water plan, this is expected to be achieved through a variety of measures such as installation of water efficient plumbing fixtures, water conservation pricing structures, water system audits, landscape irrigation ordinances, as well as other water conservation activities. The 9.6 percent is "in addition to the estimated share of future passive conservation savings from plumbing codes and water efficiency standards, which are embedded in municipal water demand projections" (Texas Water Development Board, 2017).

In 2015, the Texas Legislature appropriated funds to the Texas Water Development Board (TWDB) to fund a research project principally charged with quantitatively determining the savings of municipal water conservation activities being implemented in relation to the recommended conservation goals (supply volumes) in the State Water Plan. As part of the project, individual reports were completed for all participating utilities.

With this report, utilities will benefit by receiving a clear and concise picture of its water conservation goals alongside estimated savings from quantifiable activities. In the event that current activity savings may not be able to reach long-term goals, this report offers suggestions on how utilities can reach water conservation goals with activities that are effective, easily adopted, have widespread appeal, and are quantifiable.

2 Municipal Conservation Terminology and Review of Methodology Used by Regional Planners

To make use of the results of this study, it is important to understand several key terms used in the water planning process.

What is a water user group?

In this report, a water user group (WUG) refers to a retail water provider in the form a city, municipal utility district, water control and improvement district, special utility district, water supply corporation, fresh water supply district, or other type of water utility. The TWDB further defines WUGs as one of the following (Texas Water Development Board, 2016b):

- Cities and towns with a population of 500 or more
- Non-city utilities providing more than 280 acre-feet per year per year of water for municipal use
- Collective reporting units (CRUs) consisting of grouped utilities having a common

[1] Equal to 811,224 acre-feet per year in conservation savings.

association

- County-Wide WUGs:
    - County-Other (Rural/unincorporated areas of municipal water use)
    - Manufacturing
    - Steam electric power generation

What is a recommended water management strategy?

A recommended water management strategy (WMS) is a measure that will help ensure WUGs have adequate water supplies for their end users well into the future. WMS examples include river diversions, groundwater use, reservoir and aquifer development, and irrigation conservation. When WMS is referred to in this report, it refers only to municipal conservation, which may include water loss reduction as a part of the same strategy.

What is a WMS supply volume?

A WMS supply volume is the amount of water that a given strategy is expected to yield each decade in the planning period if carried out by the WUG. In this report, a WMS supply volume is the amount of water recommended to come from municipal water conservation.

Some regional water plans separate this strategy's supply volume into a volume for municipal water conservation and a volume for water loss reduction for each decade. The total strategy supply volume is the sum of both. A regional water plan may also refer to "advanced conservation" as part of this strategy. Advanced conservation usually indicates that the volume could be achieved through a more robust mix of conservation activities described in the plan.

2.1 Regional Planning Group Approach to Determining Supply Volumes

Each regional water planning group (RWPG) is responsible for producing its own individual plan that, if executed, will provide sufficient water to its WUGs throughout a 50-year planning period. These plans are completed in five-year cycles, with the most recent edition being completed in 2016. The 2016 regional plans make up the 2017 State Water Plan, which sets out WMS supply volumes for the years 2020 through 2070.

The decadal WMS supply volumes for municipal conservation were established by each of the RWPGs in much the same manner. The RWPGs generally followed the guidelines of the Texas Legislature's Water Conservation Implementation Task Force on the pace utilities should target to reduce gallons per capita per day (GPCD)[2] consumption levels.

The targeted reductions used by most regions follow this formula:

[2] Regional water planning GPCD is defined as the annual volume of water pumped, diverted, or purchased minus the volume exported (sold) to other water systems or large industrial facilities divided by the permanent resident population of the Municipal Water User Group in the regional water planning process divided by 365. Saline and reused/recycled water are not included in this volume (Texas Water Development Board, 2012).

- For municipal WUGs with water use of 140 GPCD and greater, the goal is to reduce per capita water use by one percent per year until the level of 140 GPCD is reached, after which, the goal is to reduce per capita water use by one-fourth percent per year for the remainder of the planning period (Texas Water Development Board, 2016j).

The yearly reductions in GPCD for a given WUG are then converted into recommended supply volumes in acre-feet per year for each decade as the reductions in consumption continue. Some regions reduce GPCD by slightly different percentages before and after the 140 GPCD threshold, some do not apply further reductions in GPCD for WUGs once they reach 140 GPCD, while others recommend only "advanced conservation" activities once WUGs meet 140 GPCD.

2.2 Methodology

In order to complete a uniform quantification process, the first engagement was with utilities that agreed to participate and collected as much relevant data as possible. These data included, among many others, historical GPCD consumption figures, advanced metering infrastructure (AMI) specifications, and detailed feedback on each conservation activity being implemented. Personal interviews focused on determining when and to what extent these activities were being employed, as well as assessing plans to continue such conservation. Examples of frequently implemented activities include tiered water rate conservation pricing, strategic water rate increases, outdoor irrigation audits and ordinances, and rain barrel distribution.

Subsequently, each utility's conservation activities were quantified through several different means, including evidence-based studies, utility field results and savings determinations, manufacturer guarantees, water loss audits, TWDB studies, and other information that assigned a savings value to the activity's implementation.

Every conservation activity studied and quantified has a gallons-per-year estimate, useful life, and decay rate (if applicable) associated with it. Some activities' savings are projected to grow as demand grows over time, while some savings are constant each year and subside once useful life has run its course. For expanded methodology and details on studies and formulas used to determine activity savings, refer to Section 6 of the State Report included as part of this document.

Once analyzed, the resulting savings estimates from each utility were compared with the recommended WMS supply volumes in its respective regional plan to determine if the savings met, exceeded, or fell short of those volumes. Individual utility savings were aggregated to compare with regional volumes, and regional savings were aggregated to compare with state volumes.

It is important to note that this report quantified activity savings—not including water loss reduction—for the WMS supply volume comparison dating back to 2012. The reason for this is, with a few exceptions, the regional planners used 2011 as the base year for establishing potential WMS supply volumes.[3] In addition, any conservation savings achieved through 2011 are

[3] Confirmed via personal communication with Region C, H, K, and L Plan consultants.

assumed to be accounted for in the regional water planning GPCD for that year.[4] Thus, quantifying from 2012 and forward is the most accurate way to determine if utilities are meeting the recommended conservation volumes in the regional plans. This assumption is by no means 100 percent accurate, however. Some previously implemented activities' savings persist into future years beyond this starting point, while some activities' savings have ceased. One year's GPCD will not necessarily include all savings yielded by conservation activities that came before it, but the quantification assessment must have a starting point.

2.3 Quantifiable Savings

The key to the project being useful and reliable is that the results from year to year are measurable. Quantifying conservation activities that can be accurately measured provides greater certainty and better planning for all stakeholders.

While many utilities are engaged in a variety of conservation activities, not all can currently be properly measured. Some examples of these activities include education initiatives, website and social media engagement, and enforcement for water waste. That does not mean these measures are not essential. Education of consumers, for example, is a fundamental activity that makes all others effective, but little hard data exists to quantify the results of education alone.

In addition, the work of conservation coordinators can have a particularly significant effect on the savings of all other activities, but the specific savings attributed to that staff role is difficult to quantify.

3 Results

This report compares Nueces County WCID #3's current water conservation activities and their quantified savings to two metrics: 1) Region N Water Plan's (Texas Water Development Board, 2016l) recommended WMS supply volumes for municipal conservation, and 2) Nueces County WCID #3's own five- and 10-year goals as established in its most recent water conservation plan submitted to the TWDB.

The WMS supply volumes for municipal water conservation are laid out by decade (2020 – 2070) in the regional water plans to serve as benchmarks for what each utility could achieve via that strategy during a 50-year planning period.[5]

The 5- and 10-year goals in Nueces County WCID #3's most recent water conservation plan are established by the utility as realistic targets for reducing consumption over that timeframe.

These reductions[6] are expressed in decreasing total GPCD[7] consumption and water loss GPCD.[8]

---

[4] It was established with TWDB planning staff that 2011 GPCD levels were chosen because they represented the most current water use and conservation patterns at the time.
[5] Some regional water plans separate this strategy volume into a volume for water conservation and a volume for water loss reduction for each decade. The total strategy volume is the sum of both.
[6] Occasionally, some utilities expect consumption to increase due to various reasons, such as an incoming industrial presence expected to raise consumption figures for the entire service area.
[7] As defined in TWDB water conservation plan annual report (Texas Water Development Board, 2016o): (Total Gallons in System ÷ Permanent Population) ÷ 365

9

The estimated savings in Tables 3-1 through 3-3 indicate the best information available as provided by utility staff. Some ongoing activities may not be known and are within a utility's service area are implemented on a micro-scale that may not be quantified. Individual households and businesses may be implementing conservation measures that are unknown and therefore cannot be included in the report.

Explanation of approach to assessing water loss reduction savings

Water loss reduction savings are defined as the volume of water participating utilities are realizing from their water loss mitigation efforts. For this report, this value is the difference between each individual utility's baseline[10] for water loss GPCD and its most recent water loss GPCD reported in 2015 water loss audits on file with TWDB. Savings from all water loss reduction efforts—including pipe replacements and leak repair—are assumed to be included in this comparison to a utility's baseline.

Note that because a single year (2015) value was used for comparison, it is possible that the 2015 value could be anomalous due to a number of events that may have occurred that year, such as a water main break, a particularly wet year, or a robust effort by the utility to curtail water loss. This will distort future savings figures that were carried forward in the study because water loss will inevitably increase or decrease in later years.

Ideally, using a rolling five-year average in the calculation would correct such anomalies. However, there was insufficient data to do that for every utility. The approach was to use the most complete water loss data possible, which was represented by the 2015 water loss audit. This problem will be further minimized, as continued data collection will allow five-year averages to be calculated for a majority of utilities.

In this way, water loss savings estimates are different from all other activity savings estimates in the project. Whether savings were positive or negative depended on where individual utilities established their own baselines or where their five-year average started, and what water loss GPCD value was reported in 2015.

---

[8] These plans also have targets for residential GPCD and water loss as a percentage (rather than GPCD), but this report does not address those goals.
[9] As defined in TWDB water conservation plan annual report (Texas Water Development Board, 2016o): (Total Water Loss ÷ Permanent Population) ÷ 365
[10] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.

3.1 Current Savings Compared to Conservation WMS Supply Volume (in million gallons) in Regional Water Plan

Table 3-1 shows the 2070 outlook for Nueces County WCID #3 with the utility's yearly recommended WMS supply volume in million gallons (MG) alongside its water savings from implemented activities, including from water loss reduction. These activities and their associated savings are covered in greater detail in Sections 4 and 5.

Starting in 2015, this table compares all quantified conservation activity and the recommended conservation WMS supply volume for the planning period. The following definitions pair with the column headers in Table 3-1.

Actual Current Conservation Activity Savings – All quantified activities currently being performed by the utility, *excluding* savings from water loss reduction. The regional planners used 2011 GPCD as the baseline for determining future conservation WMS supply volumes, therefore the study quantifies utility savings starting in 2012 for this comparison.

Actual Water Loss Reduction Savings (as of 2015) – The difference between the baseline[11] for water loss GPCD and most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB. [12] The summary of these savings can be referenced in Table 5-1.

Total Savings from All Conservation Activity – Actual Current Conservation Activity Savings plus Actual Water Loss Reduction Savings (as of 2015).

Conservation WMS Volume – The recommended municipal water conservation supply volume in the regional plan for the decades ranging from 2020 to 2070. These volumes are converted to MG from the values listed in the plan in acre-feet and then calculated in annual increments.

Water Loss Reduction WMS Volume – Some regional water plans have a separate WMS volume for water conservation and for water loss reduction for each decade. If a WUG's regional plan has a WMS volume for water loss reduction, this column will have values other than zero.

Total Yearly WMS Volume – The sum of the Conservation WMS Volume and Water Loss Reduction WMS Volume.

Over (Short) – The amount that the utility's Total Savings from All Conservation Activity (since 2012), is over or below the Total Yearly WMS Volume in the regional water plan. If the amount falls below the WMS volume, it will appear in parentheses.

[11] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.

[12] If water loss GPCD has increased from the utility's baseline or historic five-year average to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount.

Table 3-1. Current Savings Compared to Conservation WMS Supply Volume (MG) in Regional Water Plan.

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)
2015	0	26	26	18	0	18	8

3.2 Utility Water Conservation Plan Goals – Total GPCD

Table 3-2 shows how Nueces County WCID #3's quantified savings from its implemented activities compare with 5- 10 year goals established in its individual water conservation plan submitted to the TWDB. The following definitions pair with the column headers in Table 3-2.

Utility Population – Estimated utility service area population for the years indicated.

Total GPCD Goals – Total GPCD goals start with the utility's baseline[13] for total GPCD and progress in subsequent years to match 5- and 10-year goals indicated in a utility's five-year water conservation plan on file with the TWDB. The first five annual GPCD goals were developed by spreading the difference between the baseline and five-year goal evenly over five years. The second five annual GPCD goals spread the difference between the five-year goal and 10-year goal evenly over the next five years.

Annual Savings Goal with Reduction in GPCD (MG) – This column shows what reductions from the baseline GPCD would yield in terms of volume each year as more water is saved. The volumes indicated here are what target GPCD goals look like expressed in million gallons. Annual volumes were derived using the formula: (baseline total GPCD – target total GPCD for that year) x 365 days ÷ 1,000,000 gallons.

Total Savings for All Current Quantified Activities (MG) – Total quantified savings for all current conservation activities and savings from water loss reduction.

Over (Short) – The amount that the utility's total quantified savings for all current conservation activities (since 2012), including water loss reduction, is over or below the volume represented by reductions in GPCD each year. If the quantified savings are less than these target volumes, the value will appear in parentheses.

Table 3-2. Utility Water Conservation Plan Goals — Total GPCD.

Year #	Year	Utility Population	Total GPCD Goals	Annual Savings Goal with Reduction in GPCD (MG)	Total Savings for All Current Quantified Activities (MG)	Over (Short) (MG)
0	**Baseline**	-	112	0	0	0
1	2015	11,800	112	1	26	25
2	2016	11,933	112	2	26	24
3	2017	12,067	111	3	26	24
4	2018	12,200	111	4	27	23
5-year Goal	2019	12,334	111	5	27	23
6	2020	12,467	111	6	27	21
7	2021	12,467	110	8	27	19
8	2022	12,468	110	10	27	17
9	2023	12,468	109	12	27	15
10-year Goal	2024	12,468	109	14	27	14

[13] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for total GPCD from the utility's most recently submitted five-year water conservation plan was used.

3.3 Utility Water Conservation Plan Goals – Water Loss GPCD

Table 3-3 shows how Nueces County WCID #3's most recent water loss audit compares with 5- and 10-year water loss goals in its water conservation plan. The following definitions pair with the column headers in Table 3-2.

Utility Population – Estimated utility service area population for the years indicated.

Water Loss GPCD Goals – Water loss GPCD goals start with the utility's baseline[14] for water loss GPCD and progress in subsequent years to match 5- and 10-year water loss goals indicated in a utility's five-year water conservation plan on file with the TWDB. The first five annual GPCD goals were developed by spreading the difference between the baseline and five-year goal evenly over five years. The second five annual GPCD goals spread the difference between the five-year goal and 10-year goal evenly over the next five years.

Yearly Savings Goal with Reduction in GPCD (MG) – This column shows what reductions from the baseline water loss GPCD would yield in terms of volume each year as more water is saved. The volumes indicated here are what target water loss GPCD goals look like expressed in million gallons. Annual volumes were derived using the formula: (baseline water loss GPCD – target water loss GPCD for that year) x 365 days ÷ 1,000,000 gallons.

Total Savings from Water Loss Reduction (MG) – The difference between a utility's established baseline for water loss GPCD and the most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB. If water loss GPCD has increased from the utility's baseline to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount. Reference Table 5-1 for savings from water loss reduction.

Over (Short) – The amount that the utility's total savings from water loss reduction is over or below the volume represented by reductions in GPCD each year. If water loss reduction savings are less than these target volumes, the value will appear in parentheses.

Table 3-3. Utility Water Conservation Plan Goals — Water Loss GPCD.

Year #	Year	Utility Population	Water Loss GPCD Goals	Yearly Savings Goal with Reduction in GPCD (MG)	Total Savings from Water Loss Reduction (MG)	Over (Short) (MG)
0	**Baseline**	-	20.00	0	0	0
1	2015	11,800	19.80	1	21	20
2	2016	11,933	19.60	2	21	20
3	2017	12,067	19.40	3	22	19
4	2018	12,200	19.20	4	23	19
5-year Goal	2019	12,334	19.00	5	24	19
6	2020	12,467	18.20	8	26	18
7	2021	12,467	17.40	12	29	17
8	2022	12,468	16.60	15	32	17
9	2023	12,468	15.80	19	35	16
10-year Goal	2024	12,468	15.00	23	38	15

[14] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.

4 Implemented Activities

Below is a list of completed activities with estimated water savings. Note that drought response and other measures are not included in the utility's water savings because they are temporary, awareness-based or not able to be accurately quantified on an annual basis.

These are not savings projections of potential future activities. Estimated savings are based on measures that have actually been implemented. If savings are shown to persist in future years, it is because the measure is permanent, such as an ordinance, or the savings are assumed to continue for the reason listed under the itemized activity. Estimated savings from water rate increases are the one exception to these conditions.

Water Rate Increases

Savings from water rate increases were included because entities such as the U.S. Environmental Protection Agency and others indicate specific savings for utilities that raise rates (Texas Water Development Board, 2013; U.S. E.P.A., 1998; Whitcomb, 1999). This project includes surveys of several utilities that have minimal education efforts, perform no other substantive conservation activities, and yet experienced significant demand reduction that coincided with rate increases. In those cases, savings estimates matched up closely with decreases in total GPCD. For many smaller utilities, especially those with customers lacking disposable income, this measure is the only tool used to conserve other than water loss reduction.

The following assumptions were made for water rate increases:

- The model assumes that savings persist into future years because it is expected that the utility will continue to make periodic rate increases in line with the percentage increases from previous years.
- Only the last two rate increases for a utility were quantified.
- Savings grow with demand because as new customers enter the service area, they are assumed to adhere to the same price elasticity model estimates.
- A weighted average for savings was used when rate increases differed between residential and industrial-commercial-institutional (ICI) customers based on the individual utility's customer class breakdown.
- When a utility raised rates using tiered rate conservation pricing, a 50/50 savings split was used when increases differed between base and volumetric rates.
    - The reasoning is that all customers must react to the base increase, yet the pricing signal is stronger when volumetric rate increases affect the higher usage customers.
    - The 50/50 split is reasonable because many customers will not reach the higher volumetric tiers.
    - Studies show that most customers do not actually know they have reached the higher volumetric tiers; just that their bill has increased (Texas Water Development Board, 2013).

4.1 Itemized Activities

1. **Utility Website**
   a. Easy-to-use website with conservation tips and water rates
   b. Features contact information for Public Works staff and customer service

2. **Continuing Public Education**
   a. The utility engages the public in many ways including:
      i. Brochures, bill messages, displays, and exhibits

3. **Water Loss Reduction Savings**[15]
   a. Savings of 26 MG annually in 2015
   b. Water loss reduction savings = the difference between a utility's baseline[16] water loss GPCD submitted in its most recent 5-year water conservation plan and its most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB
   c. If water loss GPCD has increased from the utility's baseline or historic 5-year average to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount.
   d. All savings estimates grow each year at the same rate population figures for the utility grow in the regional water plan.

5 Summary of Savings

Table 5-1. Savings from Water Loss Reduction (MG).

Year	Utility Population	Water Loss GPCD	Total Savings from Water Loss Reduction (MG)
Baseline	-	20.00	0
2015	11,800	14.00	26
2016	11,933	14.00	26
2017	12,067	14.00	26
2018	12,200	14.00	27
2019	12,334	14.00	27
2020	12,467	14.00	27
2021	12,467	14.00	27
2022	12,468	14.00	27
2023	12,468	14.00	27
2024	12,468	14.00	27

---

[15] If current water loss levels exceed a utility's baseline, this value is treated as a deduction from total quantified savings.
[16] In the absence of having a baseline figure provided in the utility's most recently submitted 5-year water conservation plan, the historic 5-year average for water loss GPCD in the plan was used.

6 Suggested Activities

Up to four activities were chosen as potential suggested activities for individual reports. These activities are: AMI system with customer portal, twice-per-week (or less) outdoor watering ordinances, strategic water rate increases, and rain barrels.

Activities were chosen because they are:

- Achievable
- Prevalence of vendors that can actually implement them
- Acceptability to city councils, MUD boards, et al.
- Easily adopted
- Cost effective
- Yield high savings relative to cost

AMI systems with customer engagement portals were also chosen because they represent a profusion of future applications that will undoubtedly continue to advance conservation efforts. AMI and meter data management (MDM) companies are developing new and innovative ways to benefit water providers, customers, and ultimately states that are pushing conservation and usage analytics further.

Each utility should be cognizant of the potential impact that these suggested activities may have on its own unique rate and revenue situation.

Benefits to consider:

- Avoided water supply and wastewater costs
    - The higher water purchase, transmission, and distribution costs are, the greater the potential benefit realized when large amounts of water are conserved with these activities.
- Avoided system expansion costs
    - Conserving water may allow a utility to postpone building new system capacity by decreasing demand even as population grows.

Costs to consider:

- Staff time and resources
- Unit cost per unit saved
- Implementation costs
- Stakeholder agreement and support
- Other overhead and budget considerations

6.1 Suggested Activities with Savings Estimates

1. Advanced Metering Infrastructure with Customer Engagement Portal

These portals, along with mobile applications and billing statements, can provide customers with much more access to their water use data in simple and compelling formats. This access and comparison with other customers' usage can reduce water use through changed behavior, as well as provide an opportunity for other conservation programs to be offered to the customer for increased adoption and additional savings. AMI systems support leak notification and web portals with real-time data. Any water loss reduction savings that these systems also yield were included in the water loss assessment of individual reports for this project.

- **a.** Specific utility results will vary based on portal features and frequency of customer notifications
- **b.** Potential savings estimate assumes 20% of residential customers will use and save water due to the portal (Westin Engineering, 2015)
- **c.** Estimate assumes customers will save 10% of total annual use due to the portal
  - i. Savings estimate of 10% is an average of results from multiple studies (Chesnutt and Mitchell, 2013; East Bay Municipal Utility District, 2014; IBM, 2011; Texas A&M and Texas Water Resources Institute, 2016; Westin Engineering, 2015)
- **d.** Residential customers' use assumed to make up approximately 67% of all retail customers' use based on utility profile information submitted to the TWDB
  - i. This was the most common percentage of residential use among participating utilities in this project.
  - ii. Actual customer class demand percentages will vary by utility.
- **e.** 20% of residential customers saving 10% with this customer class breakdown amounts to 1.34% of total demand
- **f.** Savings are assumed to increase along with demand as connections increase each year[17]
- **g.** See Table 6-1 for potential savings from this measure compared with the utility's WMS supply volumes targets.

[17] The 10% consumption reduction figure for 20% of residential customers is conservative, but savings could be greater when monitored yearly as customer engagement increases.

Table 6-1. Current Savings + Potential Savings from AMI with Customer Portal (MG).

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Potential Savings from AMI with Customer Portal	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)

2. Water Rate Increase
    a. For every 10% increase, estimated savings could be 2% of utility total demand.
    b. Approximately 19 MG of savings per year with current demand
    c. Savings is cumulative and based on more than one source[18] (U.S. EPA, 1998; Whitcomb, 1999)
    d. See Table 6-2 for potential savings from this measure compared with the utility's conservation goals.

[18] The study estimates a 2% demand reduction with 10% increase in price on a targeted customer class. By applying a ratio, it is possible to determine the savings for lower or higher percentage increases.

Table 6-2. Current Savings + Potential Savings from 10% Water Rate Increase (MG).

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Potential Savings from Water Rate Increase	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)

3. Rain Barrels
   a. In Region N, utilities could save approximately 16 gallons per year per gallon of capacity rebated, sold, or distributed (GDS Associates, 2002).
   b. Estimated 10-year useful life for most barrels

TWDB Statewide Water Conservation Quantification Project
City of Corpus Christi Report • 2017

1 Introduction

In Texas' 2017 State Water Plan, municipal water conservation is projected to meet 9.6 percent[1] of the state's future water needs by 2070. According to the 16 regional water plans that comprise the state water plan, this is expected to be achieved through a variety of measures such as installation of water efficient plumbing fixtures, water conservation pricing structures, water system audits, landscape irrigation ordinances, as well as other water conservation activities. The 9.6 percent is "in addition to the estimated share of future passive conservation savings from plumbing codes and water efficiency standards, which are embedded in municipal water demand projections" (Texas Water Development Board, 2017).

In 2015, the Texas Legislature appropriated funds to the Texas Water Development Board (TWDB) to fund a research project principally charged with quantitatively determining the savings of municipal water conservation activities being implemented in relation to the recommended conservation goals (supply volumes) in the State Water Plan. As part of the project, individual reports were completed for all participating utilities.

With this report, utilities will benefit by receiving a clear and concise picture of its water conservation goals alongside estimated savings from quantifiable activities. In the event that current activity savings may not be able to reach long-term goals, this report offers suggestions on how utilities can reach water conservation goals with activities that are effective, easily adopted, have widespread appeal, and are quantifiable.

2 Municipal Conservation Terminology and Review of Methodology Used by Regional Planners

To make use of the results of this study, it is important to understand several key terms used in the water planning process.

What is a water user group?

In this report, a water user group (WUG) refers to a retail water provider in the form a city, municipal utility district, water control and improvement district, special utility district, water supply corporation, fresh water supply district, or other type of water utility. The TWDB further defines WUGs as one of the following (Texas Water Development Board, 2016b):

- Cities and towns with a population of 500 or more
- Non-city utilities providing more than 280 acre-feet per year per year of water for municipal use
- Collective reporting units (CRUs) consisting of grouped utilities having a common association

[1] Equal to 811,224 acre-feet per year in conservation savings.

- County-Wide WUGs:
  - County-Other (Rural/unincorporated areas of municipal water use)
  - Manufacturing
  - Steam electric power generation

What is a recommended water management strategy?

A recommended water management strategy (WMS) is a measure that will help ensure WUGs have adequate water supplies for their end users well into the future. WMS examples include river diversions, groundwater use, reservoir and aquifer development, and irrigation conservation. When WMS is referred to in this report, it refers only to municipal conservation, which may include water loss reduction as a part of the same strategy.

What is a WMS supply volume?

A WMS supply volume is the amount of water that a given strategy is expected to yield each decade in the planning period if carried out by the WUG. In this report, a WMS supply volume is the amount of water recommended to come from municipal water conservation.

Some regional water plans separate this strategy's supply volume into a volume for municipal water conservation and a volume for water loss reduction for each decade. The total strategy supply volume is the sum of both. A regional water plan may also refer to "advanced conservation" as part of this strategy. Advanced conservation usually indicates that the volume could be achieved through a more robust mix of conservation activities described in the plan.

2.1 Regional Planning Group Approach to Determining Supply Volumes

Each regional water planning group (RWPG) is responsible for producing its own individual plan that, if executed, will provide sufficient water to its WUGs throughout a 50-year planning period. These plans are completed in five-year cycles, with the most recent edition being completed in 2016. The 2016 regional plans make up the 2017 State Water Plan, which sets out WMS supply volumes for the years 2020 through 2070.

The decadal WMS supply volumes for municipal conservation were established by each of the RWPGs in much the same manner. The RWPGs generally followed the guidelines of the Texas Legislature's Water Conservation Implementation Task Force on the pace utilities should target to reduce gallons per capita per day (GPCD)[2] consumption levels.

The targeted reductions used by most regions follow this formula:

- For municipal WUGs with water use of 140 GPCD and greater, the goal is to reduce per capita water use by one percent per year until the level of 140 GPCD is reached,

[2] Regional water planning GPCD is defined as the annual volume of water pumped, diverted, or purchased minus the volume exported (sold) to other water systems or large industrial facilities divided by the permanent resident population of the Municipal Water User Group in the regional water planning process divided by 365. Saline and reused/recycled water are not included in this volume (Texas Water Development Board, 2012).

after which, the goal is to reduce per capita water use by one-fourth percent per year for the remainder of the planning period (Texas Water Development Board, 2016j).

The yearly reductions in GPCD for a given WUG are then converted into recommended supply volumes in acre-feet per year for each decade as the reductions in consumption continue. Some regions reduce GPCD by slightly different percentages before and after the 140 GPCD threshold, some do not apply further reductions in GPCD for WUGs once they reach 140 GPCD, while others recommend only "advanced conservation" activities once WUGs meet 140 GPCD.

2.2 Methodology

In order to complete a uniform quantification process, the first engagement was with utilities that agreed to participate and collected as much relevant data as possible. These data included, among many others, historical GPCD consumption figures, advanced metering infrastructure (AMI) specifications, and detailed feedback on each conservation activity being implemented. Personal interviews focused on determining when and to what extent these activities were being employed, as well as assessing plans to continue such conservation. Examples of frequently implemented activities include tiered water rate conservation pricing, strategic water rate increases, outdoor irrigation audits and ordinances, and rain barrel distribution.

Subsequently, each utility's conservation activities were quantified through several different means, including evidence-based studies, utility field results and savings determinations, manufacturer guarantees, water loss audits, TWDB studies, and other information that assigned a savings value to the activity's implementation.

Every conservation activity studied and quantified has a gallons-per-year estimate, useful life, and decay rate (if applicable) associated with it. Some activities' savings are projected to grow as demand grows over time, while some savings are constant each year and subside once useful life has run its course. For expanded methodology and details on studies and formulas used to determine activity savings, refer to Section 6 of the State Report included as part of this document.

Once analyzed, the resulting savings estimates from each utility were compared with the recommended WMS supply volumes in its respective regional plan to determine if the savings met, exceeded, or fell short of those volumes. Individual utility savings were aggregated to compare with regional volumes, and regional savings were aggregated to compare with state volumes.

It is important to note that this report quantified activity savings—not including water loss reduction—for the WMS supply volume comparison dating back to 2012. The reason for this is, with a few exceptions, the regional planners used 2011 as the base year for establishing potential WMS supply volumes.[3] In addition, any conservation savings achieved through 2011 are assumed to be accounted for in the regional water planning GPCD for that year.[4] Thus, quantifying from 2012 and forward is the most accurate way to determine if utilities are meeting

[3] Confirmed via personal communication with Region C, H, K, and L Plan consultants.
[4] It was established with TWDB planning staff that 2011 GPCD levels were chosen because they represented the most current water use and conservation patterns at the time.

the recommended conservation volumes in the regional plans. This assumption is by no means 100 percent accurate, however. Some previously implemented activities' savings persist into future years beyond this starting point, while some activities' savings have ceased. One year's GPCD will not necessarily include all savings yielded by conservation activities that came before it, but the quantification assessment must have a starting point.

2.3 Quantifiable Savings

The key to the project being useful and reliable is that the results from year to year are measurable. Quantifying conservation activities that can be accurately measured provides greater certainty and better planning for all stakeholders.

While many utilities are engaged in a variety of conservation activities, not all can currently be properly measured. Some examples of these activities include education initiatives, website and social media engagement, and enforcement for water waste. That does not mean these measures are not essential. Education of consumers, for example, is a fundamental activity that makes all others effective, but little hard data exists to quantify the results of education alone.

In addition, the work of conservation coordinators can have a particularly significant effect on the savings of all other activities, but the specific savings attributed to that staff role is difficult to quantify.

3 Results

This report compares Corpus Christi's current water conservation activities and their quantified savings to two metrics: 1) Region N Water Plan's (Texas Water Development Board, 2016l) recommended WMS supply volumes for municipal conservation, and 2) Corpus Christi's own 5- and 10-year goals as established in its most recent water conservation plan submitted to the TWDB.

The WMS supply volumes for municipal water conservation are laid out by decade (2020 – 2070) in the regional water plans to serve as benchmarks for what each utility could achieve via that strategy during a 50-year planning period.[5]

The 5- and 10-year goals in Corpus Christi's most recent water conservation plan are established by the utility as realistic targets for reducing consumption over that timeframe. These reductions[6] are expressed in decreasing total GPCD [7] consumption and water loss GPCD.[8] [9]

---

[5] Some regional water plans separate this strategy volume into a volume for water conservation and a volume for water loss reduction for each decade. The total strategy volume is the sum of both.

[6] Occasionally, some utilities expect consumption to increase due to various reasons, such as an incoming industrial presence expected to raise consumption figures for the entire service area.

[7] As defined in TWDB water conservation plan annual report (Texas Water Development Board, 2016o): (Total Gallons in System ÷ Permanent Population) ÷ 365

[8] These plans also have targets for residential GPCD and water loss as a percentage (rather than GPCD), but this report does not address those goals.

[9] As defined in TWDB water conservation plan annual report (Texas Water Development Board, 2016o): (Total Water Loss ÷ Permanent Population) ÷ 365

The estimated savings in Tables 3-1 through 3-3 indicate the best information available as provided by utility staff. Some ongoing activities may not be known and are within a utility's service area are implemented on a micro-scale that may not be quantified. Individual households and businesses may be implementing conservation measures that are unknown and therefore cannot be included in the report.

Explanation of approach to assessing water loss reduction savings

Water loss reduction savings are defined as the volume of water participating utilities are realizing from their water loss mitigation efforts. For this report, this value is the difference between each individual utility's baseline[10] for water loss GPCD and its most recent water loss GPCD reported in 2015 water loss audits on file with TWDB. Savings from all water loss reduction efforts—including pipe replacements and leak repair—are assumed to be included in this comparison to a utility's baseline.

Note that because a single year (2015) value was used for comparison, it is possible that the 2015 value could be anomalous due to a number of events that may have occurred that year, such as a water main break, a particularly wet year, or a robust effort by the utility to curtail water loss. This will distort future savings figures that were carried forward in the study because water loss will inevitably increase or decrease in later years.

Ideally, using a rolling five-year average in the calculation would correct such anomalies. However, there was insufficient data to do that for every utility. The approach was to use the most complete water loss data possible, which was represented by the 2015 water loss audit. This problem will be further minimized, as continued data collection will allow five-year averages to be calculated for a majority of utilities.

In this way, water loss savings estimates are different from all other activity savings estimates in the project. Whether savings were positive or negative depended on where individual utilities established their own baselines or where their five-year average started, and what water loss GPCD value was reported in 2015.

3.1 Current Savings Compared to Conservation WMS Supply Volume (in million gallons) in Regional Water Plan

Table 3-1 shows the 2070 outlook for Corpus Christi with the utility's yearly recommended WMS supply volume in million gallons (MG) alongside its water savings from implemented activities, including from water loss reduction. These activities and their associated savings are covered in greater detail in Sections 4 and 5.

Starting in 2015, this table compares all quantified conservation activity and the recommended conservation WMS supply volume for the planning period. The following definitions pair with the column headers in Table 3-1.

<u>Actual Current Conservation Activity Savings</u> – All quantified activities currently being

[10] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.

performed by the utility, *excluding* savings from water loss reduction. The regional planners used 2011 GPCD as the baseline for determining future conservation WMS supply volumes, therefore the study quantifies utility savings starting in 2012 for this comparison. The summary of these savings can be referenced in Table 5-1.

Actual Water Loss Reduction Savings (as of 2015) – The difference between the baseline[11] for water loss GPCD and most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB. [12] The summary of these savings can be referenced in Table 5-2.

Total Savings from All Conservation Activity – Actual Current Conservation Activity Savings plus Actual Water Loss Reduction Savings (as of 2015).

Conservation WMS Volume – The recommended municipal water conservation supply volume in the regional plan for the decades ranging from 2020 to 2070. These volumes are converted to MG from the values listed in the plan in acre-feet and then calculated in annual increments.

Water Loss Reduction WMS Volume – Some regional water plans have a separate WMS volume for water conservation and for water loss reduction for each decade. If a WUG's regional plan has a WMS volume for water loss reduction, this column will have values other than zero.

Total Yearly WMS Volume – The sum of the Conservation WMS Volume and Water Loss Reduction WMS Volume.

Over (Short) – The amount that the utility's Total Savings from All Conservation Activity (since 2012), is over or below the Total Yearly WMS Volume in the regional water plan. If the amount falls below the WMS volume, it will appear in parentheses.

[11] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.
[12] If water loss GPCD has increased from the utility's baseline or historic five-year average to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount.

Table 3-1. Current Savings Compared to Conservation WMS Supply Volume (MG) in Regional Water Plan.

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)
2015	280	228	508	334	0	334	174

3.2 Utility Water Conservation Plan Goals – Total GPCD

Table 3-2 shows how Corpus Christi's quantified savings from its implemented activities compare with 5- and 10-year goals established in its individual water conservation plan submitted to the TWDB. The following definitions pair with the column headers in Table 3-2.

Utility Population – Estimated utility service area population for the years indicated.

Total GPCD Goals – Total GPCD goals start with the utility's baseline[13] for total GPCD and progress in subsequent years to match 5- and 10-year goals indicated in a utility's five-year water conservation plan on file with the TWDB. The first five annual GPCD goals were developed by spreading the difference between the baseline and five-year goal evenly over five years. The second five annual GPCD goals spread the difference between the five-year goal and 10-year goal evenly over the next five years.

Annual Savings Goal with Reduction in GPCD (MG) – This column shows what reductions from the baseline GPCD would yield in terms of volume each year as more water is saved. The volumes indicated here are what target GPCD goals look like expressed in million gallons. Annual volumes were derived using the formula: (baseline total GPCD – target total GPCD for that year) x 365 days ÷ 1,000,000 gallons.

Total Savings for All Current Quantified Activities (MG) – Total quantified savings for all current conservation activities and savings from water loss reduction. Refer to Tables 5-1 and 5-2 for details on these savings.

Over (Short) – The amount that the utility's total quantified savings for all current conservation activities (since 2012), including water loss reduction, is over or below the volume represented by reductions in GPCD each year. If the quantified savings are less than these target volumes, the value will appear in parentheses.

Table 3-2. Utility Water Conservation Plan Goals — Total GPCD.

Year #	Year	Utility Population	Total GPCD Goals	Annual Savings Goal with Reduction in GPCD (MG)	Total Savings for All Current Quantified Activities (MG)	Over (Short) (MG)
0	**Baseline**	-	205	0	0	0
1	2014	310,719	203	227	278	51
2	2015	312,065	201	456	508	52
3	2016	320,877	199	703	1,348	646
4	2017	329,688	197	963	1,362	399
5-year Goal	2018	338,500	195	1,236	1,376	140
6	2019	347,311	193	1,547	1,389	(157)
7	2020	356,123	191	1,872	1,403	(469)
8	2021	359,618	188	2,179	1,413	(766)
9	2022	363,114	186	2,492	1,423	(1,069)
10-year Goal	2023	366,609	184	2,810	1,433	(1,377)

[13] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for total GPCD from the utility's most recently submitted five-year water conservation plan was used.

3.3 Utility Water Conservation Plan Goals – Water Loss GPCD

Table 3-3 shows how Corpus Christi's most recent water loss audit compares with 5- and 10-year water loss goals in its water conservation plan. The following definitions pair with the column headers in Table 3-2.

Utility Population – Estimated utility service area population for the years indicated.

Water Loss GPCD Goals – Water loss GPCD goals start with the utility's baseline[14] for water loss GPCD and progress in subsequent years to match 5- and 10-year water loss goals indicated in a utility's five-year water conservation plan on file with the TWDB. The first five annual GPCD goals were developed by spreading the difference between the baseline and five-year goal evenly over five years. The second five annual GPCD goals spread the difference between the five-year goal and 10-year goal evenly over the next five years.

Yearly Savings Goal with Reduction in GPCD (MG) – This column shows what reductions from the baseline water loss GPCD would yield in terms of volume each year as more water is saved. The volumes indicated here are what target water loss GPCD goals look like expressed in million gallons. Annual volumes were derived using the formula: (baseline water loss GPCD – target water loss GPCD for that year) x 365 days ÷ 1,000,000 gallons.

Total Savings from Water Loss Reduction (MG) – The difference between a utility's established baseline for water loss GPCD and the most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB. If water loss GPCD has increased from the utility's baseline to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount. Reference Table 5-2 for savings from water loss reduction.

Over (Short) – The amount that the utility's total savings from water loss reduction is over or below the volume represented by reductions in GPCD each year. If water loss reduction savings are less than these target volumes, the value will appear in parentheses.

Table 3-3. Utility Water Conservation Plan Goals — Water Loss GPCD.

Year #	Year	Utility Population	Water Loss GPCD Goals	Yearly Savings Goal with Reduction in GPCD (MG)	Total Savings from Water Loss Reduction (MG)	Over (Short) (MG)
0	**Baseline**	-	17.00	0	0	0
1	2014	310,719	16.40	68	-	-
2	2015	312,065	15.80	137	228	91
3	2016	320,877	15.20	211	234	23
4	2017	329,688	14.60	289	241	(48)
5-year Goal	2018	338,500	14.00	371	247	(124)
6	2019	347,311	13.80	406	254	(152)
7	2020	356,123	13.60	442	260	(182)
8	2021	359,618	13.40	473	263	(210)
9	2022	363,114	13.20	504	265	(239)
10-year Goal	2023	366,609	13.00	535	268	(268)

[14] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.

4 Implemented Activities

Below is a list of completed activities with estimated water savings. Note that drought response and other measures are not included in the utility's water savings because they are temporary, awareness-based or not able to be accurately quantified on an annual basis.

These are not savings projections of potential future activities. Estimated savings are based on measures that have actually been implemented. If savings are shown to persist in future years, it is because the measure is permanent, such as an ordinance, or the savings are assumed to continue for the reason listed under the itemized activity. Estimated savings from water rate increases are the one exception to these conditions.

Water Rate Increases

Savings from water rate increases were included because entities such as the U.S. Environmental Protection Agency and others indicate specific savings for utilities that raise rates (Texas Water Development Board, 2013; U.S. E.P.A., 1998; Whitcomb, 1999). This project includes surveys of several utilities that have minimal education efforts, perform no other substantive conservation activities, and yet experienced significant demand reduction that coincided with rate increases. In those cases, savings estimates matched up closely with decreases in total GPCD. For many smaller utilities, especially those with customers lacking disposable income, this measure is the only tool used to conserve other than water loss reduction.

The following assumptions were made for water rate increases:

- The model assumes that savings persist into future years because it is expected that the utility will continue to make periodic rate increases in line with the percentage increases from previous years.
- Only the last two rate increases for a utility were quantified.
- Savings grow with demand because as new customers enter the service area, they are assumed to adhere to the same price elasticity model estimates.
- A weighted average for savings was used when rate increases differed between residential and industrial-commercial-institutional (ICI) customers based on the individual utility's customer class breakdown.
- When a utility raised rates using tiered rate conservation pricing, a 50/50 savings split was used when increases differed between base and volumetric rates.
    - The reasoning is that all customers must react to the base increase, yet the pricing signal is stronger when volumetric rate increases affect the higher usage customers.
    - The 50/50 split is reasonable because many customers will not reach the higher volumetric tiers.
    - Studies show that most customers do not actually know they have reached the higher volumetric tiers; just that their bill has increased (Texas Water Development Board, 2013).

4.1 Itemized Activities

1. **Utility Website**
    a. Easy-to-use website with conservation tips and water rates
    b. Features contact information for Public Works staff and customer service

2. **Continuing Public Education**
    a. The utility engages the public in many ways including:
        i. Brochures, bill messages, displays, and exhibits

3. **Water Loss Reduction Savings**[15]
    a. Savings of 228 MG annually in 2015
    b. Water loss reduction savings = the difference between a utility's baseline[16] water loss GPCD submitted in its most recent 5-year water conservation plan and its most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB
    c. If water loss GPCD has increased from the utility's baseline or historic 5-year average to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount.
    d. All savings estimates grow each year at the same rate population figures for the utility grow in the regional water plan.

4. **Water Rate Increases**
    a. Last rate increases:[17]
        i. 7.8% increase for residential and 3.0% increase for commercial in 2014
        ii. 21.9% increase for residential and 13.6% increase for commercial in 2016
    b. Estimated customer demand reduction of 5.4%
    c. Savings is cumulative and based on more than one source[18] (U.S. EPA, 1998; Whitcomb, 1999)
        i. Savings from rate increases are shown to persist over time, however, note that savings from these pricing signals will likely decrease if rates remain the same in future years.

---

[15] If current water loss levels exceed a utility's baseline, this value is treated as a deduction from total quantified savings.
[16] In the absence of having a baseline figure provided in the utility's most recently submitted 5-year water conservation plan, the historic 5-year average for water loss GPCD in the plan was used.
[17] Correspondence with utility staff.
[18] The study estimates a 2% demand reduction with 10% increase in price on a targeted customer class. By applying a ratio, it is possible to determine the savings for lower or higher percentage increases.

5 Summary of Savings

Table 5-1. Savings by Water Conservation Activity (MG).

Year	Rain Barrels	Water Rate Increases	TOTAL SAVINGS
2009			0
2010			0
2011			0
2012			0
2013	N/A		0
2014	N/A	278.0	278
2015	N/A	279.8	280
2016	N/A	1,114.2	1,114

2021	359,618	15.00	263
2022	363,114	15.00	265
2023	366,609	15.00	268
2024	370,105	15.00	270

6 Suggested Activities

Up to four activities were chosen as potential suggested activities for individual reports. These activities are: AMI system with customer portal, twice-per-week (or less) outdoor watering ordinances, strategic water rate increases, and rain barrels.

Activities were chosen because they are:

- Achievable
- Prevalence of vendors that can actually implement them
- Acceptability to city councils, MUD boards, et al.
- Easily adopted
- Cost effective
- Yield high savings relative to cost

AMI systems with customer engagement portals were also chosen because they represent a profusion of future applications that will undoubtedly continue to advance conservation efforts. AMI and meter data management (MDM) companies are developing new and innovative ways to benefit water providers, customers, and ultimately states that are pushing conservation and usage analytics further.

Each utility should be cognizant of the potential impact that these suggested activities may have on its own unique rate and revenue situation.

Benefits to consider:

- Avoided water supply and wastewater costs
    - o The higher water purchase, transmission, and distribution costs are, the greater the potential benefit realized when large amounts of water are conserved with these activities.
- Avoided system expansion costs
    - o Conserving water may allow a utility to postpone building new system capacity by decreasing demand even as population grows.

Costs to consider:

- Staff time and resources
- Unit cost per unit saved
- Implementation costs
- Stakeholder agreement and support
- Other overhead and budget considerations

6.1 Suggested Activities with Savings Estimates

1. Twice-a-week Outdoor Watering Restriction Ordinance
    - **a.** Potentially 4.84% savings of total demand (Hermitte and Mace, 2012; Sierra Club-Lone Star Chapter and National Wildlife Federation, 2015)
    - **b.** Savings could be 996 MG per year with current demand.
    - **c.** See Table 6-1 for potential savings from this measure compared with the city's WMS supply volumes targets.

Table 6-1. Current Savings + Potential Savings from 2x per Week Watering Ordinance (MG).

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Potential Savings from Ordinance	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)
2016	1,114	234	1,348	996	417	0	417	1,927
2017	1,121	241	1,362	1,003	417	0	417	1,948
2018	1,129	247	1,376	1,009	501	0	501	1,884
2019	1,136	254	1,389	1,016	584	0	584	1,821
2020	1,143	260	1,403	1,022	751	0	751	1,674
2021	1,150	263	1,413	1,029	916	0	916	1,526
2022	1,158	265	1,423	1,035	1,080	0	1,080	1,378
2023	1,165	268	1,433	1,042	1,245	0	1,245	1,230
2024	1,172	270	1,442	1,048	1,409	0	1,409	1,081

2026	1,187	275	1,462	1,061	1,738	0	1,738	785
2027	1,194	278	1,472	1,068	1,903	0	1,903	637
2028	1,201	280	1,482	1,074	2,068	0	2,068	488
2029	1,209	283	1,491	1,081	2,232	0	2,232	340
2030	1,216	285	1,501	1,087	2,397	0	2,397	192
2031	1,220	287	1,507	1,091	2,515	0	2,515	83
2032	1,224	289	1,513	1,095	2,633	0	2,633	(26)
2033	1,228	290	1,518	1,098	2,752	0	2,752	(135)
2034	1,232	292	1,524	1,102	2,870	0	2,870	(244)
2035	1,236	293	1,530	1,106	2,988	0	2,988	(353)
2036	1,241	295	1,536	1,109	3,107	0	3,107	(462)
2037	1,245	297	1,541	1,113	3,225	0	3,225	(571)
2038	1,249	298	1,547	1,117	3,343	0	3,343	(680)
2039	1,253	300	1,553	1,120	3,462	0	3,462	(789)
2040	1,257	301	1,558	1,124	3,580	0	3,580	(897)

2. Advanced Metering Infrastructure with Customer Engagement Portal

These portals, along with mobile applications and billing statements, can provide customers with much more access to their water use data in simple and compelling formats. This access and comparison with other customers' usage can reduce water use through changed behavior, as well as provide an opportunity for other conservation programs to be offered to the customer for increased adoption and additional savings. AMI systems support leak notification and web portals with real-time data. Any water loss reduction savings that these systems also yield were included in the water loss assessment of individual reports for this project.

- **a.** Specific utility results will vary based on portal features and frequency of customer notifications
- **b.** Potential savings estimate assumes 20% of residential customers will use and save water due to the portal (Westin Engineering, 2015)
- **c.** Estimate assumes customers will save 10% of total annual use due to the portal
    - i. Savings estimate of 10% is an average of results from multiple studies (Chesnutt and Mitchell, 2013; East Bay Municipal Utility District, 2014; IBM, 2011; Texas A&M and Texas Water Resources Institute, 2016; Westin Engineering, 2015)
- **d.** Residential customers' use assumed to make up approximately 67% of all retail customers' use based on utility profile information submitted to the TWDB
    - i. This was the most common percentage of residential use among participating utilities in this project.
    - ii. Actual customer class demand percentages will vary by utility.
- **e.** 20% of residential customers saving 10% with this customer class breakdown amounts to 1.34% of total demand
- **f.** Savings are assumed to increase along with demand as connections increase each year[19]
- **g.** See Table 6-2 for potential savings from this measure compared with the utility's WMS supply volumes targets.

[19] The 10% consumption reduction figure for 20% of residential customers is conservative, but savings could be greater when monitored yearly as customer engagement increases.

Table 6-2. Current Savings + Potential Savings from AMI with Customer Portal (MG).

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Potential Savings from AMI with Customer Portal	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)
2016	1,114	234	1,348	276	417	0	417	1,207
2017	1,121	241	1,362	278	417	0	417	1,222
2018	1,129	247	1,376	279	501	0	501	1,154

2036	1,241	295	1,536	307	3,107	0	3,107	(1,264)
2037	1,245	297	1,541	308	3,225	0	3,225	(1,376)
2038	1,249	298	1,547	309	3,343	0	3,343	(1,487)
2039	1,253	300	1,553	310	3,462	0	3,462	(1,599)
2040	1,257	301	1,558	311	3,580	0	3,580	(1,710)

3. Rain Barrels
    a. In Region N, utilities could save approximately 16 gallons per year per gallon of capacity rebated, sold, or distributed (GDS Associates, 2002).
    b. Estimated 10-year useful life for most barrels

City of Brownfield Report • 2017

1 Introduction

In Texas' 2017 State Water Plan, municipal water conservation is projected to meet 9.6 percent[1] of the state's future water needs by 2070. According to the 16 regional water plans that comprise the state water plan, this is expected to be achieved through a variety of measures such as installation of water efficient plumbing fixtures, water conservation pricing structures, water system audits, landscape irrigation ordinances, as well as other water conservation activities. The 9.6 percent is "in addition to the estimated share of future passive conservation savings from plumbing codes and water efficiency standards, which are embedded in municipal water demand projections" (Texas Water Development Board, 2017).

In 2015, the Texas Legislature appropriated funds to the Texas Water Development Board (TWDB) to fund a research project principally charged with quantitatively determining the savings of municipal water conservation activities being implemented in relation to the recommended conservation goals (supply volumes) in the State Water Plan. As part of the project, individual reports were completed for all participating utilities.

With this report, utilities will benefit by receiving a clear and concise picture of its water conservation goals alongside estimated savings from quantifiable activities. In the event that current activity savings may not be able to reach long-term goals, this report offers suggestions on how utilities can reach water conservation goals with activities that are effective, easily adopted, have widespread appeal, and are quantifiable.

2 Municipal Conservation Terminology and Review of Methodology Used by Regional Planners

To make use of the results of this study, it is important to understand several key terms used in the water planning process.

What is a water user group?

In this report, a water user group (WUG) refers to a retail water provider in the form a city, municipal utility district, water control and improvement district, special utility district, water supply corporation, fresh water supply district, or other type of water utility. The TWDB further defines WUGs as one of the following (Texas Water Development Board, 2016b):

- Cities and towns with a population of 500 or more
- Non-city utilities providing more than 280 acre-feet per year per year of water for municipal use
- Collective reporting units (CRUs) consisting of grouped utilities having a common association

[1] Equal to 811,224 acre-feet per year in conservation savings.

- County-Wide WUGs:
  - County-Other (Rural/unincorporated areas of municipal water use)
  - Manufacturing
  - Steam electric power generation

What is a recommended water management strategy?

A recommended water management strategy (WMS) is a measure that will help ensure WUGs have adequate water supplies for their end users well into the future. WMS examples include river diversions, groundwater use, reservoir and aquifer development, and irrigation conservation. When WMS is referred to in this report, it refers only to municipal conservation, which may include water loss reduction as a part of the same strategy.

What is a WMS supply volume?

A WMS supply volume is the amount of water that a given strategy is expected to yield each decade in the planning period if carried out by the WUG. In this report, a WMS supply volume is the amount of water recommended to come from municipal water conservation.

Some regional water plans separate this strategy's supply volume into a volume for municipal water conservation and a volume for water loss reduction for each decade. The total strategy supply volume is the sum of both. A regional water plan may also refer to "advanced conservation" as part of this strategy. Advanced conservation usually indicates that the volume could be achieved through a more robust mix of conservation activities described in the plan.

2.1 Regional Planning Group Approach to Determining Supply Volumes

Each regional water planning group (RWPG) is responsible for producing its own individual plan that, if executed, will provide sufficient water to its WUGs throughout a 50-year planning period. These plans are completed in five-year cycles, with the most recent edition being completed in 2016. The 2016 regional plans make up the 2017 State Water Plan, which sets out WMS supply volumes for the years 2020 through 2070.

The decadal WMS supply volumes for municipal conservation were established by each of the RWPGs in much the same manner. The RWPGs generally followed the guidelines of the Texas Legislature's Water Conservation Implementation Task Force on the pace utilities should target to reduce gallons per capita per day (GPCD)[2] consumption levels.

The targeted reductions used by most regions follow this formula:

- For municipal WUGs with water use of 140 GPCD and greater, the goal is to reduce per capita water use by one percent per year until the level of 140 GPCD is reached,

[2] Regional water planning GPCD is defined as the annual volume of water pumped, diverted, or purchased minus the volume exported (sold) to other water systems or large industrial facilities divided by the permanent resident population of the Municipal Water User Group in the regional water planning process divided by 365. Saline and reused/recycled water are not included in this volume (Texas Water Development Board, 2012).

after which, the goal is to reduce per capita water use by one-fourth percent per year for the remainder of the planning period (Texas Water Development Board, 2016j).

The yearly reductions in GPCD for a given WUG are then converted into recommended supply volumes in acre-feet per year for each decade as the reductions in consumption continue. Some regions reduce GPCD by slightly different percentages before and after the 140 GPCD threshold, some do not apply further reductions in GPCD for WUGs once they reach 140 GPCD, while others recommend only "advanced conservation" activities once WUGs meet 140 GPCD.

2.2 Methodology

In order to complete a uniform quantification process, the first engagement was with utilities that agreed to participate and collected as much relevant data as possible. These data included, among many others, historical GPCD consumption figures, advanced metering infrastructure (AMI) specifications, and detailed feedback on each conservation activity being implemented. Personal interviews focused on determining when and to what extent these activities were being employed, as well as assessing plans to continue such conservation. Examples of frequently implemented activities include tiered water rate conservation pricing, strategic water rate increases, outdoor irrigation audits and ordinances, and rain barrel distribution.

Subsequently, each utility's conservation activities were quantified through several different means, including evidence-based studies, utility field results and savings determinations, manufacturer guarantees, water loss audits, TWDB studies, and other information that assigned a savings value to the activity's implementation.

Every conservation activity studied and quantified has a gallons-per-year estimate, useful life, and decay rate (if applicable) associated with it. Some activities' savings are projected to grow as demand grows over time, while some savings are constant each year and subside once useful life has run its course. For expanded methodology and details on studies and formulas used to determine activity savings, refer to Section 6 of the State Report included as part of this document.

Once analyzed, the resulting savings estimates from each utility were compared with the recommended WMS supply volumes in its respective regional plan to determine if the savings met, exceeded, or fell short of those volumes. Individual utility savings were aggregated to compare with regional volumes, and regional savings were aggregated to compare with state volumes.

It is important to note that this report quantified activity savings—not including water loss reduction—for the WMS supply volume comparison dating back to 2012. The reason for this is, with a few exceptions, the regional planners used 2011 as the base year for establishing potential WMS supply volumes.[3] In addition, any conservation savings achieved through 2011 are assumed to be accounted for in the regional water planning GPCD for that year.[4] Thus, quantifying from 2012 and forward is the most accurate way to determine if utilities are meeting

[3] Confirmed via personal communication with Region C, H, K, and L Plan consultants.
[4] It was established with TWDB planning staff that 2011 GPCD levels were chosen because they represented the most current water use and conservation patterns at the time.

the recommended conservation volumes in the regional plans. This assumption is by no means 100 percent accurate, however. Some previously implemented activities' savings persist into future years beyond this starting point, while some activities' savings have ceased. One year's GPCD will not necessarily include all savings yielded by conservation activities that came before it, but the quantification assessment must have a starting point.

2.3 Quantifiable Savings

The key to the project being useful and reliable is that the results from year to year are measurable. Quantifying conservation activities that can be accurately measured provides greater certainty and better planning for all stakeholders.

While many utilities are engaged in a variety of conservation activities, not all can currently be properly measured. Some examples of these activities include education initiatives, website and social media engagement, and enforcement for water waste. That does not mean these measures are not essential. Education of consumers, for example, is a fundamental activity that makes all others effective, but little hard data exists to quantify the results of education alone.

In addition, the work of conservation coordinators can have a particularly significant effect on the savings of all other activities, but the specific savings attributed to that staff role is difficult to quantify.

3 Results

This report compares Brownfield's current water conservation activities and their quantified savings to two metrics: 1) Region O Water Plan's (Texas Water Development Board, 2016m) recommended WMS supply volumes for municipal conservation, and 2) Brownfield's own 5- and 10-year goals as established in its most recent water conservation plan submitted to the TWDB.

The WMS supply volumes for municipal water conservation are laid out by decade (2020 – 2070) in the regional water plans to serve as benchmarks for what each utility could achieve via that strategy during a 50-year planning period.[5]

The five- and 10-year goals in Brownfield's most recent water conservation plan are established by the utility as realistic targets for reducing consumption over that timeframe. These reductions[6] are expressed in decreasing total GPCD [7] consumption and water loss GPCD.[8] [9]

The estimated savings in Tables 3-1 through 3-3 indicate the best information available as provided by utility staff. Some ongoing activities may not be known and are within a utility's

[5] Some regional water plans separate this strategy volume into a volume for water conservation and a volume for water loss reduction for each decade. The total strategy volume is the sum of both.

[6] Occasionally, some utilities expect consumption to increase due to various reasons, such as an incoming industrial presence expected to raise consumption figures for the entire service area.

[7] As defined in TWDB water conservation annual reports: (Total Gallons in System ÷ Permanent Population) ÷ 365

[8] These plans also have targets for residential GPCD and water loss as a percentage (rather than GPCD), but this report does not address those goals.

[9] As defined in annual TWDB water loss audits: (Total Water Loss ÷ Permanent Population) ÷ 365

service area are implemented on a micro-scale that may not be quantified. Individual households and businesses may be implementing conservation measures that are unknown and therefore cannot be included in the report.

Explanation of approach to assessing water loss reduction savings

Water loss reduction savings are defined as the volume of water participating utilities are realizing from their water loss mitigation efforts. For this report, this value is the difference between each individual utility's baseline[10] for water loss GPCD and its most recent water loss GPCD reported in 2015 water loss audits on file with TWDB. Savings from all water loss reduction efforts—including pipe replacements and leak repair—are assumed to be included in this comparison to a utility's baseline.

Note that because a single year (2015) value was used for comparison, it is possible that the 2015 value could be anomalous due to a number of events that may have occurred that year, such as a water main break, a particularly wet year, or a robust effort by the utility to curtail water loss. This will distort future savings figures that were carried forward in the study because water loss will inevitably increase or decrease in later years.

Ideally, using a rolling five-year average in the calculation would correct such anomalies. However, there was insufficient data to do that for every utility. The approach was to use the most complete water loss data possible, which was represented by the 2015 water loss audit. This problem will be further minimized, as continued data collection will allow five-year averages to be calculated for a majority of utilities.

In this way, water loss savings estimates are different from all other activity savings estimates in the project. Whether savings were positive or negative depended on where individual utilities established their own baselines or where their five-year average started, and what water loss GPCD value was reported in 2015.

3.1 Current Savings Compared to Conservation WMS Supply Volume (in million gallons) in Regional Water Plan

Table 3-1 shows the 2070 outlook for Brownfield with the utility's yearly recommended WMS supply volume in million gallons (MG) alongside its water savings from implemented activities, including from water loss reduction. These activities and their associated savings are covered in greater detail in Sections 4 and 5.

Starting in 2015, this table compares all quantified conservation activity and the recommended conservation WMS supply volume for the planning period. The following definitions pair with the column headers in Table 3-1.

<u>Actual Current Conservation Activity Savings</u> – All quantified activities currently being performed by the utility, *excluding* savings from water loss reduction. The regional planners used 2011 GPCD as the baseline for determining future conservation WMS supply volumes, therefore

[10] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.

the study quantifies utility savings starting in 2012 for this comparison. The summary of these savings can be referenced in Table 5-1.

Actual Water Loss Reduction Savings (as of 2015) – The difference between the baseline[11] for water loss GPCD and most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB. [12] The summary of these savings can be referenced in Table 5-2.

Total Savings from All Conservation Activity – Actual Current Conservation Activity Savings plus Actual Water Loss Reduction Savings (as of 2015).

Conservation WMS Volume – The recommended municipal water conservation supply volume in the regional plan for the decades ranging from 2020 to 2070. These volumes are converted to MG from the values listed in the plan in acre-feet and then calculated in annual increments.

Water Loss Reduction WMS Volume – Some regional water plans have a separate WMS volume for water conservation and for water loss reduction for each decade. If a WUG's regional plan has a WMS volume for water loss reduction, this column will have values other than zero.

Total Yearly WMS Volume – The sum of the Conservation WMS Volume and Water Loss Reduction WMS Volume.

Over (Short) – The amount that the utility's Total Savings from All Conservation Activity (since 2012), is over or below the Total Yearly WMS Volume in the regional water plan. If the amount falls below the WMS volume, it will appear in parentheses.

[11] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.
[12] If water loss GPCD has increased from the utility's baseline or historic five-year average to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount.

Table 3-1. Current Savings Compared to Conservation WMS Supply Volume (MG) in Regional Water Plan.

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)
2015	7.8	3.6	11	13	0	13	(2)
2016	22.5	3.6	26	16	0	16	10
2017	22.6	3.6	26	16	0	16	10
2018	22.6	3.7	26	20	0	20	7
2019	22.7	3.7	26	23	0	23	4
2020	22.8	3.8	27	29	0	29	(3)
2021	22.9	3.8	27	29	0	29	(3)
2022	22.9	3.8	27	30	0	30	(3)
2023	23.0	3.9	27	30	0	30	(3)
2024	23.1	3.9	27	30	0	30	(3)
2025	23.2	3.9	27	30	0	30	(3)
2026	23.3	3.9	27	30	0	30	(3)
2027	23.3	4.0	27	30	0	30	(3)
2028	23.4	4.0	27	30	0	30	(3)
2029	23.5	4.0	27	30	0	30	(3)
2030	23.6	4.0	28	30	0	30	(3)
2031	23.7	4.1	28	30	0	30	(3)
2032	23.7	4.1	28	30	0	30	(2)
2033	23.8	4.1	28	30	0	30	(2)

2064	27.0	4.8	32	24	0	24	8
2065	27.1	4.8	32	24	0	24	8
2066	27.2	4.8	32	24	0	24	8
2067	27.3	4.8	32	24	0	24	8
2068	27.4	4.8	32	24	0	24	8
2069	27.5	4.9	32	24	0	24	8
2070	27.6	4.9	32	24	0	24	8

3.2 Utility Water Conservation Plan Goals – Total GPCD

Table 3-2 shows how Brownfield's quantified savings from its implemented activities compare with 5- 10 year goals established in its individual water conservation plan submitted to the TWDB. The following definitions pair with the column headers in Table 3-2.

Utility Population – Estimated utility service area population for the years indicated.

Total GPCD Goals – Total GPCD goals start with the utility's baseline[13] for total GPCD and progress in subsequent years to match 5- and 10-year goals indicated in a utility's five-year water conservation plan on file with the TWDB. The first five annual GPCD goals were developed by spreading the difference between the baseline and five-year goal evenly over five years. The second five annual GPCD goals spread the difference between the five-year goal and 10-year goal evenly over the next five years.

Annual Savings Goal with Reduction in GPCD (MG) – This column shows what reductions from the baseline GPCD would yield in terms of volume each year as more water is saved. The volumes indicated here are what target GPCD goals look like expressed in million gallons. Annual volumes were derived using the formula: (baseline total GPCD – target total GPCD for that year) x 365 days ÷ 1,000,000 gallons.

Total Savings for All Current Quantified Activities (MG) – Total quantified savings for all current conservation activities and savings from water loss reduction. Refer to Tables 5-1 and 5-2 for details on these savings.

Over (Short) – The amount that the utility's total quantified savings for all current conservation activities (since 2012), including water loss reduction, is over or below the volume represented by reductions in GPCD each year. If the quantified savings are less than these target volumes, the value will appear in parentheses.

Table 3-2. Utility Water Conservation Plan Goals — Total GPCD.

Year #	Year	Utility Population	Total GPCD Goals	Annual Savings Goal with Reduction in GPCD (MG)	Total Savings for All Current Quantified Activities (MG)	Over (Short) (MG)
0	**Baseline**	-	143	0	0	0
1	2015	9,736	141	6	11	5
2	2016	9,865	139	13	26	13
3	2017	9,994	138	20	26	7
4	2018	10,123	136	27	26	0
5-year Goal	2019	10,252	134	34	26	(7)
6	2020	10,381	133	36	27	(10)
7	2021	10,447	133	39	27	(12)
8	2022	10,512	132	41	27	(15)
9	2023	10,578	132	44	27	(17)
10-year Goal	2024	10,643	131	47	27	(20)

[13] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for total GPCD from the utility's most recently submitted five-year water conservation plan was used.

3.3 Utility Water Conservation Plan Goals – Water Loss GPCD

Table 3-3 shows how Brownfield's most recent water loss audit compares with 5- and 10-year water loss goals in its water conservation plan. The following definitions pair with the column headers in Table 3-2.

Utility Population – Estimated utility service area population for the years indicated.

Water Loss GPCD Goals – Water loss GPCD goals start with the utility's baseline[14] for water loss GPCD and progress in subsequent years to match 5- and 10-year water loss goals indicated in a utility's five-year water conservation plan on file with the TWDB. The first five annual GPCD goals were developed by spreading the difference between the baseline and five-year goal evenly over five years. The second five annual GPCD goals spread the difference between the five-year goal and 10-year goal evenly over the next five years.

Yearly Savings Goal with Reduction in GPCD (MG) – This column shows what reductions from the baseline water loss GPCD would yield in terms of volume each year as more water is saved. The volumes indicated here are what target water loss GPCD goals look like expressed in million gallons. Annual volumes were derived using the formula: (baseline water loss GPCD – target water loss GPCD for that year) x 365 days ÷ 1,000,000 gallons.

Total Savings from Water Loss Reduction (MG) – The difference between a utility's established baseline for water loss GPCD and the most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB. If water loss GPCD has increased from the utility's baseline to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount. Reference Table 5-2 for savings from water loss reduction.

Over (Short) – The amount that the utility's total savings from water loss reduction is over or below the volume represented by reductions in GPCD each year. If water loss reduction savings are less than these target volumes, the value will appear in parentheses.

Table 3-3. Utility Water Conservation Plan Goals — Water Loss GPCD.

Year #	Year	Utility Population	Water Loss GPCD Goals	Yearly Savings Goal with Reduction in GPCD (MG)	Total Savings from Water Loss Reduction (MG)	Over (Short) (MG)
0	**Baseline**	-	6.00	0	0	0
1	2015	9,736	5.60	1	3.6	2
2	2016	9,865	5.20	3	3.6	1
3	2017	9,994	4.80	4	3.6	(1)
4	2018	10,123	4.40	6	3.7	(2)
5-year Goal	2019	10,252	4.00	7	3.7	(4)
6	2020	10,381	3.80	8	3.8	(5)
7	2021	10,447	3.60	9	3.8	(5)
8	2022	10,512	3.40	10	3.8	(6)
9	2023	10,578	3.20	11	3.9	(7)
10-year Goal	2024	10,643	3.00	12	3.9	(8)

[14] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.

4 Implemented Activities

Below is a list of completed activities with estimated water savings. Note that drought response and other measures are not included in the utility's water savings because they are temporary, awareness-based or not able to be accurately quantified on an annual basis.

These are not savings projections of potential future activities. Estimated savings are based on measures that have actually been implemented. If savings are shown to persist in future years, it is because the measure is permanent, such as an ordinance, or the savings are assumed to continue for the reason listed under the itemized activity. Estimated savings from water rate increases are the one exception to these conditions.

Water Rate Increases

Savings from water rate increases were included because entities such as the U.S. Environmental Protection Agency and others indicate specific savings for utilities that raise rates (Texas Water Development Board, 2013; U.S. E.P.A., 1998; Whitcomb, 1999). This project includes surveys of several utilities that have minimal education efforts, perform no other substantive conservation activities, and yet experienced significant demand reduction that coincided with rate increases. In those cases, savings estimates matched up closely with decreases in total GPCD. For many smaller utilities, especially those with customers lacking disposable income, this measure is the only tool used to conserve other than water loss reduction.

The following assumptions were made for water rate increases:

- The model assumes that savings persist into future years because it is expected that the utility will continue to make periodic rate increases in line with the percentage increases from previous years.
- Only the last two rate increases for a utility were quantified.
- Savings grow with demand because as new customers enter the service area, they are assumed to adhere to the same price elasticity model estimates.
- A weighted average for savings was used when rate increases differed between residential and industrial-commercial-institutional (ICI) customers based on the individual utility's customer class breakdown.
- When a utility raised rates using tiered rate conservation pricing, a 50/50 savings split was used when increases differed between base and volumetric rates.
    - The reasoning is that all customers must react to the base increase, yet the pricing signal is stronger when volumetric rate increases affect the higher usage customers.
    - The 50/50 split is reasonable because many customers will not reach the higher volumetric tiers.
    - Studies show that most customers do not actually know they have reached the higher volumetric tiers; just that their bill has increased (Texas Water Development Board, 2013).

4.1 Itemized Activities

1. **Utility Website**
    a. Easy-to-use website with conservation tips and water rates
    b. Features contact information for Public Works staff and customer service

2. **Continuing Public Education**
    a. The utility engages the public in many ways including:
        i. Brochures, bill messages, displays, and exhibits

3. **Water Loss Reduction Savings**[15]
    a. Savings of 3.6 MG annually in 2015
    b. Water loss reduction savings = the difference between a utility's baseline[16] water loss GPCD submitted in its most recent 5-year water conservation plan and its most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB
    c. If water loss GPCD has increased from the utility's baseline or historic 5-year average to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount.
    d. All savings estimates grow each year at the same rate population figures for the utility grow in the regional water plan.

4. **Water Rate Increases**
    a. Last rate increases:[17]
        i. 6.8% increase in 2015
        ii. 12.8% increase in 2016
    b. Estimated customer demand reduction of 5.26%
    c. Savings is cumulative and based on more than one source[18] (U.S. EPA, 1998; Whitcomb, 1999)
    d. Savings from rate increases are shown to persist over time, however, note that savings from these pricing signals will likely decrease if rates remain the same in future years.

---

[15] If current water loss levels exceed a utility's baseline, this value is treated as a deduction from total quantified savings.
[16] In the absence of having a baseline figure provided in the utility's most recently submitted 5-year water conservation plan, the historic 5-year average for water loss GPCD in the plan was used.
[17] Correspondence with utility staff.
[18] The study estimates a 2% demand reduction with 10% increase in price on a targeted customer class. By applying a ratio, it is possible to determine the savings for lower or higher percentage increases.

5 Summary of Savings

Table 5-1. Savings by Water Conservation Activity (MG).

Year	Water Rate Increases	TOTAL SAVINGS
2009		0
2010		0
2011		0
2012		0
2013		0
2014		0
2015	7.8	7.8
2016	22.5	22.5
2017	22.6	22.6
2018	22.6	22.6

2024	10,643	5.00	4

6 Suggested Activities

Up to four activities were chosen as potential suggested activities for individual reports. These activities are: AMI system with customer portal, twice-per-week (or less) outdoor watering ordinances, strategic water rate increases, and rain barrels.

Activities were chosen because they are:

- Achievable
- Prevalence of vendors that can actually implement them
- Acceptability to city councils, MUD boards, et al.
- Easily adopted
- Cost effective
- Yield high savings relative to cost

AMI systems with customer engagement portals were also chosen because they represent a profusion of future applications that will undoubtedly continue to advance conservation efforts. AMI and meter data management (MDM) companies are developing new and innovative ways to benefit water providers, customers, and ultimately states that are pushing conservation and usage analytics further.

Each utility should be cognizant of the potential impact that these suggested activities may have on its own unique rate and revenue situation.

Benefits to consider:

- Avoided water supply and wastewater costs
    - The higher water purchase, transmission, and distribution costs are, the greater the potential benefit realized when large amounts of water are conserved with these activities.
- Avoided system expansion costs
    - Conserving water may allow a utility to postpone building new system capacity by decreasing demand even as population grows.

Costs to consider:

- Staff time and resources
- Unit cost per unit saved
- Implementation costs
- Stakeholder agreement and support
- Other overhead and budget considerations

6.1 Suggested Activities with Savings Estimates

1. Advanced Metering Infrastructure with Customer Engagement Portal

These portals, along with mobile applications and billing statements, can provide customers with much more access to their water use data in simple and compelling formats. This access and comparison with other customers' usage can reduce water use through changed behavior, as well as provide an opportunity for other conservation programs to be offered to the customer for increased adoption and additional savings. AMI systems support leak notification and web portals with real-time data. Any water loss reduction savings that these systems also yield were included in the water loss assessment of individual reports for this project.

a. Specific utility results will vary based on portal features and frequency of customer notifications

b. Potential savings estimate assumes 20% of residential customers will use and save water due to the portal (Westin Engineering, 2015)

c. Estimate assumes customers will save 10% of total annual use due to the portal

  i. Savings estimate of 10% is an average of results from multiple studies (Chesnutt and Mitchell, 2013; East Bay Municipal Utility District, 2014; IBM, 2011; Texas A&M and Texas Water Resources Institute, 2016; Westin Engineering, 2015)

d. Residential customers' use assumed to make up approximately 67% of all retail customers' use based on utility profile information submitted to the TWDB

  i. This was the most common percentage of residential use among participating utilities in this project.

  ii. Actual customer class demand percentages will vary by utility.

e. 20% of residential customers saving 10% with this customer class breakdown amounts to 1.34% of total demand

f. Savings are assumed to increase along with demand as connections increase each year[19]

g. See Table 6-1 for potential savings from this measure compared with the utility's WMS supply volumes targets.

[19] The 10% consumption reduction figure for 20% of residential customers is conservative, but savings could be greater when monitored yearly as customer engagement increases.

Table 6-1. Current Savings + Potential Savings from AMI with Customer Portal (MG).

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Potential Savings from AMI with Customer Portal	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)

2040	24	4	29	8	30	0	30	7

Statewide Water Conservation Quantification Project
City of Lamesa Report • 2017

1 Introduction

In Texas' 2017 State Water Plan, municipal water conservation is projected to meet 9.6 percent[1] of the state's future water needs by 2070. According to the 16 regional water plans that comprise the state water plan, this is expected to be achieved through a variety of measures such as installation of water efficient plumbing fixtures, water conservation pricing structures, water system audits, landscape irrigation ordinances, as well as other water conservation activities. The 9.6 percent is "in addition to the estimated share of future passive conservation savings from plumbing codes and water efficiency standards, which are embedded in municipal water demand projections" (Texas Water Development Board, 2017).

In 2015, the Texas Legislature appropriated funds to the Texas Water Development Board (TWDB) to fund a research project principally charged with quantitatively determining the savings of municipal water conservation activities being implemented in relation to the recommended conservation goals (supply volumes) in the State Water Plan. As part of the project, individual reports were completed for all participating utilities.

With this report, utilities will benefit by receiving a clear and concise picture of its water conservation goals alongside estimated savings from quantifiable activities. In the event that current activity savings may not be able to reach long-term goals, this report offers suggestions on how utilities can reach water conservation goals with activities that are effective, easily adopted, have widespread appeal, and are quantifiable.

2 Municipal Conservation Terminology and Review of Methodology Used by Regional Planners

To make use of the results of this study, it is important to understand several key terms used in the water planning process.

What is a water user group?

In this report, a water user group (WUG) refers to a retail water provider in the form a city, municipal utility district, water control and improvement district, special utility district, water supply corporation, fresh water supply district, or other type of water utility. The TWDB further defines WUGs as one of the following (Texas Water Development Board, 2016b):

- Cities and towns with a population of 500 or more
- Non-city utilities providing more than 280 acre-feet per year per year of water for municipal use
- Collective reporting units (CRUs) consisting of grouped utilities having a common association

[1] Equal to 811,224 acre-feet per year in conservation savings.

- County-Wide WUGs:
    - County-Other (Rural/unincorporated areas of municipal water use)
    - Manufacturing
    - Steam electric power generation

What is a recommended water management strategy?

A recommended water management strategy (WMS) is a measure that will help ensure WUGs have adequate water supplies for their end users well into the future. WMS examples include river diversions, groundwater use, reservoir and aquifer development, and irrigation conservation. When WMS is referred to in this report, it refers only to municipal conservation, which may include water loss reduction as a part of the same strategy.

What is a WMS supply volume?

A WMS supply volume is the amount of water that a given strategy is expected to yield each decade in the planning period if carried out by the WUG. In this report, a WMS supply volume is the amount of water recommended to come from municipal water conservation.

Some regional water plans separate this strategy's supply volume into a volume for municipal water conservation and a volume for water loss reduction for each decade. The total strategy supply volume is the sum of both. A regional water plan may also refer to "advanced conservation" as part of this strategy. Advanced conservation usually indicates that the volume could be achieved through a more robust mix of conservation activities described in the plan.

2.1 Regional Planning Group Approach to Determining Supply Volumes

Each regional water planning group (RWPG) is responsible for producing its own individual plan that, if executed, will provide sufficient water to its WUGs throughout a 50-year planning period. These plans are completed in five-year cycles, with the most recent edition being completed in 2016. The 2016 regional plans make up the 2017 State Water Plan, which sets out WMS supply volumes for the years 2020 through 2070.

The decadal WMS supply volumes for municipal conservation were established by each of the RWPGs in much the same manner. The RWPGs generally followed the guidelines of the Texas Legislature's Water Conservation Implementation Task Force on the pace utilities should target to reduce gallons per capita per day (GPCD)[2] consumption levels.

The targeted reductions used by most regions follow this formula:

- For municipal WUGs with water use of 140 GPCD and greater, the goal is to reduce per capita water use by one percent per year until the level of 140 GPCD is reached,

[2] Regional water planning GPCD is defined as the annual volume of water pumped, diverted, or purchased minus the volume exported (sold) to other water systems or large industrial facilities divided by the permanent resident population of the Municipal Water User Group in the regional water planning process divided by 365. Saline and reused/recycled water are not included in this volume (Texas Water Development Board, 2012).

after which, the goal is to reduce per capita water use by one-fourth percent per year for the remainder of the planning period (Texas Water Development Board, 2016j).

The yearly reductions in GPCD for a given WUG are then converted into recommended supply volumes in acre-feet per year for each decade as the reductions in consumption continue. Some regions reduce GPCD by slightly different percentages before and after the 140 GPCD threshold, some do not apply further reductions in GPCD for WUGs once they reach 140 GPCD, while others recommend only "advanced conservation" activities once WUGs meet 140 GPCD.

2.2 Methodology

In order to complete a uniform quantification process, the first engagement was with utilities that agreed to participate and collected as much relevant data as possible. These data included, among many others, historical GPCD consumption figures, advanced metering infrastructure (AMI) specifications, and detailed feedback on each conservation activity being implemented. Personal interviews focused on determining when and to what extent these activities were being employed, as well as assessing plans to continue such conservation. Examples of frequently implemented activities include tiered water rate conservation pricing, strategic water rate increases, outdoor irrigation audits and ordinances, and rain barrel distribution.

Subsequently, each utility's conservation activities were quantified through several different means, including evidence-based studies, utility field results and savings determinations, manufacturer guarantees, water loss audits, TWDB studies, and other information that assigned a savings value to the activity's implementation.

Every conservation activity studied and quantified has a gallons-per-year estimate, useful life, and decay rate (if applicable) associated with it. Some activities' savings are projected to grow as demand grows over time, while some savings are constant each year and subside once useful life has run its course. For expanded methodology and details on studies and formulas used to determine activity savings, refer to Section 6 of the State Report included as part of this document.

Once analyzed, the resulting savings estimates from each utility were compared with the recommended WMS supply volumes in its respective regional plan to determine if the savings met, exceeded, or fell short of those volumes. Individual utility savings were aggregated to compare with regional volumes, and regional savings were aggregated to compare with state volumes.

It is important to note that this report quantified activity savings—not including water loss reduction—for the WMS supply volume comparison dating back to 2012. The reason for this is, with a few exceptions, the regional planners used 2011 as the base year for establishing potential WMS supply volumes.[3] In addition, any conservation savings achieved through 2011 are assumed to be accounted for in the regional water planning GPCD for that year.[4] Thus, quantifying from 2012 and forward is the most accurate way to determine if utilities are meeting

[3] Confirmed via personal communication with Region C, H, K, and L Plan consultants.
[4] It was established with TWDB planning staff that 2011 GPCD levels were chosen because they represented the most current water use and conservation patterns at the time.

the recommended conservation volumes in the regional plans. This assumption is by no means 100 percent accurate, however. Some previously implemented activities' savings persist into future years beyond this starting point, while some activities' savings have ceased. One year's GPCD will not necessarily include all savings yielded by conservation activities that came before it, but the quantification assessment must have a starting point.

2.3 Quantifiable Savings

The key to the project being useful and reliable is that the results from year to year are measurable. Quantifying conservation activities that can be accurately measured provides greater certainty and better planning for all stakeholders.

While many utilities are engaged in a variety of conservation activities, not all can currently be properly measured. Some examples of these activities include education initiatives, website and social media engagement, and enforcement for water waste. That does not mean these measures are not essential. Education of consumers, for example, is a fundamental activity that makes all others effective, but little hard data exists to quantify the results of education alone.

In addition, the work of conservation coordinators can have a particularly significant effect on the savings of all other activities, but the specific savings attributed to that staff role is difficult to quantify.

3 Results

This report compares Lamesa's current water conservation activities and their quantified savings to two metrics: 1) Region O Water Plan's (Texas Water Development Board, 2016m) recommended WMS supply volumes for municipal conservation, and 2) Lamesa's own 5- and 10-year goals as established in its most recent water conservation plan submitted to the TWDB.

The WMS supply volumes for municipal water conservation are laid out by decade (2020 – 2070) in the regional water plans to serve as benchmarks for what each utility could achieve via that strategy during a 50-year planning period.[5]

The 5- and 10-year goals in Lamesa's most recent water conservation plan are established by the utility as realistic targets for reducing consumption over that timeframe. These reductions[6] are expressed in decreasing total GPCD[7] consumption and water loss GPCD.[8] [9]

The estimated savings in Tables 3-1 through 3-3 indicate the best information available as provided by utility staff. Some ongoing activities may not be known and are within a utility's service area are implemented on a micro-scale that may not be quantified. Individual households

[5] Some regional water plans separate this strategy volume into a volume for water conservation and a volume for water loss reduction for each decade. The total strategy volume is the sum of both.

[6] Occasionally, some utilities expect consumption to increase due to various reasons, such as an incoming industrial presence expected to raise consumption figures for the entire service area.

[7] As defined in TWDB water conservation annual reports: (Total Gallons in System ÷ Permanent Population) ÷ 365

[8] These plans also have targets for residential GPCD and water loss as a percentage (rather than GPCD), but this report does not address those goals.

[9] As defined in annual TWDB water loss audits: (Total Water Loss ÷ Permanent Population) ÷ 365

and businesses may be implementing conservation measures that are unknown and therefore cannot be included in the report.

Explanation of approach to assessing water loss reduction savings

Water loss reduction savings are defined as the volume of water participating utilities are realizing from their water loss mitigation efforts. For this report, this value is the difference between each individual utility's baseline[10] for water loss GPCD and its most recent water loss GPCD reported in 2015 water loss audits on file with TWDB. Savings from all water loss reduction efforts—including pipe replacements and leak repair—are assumed to be included in this comparison to a utility's baseline.

Note that because a single year (2015) value was used for comparison, it is possible that the 2015 value could be anomalous due to a number of events that may have occurred that year, such as a water main break, a particularly wet year, or a robust effort by the utility to curtail water loss. This will distort future savings figures that were carried forward in the study because water loss will inevitably increase or decrease in later years.

Ideally, using a rolling five-year average in the calculation would correct such anomalies. However, there was insufficient data to do that for every utility. The approach was to use the most complete water loss data possible, which was represented by the 2015 water loss audit. This problem will be further minimized, as continued data collection will allow five-year averages to be calculated for a majority of utilities.

In this way, water loss savings estimates are different from all other activity savings estimates in the project. Whether savings were positive or negative depended on where individual utilities established their own baselines or where their five-year average started, and what water loss GPCD value was reported in 2015.

3.1 Current Savings Compared to Conservation WMS Supply Volume (in million gallons) in Regional Water Plan

Table 3-1 shows the 2070 outlook for Lamesa with the utility's yearly recommended WMS supply volume in million gallons (MG) alongside its water savings from implemented activities, including from water loss reduction. These activities and their associated savings are covered in greater detail in Sections 4 and 5.

Starting in 2015, this table compares all quantified conservation activity and the recommended conservation WMS supply volume for the planning period. The following definitions pair with the column headers in Table 3-1.

<u>Actual Current Conservation Activity Savings</u> – All quantified activities currently being performed by the utility, *excluding* savings from water loss reduction. The regional planners used 2011 GPCD as the baseline for determining future conservation WMS supply volumes, therefore the study quantifies utility savings starting in 2012 for this comparison.

[10] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.

Actual Water Loss Reduction Savings (as of 2015) – The difference between the baseline[11] for water loss GPCD and most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB. [12] The summary of these savings can be referenced in Table 5-1.

Total Savings from All Conservation Activity – Actual Current Conservation Activity Savings plus Actual Water Loss Reduction Savings (as of 2015).

Conservation WMS Volume – The recommended municipal water conservation supply volume in the regional plan for the decades ranging from 2020 to 2070. These volumes are converted to MG from the values listed in the plan in acre-feet and then calculated in annual increments.

Water Loss Reduction WMS Volume – Some regional water plans have a separate WMS volume for water conservation and for water loss reduction for each decade. If a WUG's regional plan has a WMS volume for water loss reduction, this column will have values other than zero.

Total Yearly WMS Volume – The sum of the Conservation WMS Volume and Water Loss Reduction WMS Volume.

Over (Short) – The amount that the utility's Total Savings from All Conservation Activity (since 2012), is over or below the Total Yearly WMS Volume in the regional water plan. If the amount falls below the WMS volume, it will appear in parentheses.

[11] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.
[12] If water loss GPCD has increased from the utility's baseline or historic five-year average to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount.

Table 3-1. Current Savings Compared to Conservation WMS Supply Volume (MG) in Regional Water Plan.

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)
2015	38	3.44	42	17	0	17	25

3.2 Utility Water Conservation Plan Goals – Total GPCD

Table 3-2 shows how Lamesa's quantified savings from its implemented activities compare with 5- and 10-year goals established in its individual water conservation plan submitted to the TWDB. The following definitions pair with the column headers in Table 3-2.

Utility Population – Estimated utility service area population for the years indicated.

Total GPCD Goals – Total GPCD goals start with the utility's baseline[13] for total GPCD and progress in subsequent years to match 5- and 10-year goals indicated in a utility's five-year water conservation plan on file with the TWDB. The first five annual GPCD goals were developed by spreading the difference between the baseline and five-year goal evenly over five years. The second five annual GPCD goals spread the difference between the five-year goal and 10-year goal evenly over the next five years.

Annual Savings Goal with Reduction in GPCD (MG) – This column shows what reductions from the baseline GPCD would yield in terms of volume each year as more water is saved. The volumes indicated here are what target GPCD goals look like expressed in million gallons. Annual volumes were derived using the formula: (baseline total GPCD – target total GPCD for that year) x 365 days ÷ 1,000,000 gallons.

Total Savings for All Current Quantified Activities (MG) – Total quantified savings for all current conservation activities and savings from water loss reduction.

Over (Short) – The amount that the utility's total quantified savings for all current conservation activities (since 2012), including water loss reduction, is over or below the volume represented by reductions in GPCD each year. If the quantified savings are less than these target volumes, the value will appear in parentheses.

Table 3-2. Utility Water Conservation Plan Goals — Total GPCD.

Year #	Year	Utility Population	Total GPCD Goals	Annual Savings Goal with Reduction in GPCD (MG)	Total Savings for All Current Quantified Activities (MG)	Over (Short) (MG)
0	**Baseline**	-	180	0	0	0
1	2015	9,429	179	6	42	36
2	2016	9,524	177	11	141	130
3	2017	9,619	175	17	142	124
4	2018	9,713	174	23	142	119
5-year Goal	2019	9,808	172	29	142	113
6	2020	9,903	170	36	142	106
7	2021	9,938	168	43	142	100
8	2022	9,973	167	50	143	93
9	2023	10,007	165	56	143	87
10-year Goal	2024	10,042	163	63	143	80

[13] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for total GPCD from the utility's most recently submitted five-year water conservation plan was used.

3.3 Utility Water Conservation Plan Goals – Water Loss GPCD

Table 3-3 shows how Lamesa's most recent water loss audit compares with 5- and 10-year water loss goals in its water conservation plan. The following definitions pair with the column headers in Table 3-2.

Utility Population – Estimated utility service area population for the years indicated.

Water Loss GPCD Goals – Water loss GPCD goals start with the utility's baseline[14] for water loss GPCD and progress in subsequent years to match 5- and 10-year water loss goals indicated in a utility's five-year water conservation plan on file with the TWDB. The first five annual GPCD goals were developed by spreading the difference between the baseline and five-year goal evenly over five years. The second five annual GPCD goals spread the difference between the five-year goal and 10-year goal evenly over the next five years.

Yearly Savings Goal with Reduction in GPCD (MG) – This column shows what reductions from the baseline water loss GPCD would yield in terms of volume each year as more water is saved. The volumes indicated here are what target water loss GPCD goals look like expressed in million gallons. Annual volumes were derived using the formula: (baseline water loss GPCD – target water loss GPCD for that year) x 365 days ÷ 1,000,000 gallons.

Total Savings from Water Loss Reduction (MG) – The difference between a utility's established baseline for water loss GPCD and the most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB. If water loss GPCD has increased from the utility's baseline to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount. Reference Table 5-1 for savings from water loss reduction.

Over (Short) – The amount that the utility's total savings from water loss reduction is over or below the volume represented by reductions in GPCD each year. If water loss reduction savings are less than these target volumes, the value will appear in parentheses.

Table 3-3. Utility Water Conservation Plan Goals — Water Loss GPCD.

Year #	Year	Utility Population	Water Loss GPCD Goals	Yearly Savings Goal with Reduction in GPCD (MG)	Total Savings from Water Loss Reduction (MG)	Over (Short) (MG)
0	**Baseline**	-	12.00	0	0	0
1	2015	9,429	11.80	1	3.44	3
2	2016	9,524	11.60	1	3.48	2
3	2017	9,619	11.40	2	3.51	1
4	2018	9,713	11.20	3	3.55	1
5-year Goal	2019	9,808	11.00	4	3.58	(0)
6	2020	9,903	10.80	4	3.61	(1)
7	2021	9,938	10.60	5	3.63	(1)
8	2022	9,973	10.40	6	3.64	(2)
9	2023	10,007	10.20	7	3.65	(3)
10-year Goal	2024	10,042	10.00	7	3.67	(4)

[14] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.

4 Implemented Activities

Below is a list of completed activities with estimated water savings. Note that drought response and other measures are not included in the utility's water savings because they are temporary, awareness-based or not able to be accurately quantified on an annual basis.

These are not savings projections of potential future activities. Estimated savings are based on measures that have actually been implemented. If savings are shown to persist in future years, it is because the measure is permanent, such as an ordinance, or the savings are assumed to continue for the reason listed under the itemized activity. Estimated savings from water rate increases are the one exception to these conditions.

Water Rate Increases

Savings from water rate increases were included because entities such as the U.S. Environmental Protection Agency and others indicate specific savings for utilities that raise rates (Texas Water Development Board, 2013; U.S. E.P.A., 1998; Whitcomb, 1999). This project includes surveys of several utilities that have minimal education efforts, perform no other substantive conservation activities, and yet experienced significant demand reduction that coincided with rate increases. In those cases, savings estimates matched up closely with decreases in total GPCD. For many smaller utilities, especially those with customers lacking disposable income, this measure is the only tool used to conserve other than water loss reduction.

The following assumptions were made for water rate increases:

- The model assumes that savings persist into future years because it is expected that the utility will continue to make periodic rate increases in line with the percentage increases from previous years.
- Only the last two rate increases for a utility were quantified.
- Savings grow with demand because as new customers enter the service area, they are assumed to adhere to the same price elasticity model estimates.
- A weighted average for savings was used when rate increases differed between residential and industrial-commercial-institutional (ICI) customers based on the individual utility's customer class breakdown.
- When a utility raised rates using tiered rate conservation pricing, a 50/50 savings split was used when increases differed between base and volumetric rates.
    - The reasoning is that all customers must react to the base increase, yet the pricing signal is stronger when volumetric rate increases affect the higher usage customers.
    - The 50/50 split is reasonable because many customers will not reach the higher volumetric tiers.
    - Studies show that most customers do not actually know they have reached the higher volumetric tiers; just that their bill has increased (Texas Water Development Board, 2013).

4.1 Itemized Activities

1. **Utility Website**
    a. Easy-to-use website with conservation tips and water rates
    b. Features contact information for Public Works staff and customer service

2. **Continuing Public Education**
    a. The utility engages the public in many ways including:
        i. Brochures, bill messages, displays, and exhibits

3. **Water Loss Reduction Savings**[15]
    a. Savings of 3.44 MG annually in 2015
    b. Water loss reduction savings = the difference between a utility's baseline[16] water loss GPCD submitted in its most recent 5-year water conservation plan and its most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB
    c. If water loss GPCD has increased from the utility's baseline or historic 5-year average to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount.
    d. All savings estimates grow each year at the same rate population figures for the utility grow in the regional water plan.

4. **Water Rate Increases**
    a. Last rate increases:[17]
        i. 26.2% increase in 2014
        ii. 67.5% increase in 2016
    b. Estimated customer demand reduction of 18.7%
    c. Savings is cumulative and based on more than one source[18] (U.S. EPA, 1998; Whitcomb, 1999)
    d. Savings from rate increases are shown to persist over time, however, note that savings from these pricing signals will likely decrease if rates remain the same in future years.

5. **Automatic Meter Reading (AMR)/Advanced Metering Infrastructure (AMI)**
    a. These metering systems can save water in a number of ways, including from water loss reduction through improved leak detection.
    b. All water loss reduction savings associated with this activity are detailed in Section 5, which assessed utility baseline water loss GPCD and most recently reported water loss GPCD to determine water savings.

---

[15] If current water loss levels exceed a utility's baseline, this value is treated as a deduction from total quantified savings.
[16] In the absence of having a baseline figure provided in the utility's most recently submitted 5-year water conservation plan, the historic 5-year average for water loss GPCD in the plan was used.
[17] Correspondence with utility staff.
[18] The study estimates a 2% demand reduction with 10% increase in price on a targeted customer class. By applying a ratio, it is possible to determine the savings for lower or higher percentage increases.

c. For estimated water savings that could be increased by implementing meter data management (MDM) and customer engagement portal applications, refer to Section 6 of this report.
    i. With these additional applications, water savings can be achieved through changed customer behavior and other real-time actions that go beyond water loss reduction.

5 Summary of Savings

Table 5-2. Savings from Water Loss Reduction (MG).

Year	Utility Population	Water Loss GPCD	Total Savings from Water Loss Reduction (MG)
Baseline	-	12.00	0
2015	9,427	11.00	3.44
2016	9,522	11.00	3.48
2017	9,617	11.00	3.51
2018	9,713	11.00	3.55
2019	9,808	11.00	3.58
2020	9,903	11.00	3.61
2021	9,938	11.00	3.63
2022	9,973	11.00	3.64
2023	10,007	11.00	3.65
2024	10,042	11.00	3.67

6 Suggested Activities

Up to four activities were chosen as potential suggested activities for individual reports. These activities are: AMI system with customer portal, twice-per-week (or less) outdoor watering ordinances, strategic water rate increases, and rain barrels.

Activities were chosen because they are:

- Achievable
- Prevalence of vendors that can actually implement them
- Acceptability to city councils, MUD boards, et al.
- Easily adopted
- Cost effective
- Yield high savings relative to cost

AMI systems with customer engagement portals were also chosen because they represent a profusion of future applications that will undoubtedly continue to advance conservation efforts. AMI and meter data management (MDM) companies are developing new and innovative ways to benefit water providers, customers, and ultimately states that are pushing conservation and usage analytics further.

Each utility should be cognizant of the potential impact that these suggested activities may have on its own unique rate and revenue situation.

Benefits to consider:

- Avoided water supply and wastewater costs
    - The higher water purchase, transmission, and distribution costs are, the greater the potential benefit realized when large amounts of water are conserved with these activities.
- Avoided system expansion costs

- Conserving water may allow a utility to postpone building new system capacity by decreasing demand even as population grows.

Costs to consider:

- Staff time and resources
- Unit cost per unit saved
- Implementation costs
- Stakeholder agreement and support
- Other overhead and budget considerations

6.1 Suggested Activities with Savings Estimates

1. Twice-a-week Outdoor Watering Restriction Ordinance

a. Potentially 8.42% savings of total demand (Hermitte and Mace, 2012; Sierra Club-Lone Star Chapter and National Wildlife Federation, 2015)

i. Average Region O savings

ii. Specific percentage of outdoor usage unknown for your utility at this time

b. Savings could be 62 MG per year with current demand.

c. See Table 6-1 for potential savings from this measure compared with the city's WMS supply volumes targets.

Table 6-1. Current Savings + Potential Savings from 2x per Week Watering Ordinance (MG).

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Potential Savings from Ordinance	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)
2016	138	3	141	62	21	0	21	183
2017	138	4	142	62	21	0	21	183
2018	138	4	142	62	25	0	25	179
2019	138	4	142	62	29	0	29	176
2020	139	4	142	62	37	0	37	168
2021	139	4	142	63	37	0	37	168
2022	139	4	143	63	37	0	37	168
2023	139	4	143	63	37	0	37	168
2024	139	4	143	63	37	0	37	168
2025	139	4	143	63	37	0	37	169
2026	140	4	143	63	37	0	37	169
2027	140	4	144	63	37	0	37	169
2028	140	4	144	63	37	0	37	169
2029	140	4	144	63	37	0	37	170
2030	140	4	144	63	37	0	37	170
2031	140	4	144	63	38	0	38	170
2032	140	4	144	63	38	0	38	170
2033	141	4	144	63	38	0	38	170
2034	141	4	144	63	38	0	38	170
2035	141	4	144	63	38	0	38	170
2036	141	4	145	63	38	0	38	170
2037	141	4	145	63	38	0	38	170
2038	141	4	145	63	38	0	38	170
2039	141	4	145	63	38	0	38	170
2040	141	4	145	63	38	0	38	171

2. Advanced Metering Infrastructure with Customer Engagement Portal

These portals, along with mobile applications and billing statements, can provide customers with much more access to their water use data in simple and compelling formats. This access and comparison with other customers' usage can reduce water use through changed behavior, as well as provide an opportunity for other conservation programs to be offered to the customer for increased adoption and additional savings. AMI systems support leak notification and web portals with real-time data. Any water loss reduction savings that these systems also yield were included in the water loss assessment of individual reports for this project.

- **a.** Specific utility results will vary based on portal features and frequency of customer notifications.
- **b.** Potential savings estimate assumes 20% of residential customers will use and save water due to the portal (Westin Engineering, 2015)
- **c.** Estimate assumes customers will save 10% of total annual use due to the portal
    - i. Savings estimate of 10% is an average of results from multiple studies (Chesnutt and Mitchell, 2013; East Bay Municipal Utility District, 2014; IBM, 2011; Texas A&M and Texas Water Resources Institute, 2016; Westin Engineering, 2015)
- **d.** Residential customers' use assumed to make up approximately 67% of all retail customers' use based on utility profile information submitted to the TWDB
    - i. This was the most common percentage of residential use among participating utilities in this project.
    - ii. Actual customer class demand percentages will vary by utility.
- **e.** 20% of residential customers saving 10% with this customer class breakdown amounts to 1.34% of total demand
- **f.** Savings are assumed to increase along with demand as connections increase each year.[19]
- **g.** See Table 6-2 for potential savings from this measure compared with the utility's WMS supply volumes targets.

Table 6-2. Current Savings + Potential Savings from AMI with Customer Portal (MG).

[19] The 10% consumption reduction figure for 20% of residential customers is conservative, but savings could be greater when monitored yearly as customer engagement increases.

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Potential Savings from AMI with Customer Portal	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)
2016	138	3	141	10	21	0	21	131
2017	138	4	142	10	21	0	21	131

Statewide Water Conservation Quantification Project
City of Levelland Report • 2017

1 Introduction

In Texas' 2017 State Water Plan, municipal water conservation is projected to meet 9.6 percent[1] of the state's future water needs by 2070. According to the 16 regional water plans that comprise the state water plan, this is expected to be achieved through a variety of measures such as installation of water efficient plumbing fixtures, water conservation pricing structures, water system audits, landscape irrigation ordinances, as well as other water conservation activities. The 9.6 percent is "in addition to the estimated share of future passive conservation savings from plumbing codes and water efficiency standards, which are embedded in municipal water demand projections" (Texas Water Development Board, 2017).

In 2015, the Texas Legislature appropriated funds to the Texas Water Development Board (TWDB) to fund a research project principally charged with quantitatively determining the savings of municipal water conservation activities being implemented in relation to the recommended conservation goals (supply volumes) in the State Water Plan. As part of the project, individual reports were completed for all participating utilities.

With this report, utilities will benefit by receiving a clear and concise picture of its water conservation goals alongside estimated savings from quantifiable activities. In the event that current activity savings may not be able to reach long-term goals, this report offers suggestions on how utilities can reach water conservation goals with activities that are effective, easily adopted, have widespread appeal, and are quantifiable.

2 Municipal Conservation Terminology and Review of Methodology Used by Regional Planners

To make use of the results of this study, it is important to understand several key terms used in the water planning process.

What is a water user group?

In this report, a water user group (WUG) refers to a retail water provider in the form a city, municipal utility district, water control and improvement district, special utility district, water supply corporation, fresh water supply district, or other type of water utility. The TWDB further defines WUGs as one of the following (Texas Water Development Board, 2016b):

- Cities and towns with a population of 500 or more
- Non-city utilities providing more than 280 acre-feet per year per year of water for municipal use
- Collective reporting units (CRUs) consisting of grouped utilities having a common association

[1] Equal to 811,224 acre-feet per year in conservation savings.

- County-Wide WUGs:
    - County-Other (Rural/unincorporated areas of municipal water use)
    - Manufacturing
    - Steam electric power generation

What is a recommended water management strategy?

A recommended water management strategy (WMS) is a measure that will help ensure WUGs have adequate water supplies for their end users well into the future. WMS examples include river diversions, groundwater use, reservoir and aquifer development, and irrigation conservation. When WMS is referred to in this report, it refers only to municipal conservation, which may include water loss reduction as a part of the same strategy.

What is a WMS supply volume?

A WMS supply volume is the amount of water that a given strategy is expected to yield each decade in the planning period if carried out by the WUG. In this report, a WMS supply volume is the amount of water recommended to come from municipal water conservation.

Some regional water plans separate this strategy's supply volume into a volume for municipal water conservation and a volume for water loss reduction for each decade. The total strategy supply volume is the sum of both. A regional water plan may also refer to "advanced conservation" as part of this strategy. Advanced conservation usually indicates that the volume could be achieved through a more robust mix of conservation activities described in the plan.

2.1 Regional Planning Group Approach to Determining Supply Volumes

Each regional water planning group (RWPG) is responsible for producing its own individual plan that, if executed, will provide sufficient water to its WUGs throughout a 50-year planning period. These plans are completed in five-year cycles, with the most recent edition being completed in 2016. The 2016 regional plans make up the 2017 State Water Plan, which sets out WMS supply volumes for the years 2020 through 2070.

The decadal WMS supply volumes for municipal conservation were established by each of the RWPGs in much the same manner. The RWPGs generally followed the guidelines of the Texas Legislature's Water Conservation Implementation Task Force on the pace utilities should target to reduce gallons per capita per day (GPCD)[2] consumption levels.

The targeted reductions used by most regions follow this formula:

- For municipal WUGs with water use of 140 GPCD and greater, the goal is to reduce per capita water use by one percent per year until the level of 140 GPCD is reached,

[2] Regional water planning GPCD is defined as the annual volume of water pumped, diverted, or purchased minus the volume exported (sold) to other water systems or large industrial facilities divided by the permanent resident population of the Municipal Water User Group in the regional water planning process divided by 365. Saline and reused/recycled water are not included in this volume (Texas Water Development Board, 2012).

after which, the goal is to reduce per capita water use by one-fourth percent per year for the remainder of the planning period (Texas Water Development Board, 2016j).

The yearly reductions in GPCD for a given WUG are then converted into recommended supply volumes in acre-feet per year for each decade as the reductions in consumption continue. Some regions reduce GPCD by slightly different percentages before and after the 140 GPCD threshold, some do not apply further reductions in GPCD for WUGs once they reach 140 GPCD, while others recommend only "advanced conservation" activities once WUGs meet 140 GPCD.

2.2 Methodology

In order to complete a uniform quantification process, the first engagement was with utilities that agreed to participate and collected as much relevant data as possible. These data included, among many others, historical GPCD consumption figures, advanced metering infrastructure (AMI) specifications, and detailed feedback on each conservation activity being implemented. Personal interviews focused on determining when and to what extent these activities were being employed, as well as assessing plans to continue such conservation. Examples of frequently implemented activities include tiered water rate conservation pricing, strategic water rate increases, outdoor irrigation audits and ordinances, and rain barrel distribution.

Subsequently, each utility's conservation activities were quantified through several different means, including evidence-based studies, utility field results and savings determinations, manufacturer guarantees, water loss audits, TWDB studies, and other information that assigned a savings value to the activity's implementation.

Every conservation activity studied and quantified has a gallons-per-year estimate, useful life, and decay rate (if applicable) associated with it. Some activities' savings are projected to grow as demand grows over time, while some savings are constant each year and subside once useful life has run its course. For expanded methodology and details on studies and formulas used to determine activity savings, refer to Section 6 of the State Report included as part of this document.

Once analyzed, the resulting savings estimates from each utility were compared with the recommended WMS supply volumes in its respective regional plan to determine if the savings met, exceeded, or fell short of those volumes. Individual utility savings were aggregated to compare with regional volumes, and regional savings were aggregated to compare with state volumes.

It is important to note that this report quantified activity savings—not including water loss reduction—for the WMS supply volume comparison dating back to 2012. The reason for this is, with a few exceptions, the regional planners used 2011 as the base year for establishing potential WMS supply volumes.[3] In addition, any conservation savings achieved through 2011 are assumed to be accounted for in the regional water planning GPCD for that year.[4] Thus, quantifying from 2012 and forward is the most accurate way to determine if utilities are meeting

[3] Confirmed via personal communication with Region C, H, K, and L Plan consultants.
[4] It was established with TWDB planning staff that 2011 GPCD levels were chosen because they represented the most current water use and conservation patterns at the time.

the recommended conservation volumes in the regional plans. This assumption is by no means 100 percent accurate, however. Some previously implemented activities' savings persist into future years beyond this starting point, while some activities' savings have ceased. One year's GPCD will not necessarily include all savings yielded by conservation activities that came before it, but the quantification assessment must have a starting point.

2.3 Quantifiable Savings

The key to the project being useful and reliable is that the results from year to year are measurable. Quantifying conservation activities that can be accurately measured provides greater certainty and better planning for all stakeholders.

While many utilities are engaged in a variety of conservation activities, not all can currently be properly measured. Some examples of these activities include education initiatives, website and social media engagement, and enforcement for water waste. That does not mean these measures are not essential. Education of consumers, for example, is a fundamental activity that makes all others effective, but little hard data exists to quantify the results of education alone.

In addition, the work of conservation coordinators can have a particularly significant effect on the savings of all other activities, but the specific savings attributed to that staff role is difficult to quantify.

3 Results

This report compares Levelland's current water conservation activities and their quantified savings to two metrics: 1) Region O Water Plan's (Texas Water Development Board, 2016m) recommended WMS supply volumes for municipal conservation, and 2) Levelland's own five- and 10-year goals as established in its most recent water conservation plan submitted to the TWDB.

The WMS supply volumes for municipal water conservation are laid out by decade (2020 – 2070) in the regional water plans to serve as benchmarks for what each utility could achieve via that strategy during a 50-year planning period.[5]

The five- and 10-year goals in Levelland's most recent water conservation plan are established by the utility as realistic targets for reducing consumption over that timeframe. These reductions[6] are expressed in decreasing total GPCD [7] consumption and water loss GPCD.[8] [9]

The estimated savings in Tables 3-1 through 3-3 indicate the best information available as provided by utility staff. Some ongoing activities may not be known and are within a utility's

---

[5] Some regional water plans separate this strategy volume into a volume for water conservation and a volume for water loss reduction for each decade. The total strategy volume is the sum of both.

[6] Occasionally, some utilities expect consumption to increase due to various reasons, such as an incoming industrial presence expected to raise consumption figures for the entire service area.

[7] As defined in TWDB water conservation annual reports: (Total Gallons in System ÷ Permanent Population) ÷ 365

[8] These plans also have targets for residential GPCD and water loss as a percentage (rather than GPCD), but this report does not address those goals.

[9] As defined in annual TWDB water loss audits: (Total Water Loss ÷ Permanent Population) ÷ 365

service area are implemented on a micro-scale that may not be quantified. Individual households and businesses may be implementing conservation measures that are unknown and therefore cannot be included in the report.

Explanation of approach to assessing water loss reduction savings

Water loss reduction savings are defined as the volume of water participating utilities are realizing from their water loss mitigation efforts. For this report, this value is the difference between each individual utility's baseline[10] for water loss GPCD and its most recent water loss GPCD reported in 2015 water loss audits on file with TWDB. Savings from all water loss reduction efforts—including pipe replacements and leak repair—are assumed to be included in this comparison to a utility's baseline.

Note that because a single year (2015) value was used for comparison, it is possible that the 2015 value could be anomalous due to a number of events that may have occurred that year, such as a water main break, a particularly wet year, or a robust effort by the utility to curtail water loss. This will distort future savings figures that were carried forward in the study because water loss will inevitably increase or decrease in later years.

Ideally, using a rolling five-year average in the calculation would correct such anomalies. However, there was insufficient data to do that for every utility. The approach was to use the most complete water loss data possible, which was represented by the 2015 water loss audit. This problem will be further minimized, as continued data collection will allow five-year averages to be calculated for a majority of utilities.

In this way, water loss savings estimates are different from all other activity savings estimates in the project. Whether savings were positive or negative depended on where individual utilities established their own baselines or where their five-year average started, and what water loss GPCD value was reported in 2015.

3.1 Current Savings Compared to Conservation WMS Supply Volume (in million gallons) in Regional Water Plan

Table 3-1 shows the 2070 outlook for Levelland with the utility's yearly recommended WMS supply volume in million gallons (MG) alongside its water savings from implemented activities, including from water loss reduction. These activities and their associated savings are covered in greater detail in Sections 4 and 5.

Starting in 2015, this table compares all quantified conservation activity and the recommended conservation WMS supply volume for the planning period. The following definitions pair with the column headers in Table 3-1.

Actual Current Conservation Activity Savings – All quantified activities currently being performed by the utility, *excluding* savings from water loss reduction. The regional planners used 2011 GPCD as the baseline for determining future conservation WMS supply volumes, therefore

[10] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.

the study quantifies utility savings starting in 2012 for this comparison. The summary of these savings can be referenced in Table 5-1.

Actual Water Loss Reduction Savings (as of 2015) – The difference between the baseline[11] for water loss GPCD and most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB. [12] The summary of these savings can be referenced in Table 5-2.

Total Savings from All Conservation Activity – Actual Current Conservation Activity Savings plus Actual Water Loss Reduction Savings (as of 2015).

Conservation WMS Volume – The recommended municipal water conservation supply volume in the regional plan for the decades ranging from 2020 to 2070. These volumes are converted to MG from the values listed in the plan in acre-feet and then calculated in annual increments.

Water Loss Reduction WMS Volume – Some regional water plans have a separate WMS volume for water conservation and for water loss reduction for each decade. If a WUG's regional plan has a WMS volume for water loss reduction, this column will have values other than zero.

Total Yearly WMS Volume – The sum of the Conservation WMS Volume and Water Loss Reduction WMS Volume.

Over (Short) – The amount that the utility's Total Savings from All Conservation Activity (since 2012), is over or below the Total Yearly WMS Volume in the regional water plan. If the amount falls below the WMS volume, it will appear in parentheses.

[11] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.
[12] If water loss GPCD has increased from the utility's baseline or historic five-year average to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount.

Table 3-1. Current Savings Compared to Conservation WMS Supply Volume (MG) in Regional Water Plan.

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)
2015	4.7	(31)	(26)	17	0	17	(43)
2016	13.4	(31)	(18)	21	0	21	(39)

3.2 Utility Water Conservation Plan Goals – Total GPCD

Table 3-2 shows how Levelland's quantified savings from its implemented activities compare with 5- and 10-year goals established in its individual water conservation plan submitted to the TWDB. The following definitions pair with the column headers in Table 3-2.

Utility Population – Estimated utility service area population for the years indicated.

Total GPCD Goals – Total GPCD goals start with the utility's baseline[13] for total GPCD and progress in subsequent years to match 5- and 10-year goals indicated in a utility's five-year water conservation plan on file with the TWDB. The first five annual GPCD goals were developed by spreading the difference between the baseline and five-year goal evenly over five years. The second five annual GPCD goals spread the difference between the five-year goal and 10-year goal evenly over the next five years.

Annual Savings Goal with Reduction in GPCD (MG) – This column shows what reductions from the baseline GPCD would yield in terms of volume each year as more water is saved. The volumes indicated here are what target GPCD goals look like expressed in million gallons. Annual volumes were derived using the formula: (baseline total GPCD – target total GPCD for that year) x 365 days ÷ 1,000,000 gallons.

Total Savings for All Current Quantified Activities (MG) – Total quantified savings for all current conservation activities and savings from water loss reduction. Refer to Tables 5-1 and 5-2 for details on these savings.

Over (Short) – The amount that the utility's total quantified savings for all current conservation activities (since 2012), including water loss reduction, is over or below the volume represented by reductions in GPCD each year. If the quantified savings are less than these target volumes, the value will appear in parentheses.

Table 3-2. Utility Water Conservation Plan Goals — Total GPCD.

Year #	Year	Utility Population	Total GPCD Goals	Annual Savings Goal with Reduction in GPCD (MG)	Total Savings for All Current Quantified Activities (MG)	Over (Short) (MG)
0	**Baseline**	-	146	0	0	0
1	2015	13,929	146	2	(26)	(28)
2	2016	14,111	145	4	(18)	(22)
3	2017	14,293	145	6	(18)	(24)
4	2018	14,475	144	8	(18)	(27)
5-year Goal	2019	14,657	144	11	(19)	(29)
6	2020	14,839	144	12	(19)	(31)
7	2021	14,934	144	13	(19)	(32)
8	2022	15,028	143	14	(19)	(34)
9	2023	15,123	143	15	(19)	(35)
10-year Goal	2024	15,217	143	17	(20)	(36)

[13] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for total GPCD from the utility's most recently submitted five-year water conservation plan was used.

3.3 Utility Water Conservation Plan Goals – Water Loss GPCD

Table 3-3 shows how Levelland's most recent water loss audit compares with five- and 10-year water loss goals in its water conservation plan. The following definitions pair with the column headers in Table 3-2.

Utility Population – Estimated utility service area population for the years indicated.

Water Loss GPCD Goals – Water loss GPCD goals start with the utility's baseline[14] for water loss GPCD and progress in subsequent years to match 5- and 10-year water loss goals indicated in a utility's five-year water conservation plan on file with the TWDB. The first five annual GPCD goals were developed by spreading the difference between the baseline and five-year goal evenly over five years. The second five annual GPCD goals spread the difference between the five-year goal and 10-year goal evenly over the next five years.

Yearly Savings Goal with Reduction in GPCD (MG) – This column shows what reductions from the baseline water loss GPCD would yield in terms of volume each year as more water is saved. The volumes indicated here are what target water loss GPCD goals look like expressed in million gallons. Annual volumes were derived using the formula: (baseline water loss GPCD – target water loss GPCD for that year) x 365 days ÷ 1,000,000 gallons.

Total Savings from Water Loss Reduction (MG) – The difference between a utility's established baseline for water loss GPCD and the most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB. If water loss GPCD has increased from the utility's baseline to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount. Reference Table 5-2 for savings from water loss reduction.

Over (Short) – The amount that the utility's total savings from water loss reduction is over or below the volume represented by reductions in GPCD each year. If water loss reduction savings are less than these target volumes, the value will appear in parentheses.

Table 3-3. Utility Water Conservation Plan Goals — Water Loss GPCD.

Year #	Year	Utility Population	Water Loss GPCD Goals	Yearly Savings Goal with Reduction in GPCD (MG)	Total Savings from Water Loss Reduction (MG)	Over (Short) (MG)
0	**Baseline**	-	23.00	0	0	0
1	2015	13,929	22.80	1	(31)	(32)
2	2016	14,111	22.60	2	(31)	(33)
3	2017	14,293	22.40	3	(31)	(34)
4	2018	14,475	22.20	4	(32)	(36)
5-year Goal	2019	14,657	22.00	5	(32)	(37)
6	2020	14,839	21.80	6	(32)	(39)
7	2021	14,934	21.60	8	(33)	(40)
8	2022	15,028	21.40	9	(33)	(42)
9	2023	15,123	21.20	10	(33)	(43)
10-year Goal	2024	15,217	21.00	11	(33)	(44)

[14] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.

4 Implemented Activities

Below is a list of completed activities with estimated water savings. Note that drought response and other measures are not included in the utility's water savings because they are temporary, awareness-based or not able to be accurately quantified on an annual basis.

These are not savings projections of potential future activities. Estimated savings are based on measures that have actually been implemented. If savings are shown to persist in future years, it is because the measure is permanent, such as an ordinance, or the savings are assumed to continue for the reason listed under the itemized activity. Estimated savings from water rate increases are the one exception to these conditions.

Water Rate Increases

Savings from water rate increases were included because entities such as the U.S. Environmental Protection Agency and others indicate specific savings for utilities that raise rates (Texas Water Development Board, 2013; U.S. E.P.A., 1998; Whitcomb, 1999). This project includes surveys of several utilities that have minimal education efforts, perform no other substantive conservation activities, and yet experienced significant demand reduction that coincided with rate increases. In those cases, savings estimates matched up closely with decreases in total GPCD. For many smaller utilities, especially those with customers lacking disposable income, this measure is the only tool used to conserve other than water loss reduction.

The following assumptions were made for water rate increases:

- The model assumes that savings persist into future years because it is expected that the utility will continue to make periodic rate increases in line with the percentage increases from previous years.
- Only the last two rate increases for a utility were quantified.
- Savings grow with demand because as new customers enter the service area, they are assumed to adhere to the same price elasticity model estimates.
- A weighted average for savings was used when rate increases differed between residential and industrial-commercial-institutional (ICI) customers based on the individual utility's customer class breakdown.
- When a utility raised rates using tiered rate conservation pricing, a 50/50 savings split was used when increases differed between base and volumetric rates.
    - The reasoning is that all customers must react to the base increase, yet the pricing signal is stronger when volumetric rate increases affect the higher usage customers.
    - The 50/50 split is reasonable because many customers will not reach the higher volumetric tiers.
    - Studies show that most customers do not actually know they have reached the higher volumetric tiers; just that their bill has increased (Texas Water Development Board, 2013).

4.1 Itemized Activities

1. **Utility Website**
    a. Easy-to-use website with conservation tips and water rates
    b. Features contact information for Public Works staff and customer service

2. **Continuing Public Education**
    a. The utility engages the public in many ways including:
        i. Brochures, bill messages, displays, and exhibits

3. **Water Loss Reduction Savings**[15]
    a. Loss of 31 MG annually in 2015
    b. Water loss reduction savings = the difference between a utility's baseline[16] water loss GPCD submitted in its most recent 5-year water conservation plan and its most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB
    c. If water loss GPCD has increased from the utility's baseline or historic 5-year average to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount.
    d. All savings estimates grow each year at the same rate population figures for the utility grow in the regional water plan.

4. **Water Rate Increases**
    a. Last rate increases:[17]
        i. 3.0% increase in 2014
        ii. 5.0% increase in 2016
    b. Estimated customer demand reduction of .8%
    c. Savings is cumulative and based on more than one source[18] (U.S. EPA, 1998; Whitcomb, 1999)
    d. Savings from rate increases are shown to persist over time, however, note that savings from these pricing signals will likely decrease if rates remain the same in future years.

5. **Automatic Meter Reading (AMR)/Advanced Metering Infrastructure (AMI)**
    a. These metering systems can save water in a number of ways, including from water loss reduction through improved leak detection.
    b. All water loss reduction savings associated with this activity are detailed in Section 5, which assessed utility baseline water loss GPCD and most recently reported water loss GPCD to determine water savings.

---

[15] If current water loss levels exceed a utility's baseline, this value is treated as a deduction from total quantified savings.
[16] In the absence of having a baseline figure provided in the utility's most recently submitted 5-year water conservation plan, the historic 5-year average for water loss GPCD in the plan was used.
[17] Correspondence with utility staff.
[18] The study estimates a 2% demand reduction with 10% increase in price on a targeted customer class. By applying a ratio, it is possible to determine the savings for lower or higher percentage increases.

c. For estimated water savings that could be increased by implementing meter data management (MDM) and customer engagement portal applications, refer to Section 6 of this report.
    i. With these additional applications, water savings can be achieved through changed customer behavior and other real-time actions that go beyond water loss reduction.

5 Summary of Savings

Table 5-1. Savings by Water Conservation Activity (MG).

Year	Water Rate Increase	TOTAL SAVINGS
2012		0
2013		0
2014	4.68	4.7
2015	4.70	4.7
2016	13.36	13.4
2017	13.40	13.4
2018	13.44	13.4
2019	13.49	13.5
2020	13.53	13.5
2021	13.58	13.6
2022	13.62	13.6
2023	13.66	13.7
2024	13.71	13.7
2025	13.75	13.8
2026	13.80	13.8
2027	13.84	13.8
2028	13.89	13.9
2029	13.93	13.9

6 Suggested Activities

Up to four activities were chosen as potential suggested activities for individual reports. These activities are: AMI system with customer portal, twice-per-week (or less) outdoor watering ordinances, strategic water rate increases, and rain barrels.

Activities were chosen because they are:

- Achievable
- Prevalence of vendors that can actually implement them
- Acceptability to city councils, MUD boards, et al.
- Easily adopted
- Cost effective
- Yield high savings relative to cost

AMI systems with customer engagement portals were also chosen because they represent a profusion of future applications that will undoubtedly continue to advance conservation efforts. AMI and meter data management (MDM) companies are developing new and innovative ways to benefit water providers, customers, and ultimately states that are pushing conservation and usage analytics further.

Each utility should be cognizant of the potential impact that these suggested activities may have on its own unique rate and revenue situation.

Benefits to consider:

- Avoided water supply and wastewater costs
  - The higher water purchase, transmission, and distribution costs are, the greater the potential benefit realized when large amounts of water are conserved with these activities.
- Avoided system expansion costs
  - Conserving water may allow a utility to postpone building new system capacity by decreasing demand even as population grows.

Costs to consider:

- Staff time and resources
- Unit cost per unit saved
- Implementation costs
- Stakeholder agreement and support
- Other overhead and budget considerations

6.1 Suggested Activities with Savings Estimates

1. Twice-a-week Outdoor Watering Restriction Ordinance
   a. Potentially 8.42% savings of total demand (Hermitte and Mace, 2012; Sierra Club-Lone Star Chapter and National Wildlife Federation, 2015)
      i. Average Region O savings
      ii. Specific percentage of outdoor usage unknown for your utility at this time
   b. Savings could be 66 MG per year with current demand.
   c. See Table 6-1 for potential savings from this measure compared with the city's WMS supply volumes targets.

Table 6-1. Current Savings + Potential Savings from 2x per Week Watering Ordinance (MG).

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Potential Savings from Ordinance	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)
2016	13	(31)	(18)	66	21	0	21	28
2017	13	(31)	(18)	66	21	0	21	27
2018	13	(32)	(18)	67	25	0	25	23

2035	14	(35)	(21)	70	9	0	9	40
2036	14	(35)	(21)	70	7	0	7	42
2037	14	(35)	(21)	70	5	0	5	43
2038	14	(36)	(21)	70	3	0	3	45
2039	14	(36)	(22)	70	2	0	2	47
2040	14	(36)	(22)	70	0	0	0	48

2. Advanced Metering Infrastructure with Customer Engagement Portal

These portals, along with mobile applications and billing statements, can provide customers with much more access to their water use data in simple and compelling formats. This access and comparison with other customers' usage can reduce water use through changed behavior, as well as provide an opportunity for other conservation programs to be offered to the customer for increased adoption and additional savings. AMI systems support leak notification and web portals with real-time data. Any water loss reduction savings that these systems also yield were included in the water loss assessment of individual reports for this project.

- **a.** Specific utility results will vary based on portal features and frequency of customer notifications.
- **b.** Potential savings estimate assumes 20% of residential customers will use and save water due to the portal (Westin Engineering, 2015)
- **c.** Estimate assumes customers will save 10% of total annual use due to the portal
    - i. Savings estimate of 10% is an average of results from multiple studies (Chesnutt and Mitchell, 2013; East Bay Municipal Utility District, 2014; IBM, 2011; Texas A&M and Texas Water Resources Institute, 2016; Westin Engineering, 2015)
- **d.** Residential customers' use assumed to make up approximately 67% of all retail customers' use based on utility profile information submitted to the TWDB
    - i. This was the most common percentage of residential use among participating utilities in this project.
    - ii. Actual customer class demand percentages will vary by utility.
- **e.** 20% of residential customers saving 10% with this customer class breakdown amounts to 1.34% of total demand
- **f.** Savings are assumed to increase along with demand as connections increase each year.[19]
- **g.** See Table 6-2 for potential savings from this measure compared with the utility's WMS supply volumes targets.

[19] The 10% consumption reduction figure for 20% of residential customers is conservative, but savings could be greater when monitored yearly as customer engagement increases.

Table 6-2. Current Savings + Potential Savings from AMI with Customer Portal (MG).

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Potential Savings from AMI with Customer Portal	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)

Statewide Water Conservation Quantification Project
City of Lubbock Report • 2017

1 Introduction

In Texas' 2017 State Water Plan, municipal water conservation is projected to meet 9.6 percent[1] of the state's future water needs by 2070. According to the 16 regional water plans that comprise the state water plan, this is expected to be achieved through a variety of measures such as installation of water efficient plumbing fixtures, water conservation pricing structures, water system audits, landscape irrigation ordinances, as well as other water conservation activities. The 9.6 percent is "in addition to the estimated share of future passive conservation savings from plumbing codes and water efficiency standards, which are embedded in municipal water demand projections" (Texas Water Development Board, 2017).

In 2015, the Texas Legislature appropriated funds to the Texas Water Development Board (TWDB) to fund a research project principally charged with quantitatively determining the savings of municipal water conservation activities being implemented in relation to the recommended conservation goals (supply volumes) in the State Water Plan. As part of the project, individual reports were completed for all participating utilities.

With this report, utilities will benefit by receiving a clear and concise picture of its water conservation goals alongside estimated savings from quantifiable activities. In the event that current activity savings may not be able to reach long-term goals, this report offers suggestions on how utilities can reach water conservation goals with activities that are effective, easily adopted, have widespread appeal, and are quantifiable.

2 Municipal Conservation Terminology and Review of Methodology Used by Regional Planners

To make use of the results of this study, it is important to understand several key terms used in the water planning process.

What is a water user group?

In this report, a water user group (WUG) refers to a retail water provider in the form a city, municipal utility district, water control and improvement district, special utility district, water supply corporation, fresh water supply district, or other type of water utility. The TWDB further defines WUGs as one of the following (Texas Water Development Board, 2016b):

- Cities and towns with a population of 500 or more
- Non-city utilities providing more than 280 acre-feet per year per year of water for municipal use
- Collective reporting units (CRUs) consisting of grouped utilities having a common association

[1] Equal to 811,224 acre-feet per year in conservation savings.

- County-Wide WUGs:
  - County-Other (Rural/unincorporated areas of municipal water use)
  - Manufacturing
  - Steam electric power generation

What is a recommended water management strategy?

A recommended water management strategy (WMS) is a measure that will help ensure WUGs have adequate water supplies for their end users well into the future. WMS examples include river diversions, groundwater use, reservoir and aquifer development, and irrigation conservation. When WMS is referred to in this report, it refers only to municipal conservation, which may include water loss reduction as a part of the same strategy.

What is a WMS supply volume?

A WMS supply volume is the amount of water that a given strategy is expected to yield each decade in the planning period if carried out by the WUG. In this report, a WMS supply volume is the amount of water recommended to come from municipal water conservation.

Some regional water plans separate this strategy's supply volume into a volume for municipal water conservation and a volume for water loss reduction for each decade. The total strategy supply volume is the sum of both. A regional water plan may also refer to "advanced conservation" as part of this strategy. Advanced conservation usually indicates that the volume could be achieved through a more robust mix of conservation activities described in the plan.

2.1 Regional Planning Group Approach to Determining Supply Volumes

Each regional water planning group (RWPG) is responsible for producing its own individual plan that, if executed, will provide sufficient water to its WUGs throughout a 50-year planning period. These plans are completed in five-year cycles, with the most recent edition being completed in 2016. The 2016 regional plans make up the 2017 State Water Plan, which sets out WMS supply volumes for the years 2020 through 2070.

The decadal WMS supply volumes for municipal conservation were established by each of the RWPGs in much the same manner. The RWPGs generally followed the guidelines of the Texas Legislature's Water Conservation Implementation Task Force on the pace utilities should target to reduce gallons per capita per day (GPCD)[2] consumption levels.

The targeted reductions used by most regions follow this formula:

- For municipal WUGs with water use of 140 GPCD and greater, the goal is to reduce per capita water use by one percent per year until the level of 140 GPCD is reached,

[2] Regional water planning GPCD is defined as the annual volume of water pumped, diverted, or purchased minus the volume exported (sold) to other water systems or large industrial facilities divided by the permanent resident population of the Municipal Water User Group in the regional water planning process divided by 365. Saline and reused/recycled water are not included in this volume (Texas Water Development Board, 2012).

after which, the goal is to reduce per capita water use by one-fourth percent per year for the remainder of the planning period (Texas Water Development Board, 2016j).

The yearly reductions in GPCD for a given WUG are then converted into recommended supply volumes in acre-feet per year for each decade as the reductions in consumption continue. Some regions reduce GPCD by slightly different percentages before and after the 140 GPCD threshold, some do not apply further reductions in GPCD for WUGs once they reach 140 GPCD, while others recommend only "advanced conservation" activities once WUGs meet 140 GPCD.

2.2 Methodology

In order to complete a uniform quantification process, the first engagement was with utilities that agreed to participate and collected as much relevant data as possible. These data included, among many others, historical GPCD consumption figures, advanced metering infrastructure (AMI) specifications, and detailed feedback on each conservation activity being implemented. Personal interviews focused on determining when and to what extent these activities were being employed, as well as assessing plans to continue such conservation. Examples of frequently implemented activities include tiered water rate conservation pricing, strategic water rate increases, outdoor irrigation audits and ordinances, and rain barrel distribution.

Subsequently, each utility's conservation activities were quantified through several different means, including evidence-based studies, utility field results and savings determinations, manufacturer guarantees, water loss audits, TWDB studies, and other information that assigned a savings value to the activity's implementation.

Every conservation activity studied and quantified has a gallons-per-year estimate, useful life, and decay rate (if applicable) associated with it. Some activities' savings are projected to grow as demand grows over time, while some savings are constant each year and subside once useful life has run its course. For expanded methodology and details on studies and formulas used to determine activity savings, refer to Section 6 of the State Report included as part of this document.

Once analyzed, the resulting savings estimates from each utility were compared with the recommended WMS supply volumes in its respective regional plan to determine if the savings met, exceeded, or fell short of those volumes. Individual utility savings were aggregated to compare with regional volumes, and regional savings were aggregated to compare with state volumes.

It is important to note that this report quantified activity savings—not including water loss reduction—for the WMS supply volume comparison dating back to 2012. The reason for this is, with a few exceptions, the regional planners used 2011 as the base year for establishing potential WMS supply volumes.[3] In addition, any conservation savings achieved through 2011 are assumed to be accounted for in the regional water planning GPCD for that year.[4] Thus, quantifying from 2012 and forward is the most accurate way to determine if utilities are meeting

[3] Confirmed via personal communication with Region C, H, K, and L Plan consultants.
[4] It was established with TWDB planning staff that 2011 GPCD levels were chosen because they represented the most current water use and conservation patterns at the time.

the recommended conservation volumes in the regional plans. This assumption is by no means 100 percent accurate, however. Some previously implemented activities' savings persist into future years beyond this starting point, while some activities' savings have ceased. One year's GPCD will not necessarily include all savings yielded by conservation activities that came before it, but the quantification assessment must have a starting point.

2.3 Quantifiable Savings

The key to the project being useful and reliable is that the results from year to year are measurable. Quantifying conservation activities that can be accurately measured provides greater certainty and better planning for all stakeholders.

While many utilities are engaged in a variety of conservation activities, not all can currently be properly measured. Some examples of these activities include education initiatives, website and social media engagement, and enforcement for water waste. That does not mean these measures are not essential. Education of consumers, for example, is a fundamental activity that makes all others effective, but little hard data exists to quantify the results of education alone.

In addition, the work of conservation coordinators can have a particularly significant effect on the savings of all other activities, but the specific savings attributed to that staff role is difficult to quantify.

3 Results

This report compares Lubbock's current water conservation activities and their quantified savings to two metrics: 1) Region O Water Plan's (Texas Water Development Board, 2016m) recommended WMS supply volumes for municipal conservation, and 2) Lubbock's own five- and 10-year goals as established in its most recent water conservation plan submitted to the TWDB.

The WMS supply volumes for municipal water conservation are laid out by decade (2020 – 2070) in the regional water plans to serve as benchmarks for what each utility could achieve via that strategy during a 50-year planning period.[5]

The five- and 10-year goals in Lubbock's most recent water conservation plan are established by the utility as realistic targets for reducing consumption over that timeframe. These reductions[6] are expressed in decreasing total GPCD [7] consumption and water loss GPCD.[8 9]

The estimated savings in Tables 3-1 through 3-3 indicate the best information available as provided by utility staff. Some ongoing activities may not be known and are within a utility's

[5] Some regional water plans separate this strategy volume into a volume for water conservation and a volume for water loss reduction for each decade. The total strategy volume is the sum of both.
[6] Occasionally, some utilities expect consumption to increase due to various reasons, such as an incoming industrial presence expected to raise consumption figures for the entire service area.
[7] As defined in TWDB water conservation annual reports: (Total Gallons in System ÷ Permanent Population) ÷ 365
[8] These plans also have targets for residential GPCD and water loss as a percentage (rather than GPCD), but this report does not address those goals.
[9] As defined in annual TWDB water loss audits: (Total Water Loss ÷ Permanent Population) ÷ 365

service area are implemented on a micro-scale that may not be quantified. Individual households and businesses may be implementing conservation measures that are unknown and therefore cannot be included in the report.

Explanation of approach to assessing water loss reduction savings

Water loss reduction savings are defined as the volume of water participating utilities are realizing from their water loss mitigation efforts. For this report, this value is the difference between each individual utility's baseline[10] for water loss GPCD and its most recent water loss GPCD reported in 2015 water loss audits on file with TWDB. Savings from all water loss reduction efforts—including pipe replacements and leak repair—are assumed to be included in this comparison to a utility's baseline.

Note that because a single year (2015) value was used for comparison, it is possible that the 2015 value could be anomalous due to a number of events that may have occurred that year, such as a water main break, a particularly wet year, or a robust effort by the utility to curtail water loss. This will distort future savings figures that were carried forward in the study because water loss will inevitably increase or decrease in later years.

Ideally, using a rolling five-year average in the calculation would correct such anomalies. However, there was insufficient data to do that for every utility. The approach was to use the most complete water loss data possible, which was represented by the 2015 water loss audit. This problem will be further minimized, as continued data collection will allow five-year averages to be calculated for a majority of utilities.

In this way, water loss savings estimates are different from all other activity savings estimates in the project. Whether savings were positive or negative depended on where individual utilities established their own baselines or where their five-year average started, and what water loss GPCD value was reported in 2015.

3.1 Current Savings Compared to Conservation WMS Supply Volume (in million gallons) in Regional Water Plan

Table 3-1 shows the 2070 outlook for Lubbock with the utility's yearly recommended WMS supply volume in million gallons (MG) alongside its water savings from implemented activities, including from water loss reduction. These activities and their associated savings are covered in greater detail in Sections 4 and 5.

Starting in 2015, this table compares all quantified conservation activity and the recommended conservation WMS supply volume for the planning period. The following definitions pair with the column headers in Table 3-1.

<u>Actual Current Conservation Activity Savings</u> – All quantified activities currently being performed by the utility, *excluding* savings from water loss reduction. The regional planners used 2011 GPCD as the baseline for determining future conservation WMS supply volumes, therefore

[10] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.

the study quantifies utility savings starting in 2012 for this comparison. The summary of these savings can be referenced in Table 5-1.

Actual Water Loss Reduction Savings (as of 2015) – The difference between the baseline[11] for water loss GPCD and most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB. [12] The summary of these savings can be referenced in Table 5-2.

Total Savings from All Conservation Activity – Actual Current Conservation Activity Savings plus Actual Water Loss Reduction Savings (as of 2015).

Conservation WMS Volume – The recommended municipal water conservation supply volume in the regional plan for the decades ranging from 2020 to 2070. These volumes are converted to MG from the values listed in the plan in acre-feet and then calculated in annual increments.

Water Loss Reduction WMS Volume – Some regional water plans have a separate WMS volume for water conservation and for water loss reduction for each decade. If a WUG's regional plan has a WMS volume for water loss reduction, this column will have values other than zero.

Total Yearly WMS Volume – The sum of the Conservation WMS Volume and Water Loss Reduction WMS Volume.

Over (Short) – The amount that the utility's Total Savings from All Conservation Activity (since 2012), is over or below the Total Yearly WMS Volume in the regional water plan. If the amount falls below the WMS volume, it will appear in parentheses.

[11] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.

[12] If water loss GPCD has increased from the utility's baseline or historic five-year average to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount.

Table 3-1. Current Savings Compared to Conservation WMS Supply Volume (MG) in Regional Water Plan.

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)
2015	85	364	449	331	0	331	118
2016	87	365	452	414	0	414	38
2017	1,217	367	1,585	414	0	414	1,171
2018	1,228	369	1,597	497	0	497	1,100
2019	1,238	371	1,609	580	0	580	1,029
2020	1,248	373	1,621	745	0	745	875
2021	1,258	377	1,635	752	0	752	883
2022	1,268	381	1,649	758	0	758	891
2023	1,279	385	1,664	764	0	764	900
2024	1,289	389	1,678	770	0	770	908
2025	1,299	393	1,693	776	0	776	916
2026	1,310	398	1,707	783	0	783	925
2027	1,320	402	1,722	789	0	789	933

3.2 Utility Water Conservation Plan Goals – Total GPCD

Table 3-2 shows how Lubbock's quantified savings from its implemented activities compare with 5- and 10-year goals established in its individual water conservation plan submitted to the TWDB. The following definitions pair with the column headers in Table 3-2.

Utility Population – Estimated utility service area population for the years indicated.

Total GPCD Goals – Total GPCD goals start with the utility's baseline[13] for total GPCD and progress in subsequent years to match 5- and 10-year goals indicated in a utility's five-year water conservation plan on file with the TWDB. The first five annual GPCD goals were developed by spreading the difference between the baseline and five-year goal evenly over five years. The second five annual GPCD goals spread the difference between the five-year goal and 10-year goal evenly over the next five years.

Annual Savings Goal with Reduction in GPCD (MG) – This column shows what reductions from the baseline GPCD would yield in terms of volume each year as more water is saved. The volumes indicated here are what target GPCD goals look like expressed in million gallons. Annual volumes were derived using the formula: (baseline total GPCD – target total GPCD for that year) x 365 days ÷ 1,000,000 gallons.

Total Savings for All Current Quantified Activities (MG) – Total quantified savings for all current conservation activities and savings from water loss reduction. Refer to Tables 5-1 and 5-2 for details on these savings.

Over (Short) – The amount that the utility's total quantified savings for all current conservation activities (since 2012), including water loss reduction, is over or below the volume represented by reductions in GPCD each year. If the quantified savings are less than these target volumes, the value will appear in parentheses.

Table 3-2. Utility Water Conservation Plan Goals — Total GPCD.

Year #	Year	Utility Population	Total GPCD Goals	Annual Savings Goal with Reduction in GPCD (MG)	Total Savings for All Current Quantified Activities (MG)	Over (Short) (MG)
0	**Baseline**	-	153	0	0	0
1	2015	249,042	152	73	449	376
2	2016	250,285	151	146	452	306
3	2017	251,528	151	220	1,585	1,364
4	2018	252,771	150	295	1,597	1,301
5-year Goal	2019	254,014	149	371	1,609	1,238
6	2020	255,257	148	447	1,621	1,173
7	2021	258,091	147	528	1,635	1,107
8	2022	260,925	147	610	1,649	1,040
9	2023	263,759	146	693	1,664	971
10-year Goal	2024	266,593	145	778	1,678	900

[13] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for total GPCD from the utility's most recently submitted five-year water conservation plan was used.

3.3 Utility Water Conservation Plan Goals – Water Loss GPCD

Table 3-3 shows how Lubbock's most recent water loss audit compares with 5- and 10-year water loss goals in its water conservation plan. The following definitions pair with the column headers in Table 3-2.

Utility Population – Estimated utility service area population for the years indicated.

Water Loss GPCD Goals – Water loss GPCD goals start with the utility's baseline[14] for water loss GPCD and progress in subsequent years to match 5- and 10-year water loss goals indicated in a utility's five-year water conservation plan on file with the TWDB. The first five annual GPCD goals were developed by spreading the difference between the baseline and five-year goal evenly over five years. The second five annual GPCD goals spread the difference between the five-year goal and 10-year goal evenly over the next five years.

Yearly Savings Goal with Reduction in GPCD (MG) – This column shows what reductions from the baseline water loss GPCD would yield in terms of volume each year as more water is saved. The volumes indicated here are what target water loss GPCD goals look like expressed in million gallons. Annual volumes were derived using the formula: (baseline water loss GPCD – target water loss GPCD for that year) x 365 days ÷ 1,000,000 gallons.

Total Savings from Water Loss Reduction (MG) – The difference between a utility's established baseline for water loss GPCD and the most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB. If water loss GPCD has increased from the utility's baseline to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount. Reference Table 5-2 for savings from water loss reduction.

Over (Short) – The amount that the utility's total savings from water loss reduction is over or below the volume represented by reductions in GPCD each year. If water loss reduction savings are less than these target volumes, the value will appear in parentheses.

Table 3-3. Utility Water Conservation Plan Goals — Water Loss GPCD.

Year #	Year	Utility Population	Water Loss GPCD Goals	Yearly Savings Goal with Reduction in GPCD (MG)	Total Savings from Water Loss Reduction (MG)	Over (Short) (MG)
0	**Baseline**	-	15.00	0	0	0
1	2015	249,042	15.00	0	364	364
2	2016	250,285	15.00	0	365	365
3	2017	251,528	15.00	0	367	367
4	2018	252,771	15.00	0	369	369
5-year Goal	2019	254,014	15.00	0	371	371
6	2020	255,257	15.00	0	373	373
7	2021	258,091	15.00	0	377	377
8	2022	260,925	15.00	0	381	381
9	2023	263,759	15.00	0	385	385
10-year Goal	2024	266,593	15.00	0	389	389

[14] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.

4 Implemented Activities

Below is a list of completed activities with estimated water savings. Note that drought response and other measures are not included in the utility's water savings because they are temporary, awareness-based or not able to be accurately quantified on an annual basis.

These are not savings projections of potential future activities. Estimated savings are based on measures that have actually been implemented. If savings are shown to persist in future years, it is because the measure is permanent, such as an ordinance, or the savings are assumed to continue for the reason listed under the itemized activity. Estimated savings from water rate increases are the one exception to these conditions.

Water Rate Increases

Savings from water rate increases were included because entities such as the U.S. Environmental Protection Agency and others indicate specific savings for utilities that raise rates (Texas Water Development Board, 2013; U.S. E.P.A., 1998; Whitcomb, 1999). This project includes surveys of several utilities that have minimal education efforts, perform no other substantive conservation activities, and yet experienced significant demand reduction that coincided with rate increases. In those cases, savings estimates matched up closely with decreases in total GPCD. For many smaller utilities, especially those with customers lacking disposable income, this measure is the only tool used to conserve other than water loss reduction

The following assumptions were made for water rate increases:

- The model assumes that savings persist into future years because it is expected that the utility will continue to make periodic rate increases in line with the percentage increases from previous years.
- Only the last two rate increases for a utility were quantified.
- Savings grow with demand because as new customers enter the service area, they are assumed to adhere to the same price elasticity model estimates.
- A weighted average for savings was used when rate increases differed between residential and industrial-commercial-institutional (ICI) customers based on the individual utility's customer class breakdown.
- When a utility raised rates using tiered rate conservation pricing, a 50/50 savings split was used when increases differed between base and volumetric rates.
    - The reasoning is that all customers must react to the base increase, yet the pricing signal is stronger when volumetric rate increases affect the higher usage customers.
    - The 50/50 split is reasonable because many customers will not reach the higher volumetric tiers.
    - Studies show that most customers do not actually know they have reached the higher volumetric tiers; just that their bill has increased (Texas Water Development Board, 2013).

4.1 Itemized Activities

1. **Utility Website**
   a. Easy-to-use website with conservation tips and water rates
   b. Features contact information for Public Works staff and customer service

2. **Continuing Public Education**
   a. The utility engages the public in many ways including:
      i. Brochures, bill messages, displays, and exhibits
      ii. Educators teaching water conservation classes in public and private schools (K-12)
      iii. Staff making presentation on water conservation to business groups and at universities
      iv. Aggressive social media presence on Facebook, Twitter, Instagram, and Next Door educating the public about water topics.

3. **Water Loss Reduction Savings**[15]
   a. Savings of 364 MG annually in 2015
   b. Water loss reduction savings = the difference between a utility's baseline[16] water loss GPCD submitted in its most recent 5-year water conservation plan and its most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB
   c. If water loss GPCD has increased from the utility's baseline or historic 5-year average to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount.
   d. All savings estimates grow each year at the same rate population figures for the utility grow in the regional water plan.

4. **Water Rate Increase**
   a. Last rate increase:[17]
      i. 3.0% increase in 2015
   b. Estimated customer demand reduction of .6%
   c. Savings is cumulative and based on more than one source[18] (U.S. EPA, 1998; Whitcomb, 1999)
   d. Savings from rate increases are shown to persist over time, however, note that savings from these pricing signals will likely decrease if rates remain the same in future years.
   e. Estimated savings of 8.42% of total utility demand (Hermitte and Mace, 2012; Sierra Club-Lone Star Chapter and the National Wildlife Federation, 2015)
   f. All savings estimates grow each year at the same rate demand figures for the

[15] If current water loss levels exceed a utility's baseline, this value is treated as a deduction from total quantified savings.
[16] In the absence of having a baseline figure provided in the utility's most recently submitted 5-year water conservation plan, the historic 5-year average for water loss GPCD in the plan was used.
[17] Correspondence with utility staff.
[18] The study estimates a 2% demand reduction with 10% increase in price on a targeted customer class. By applying a ratio, it is possible to determine the savings for lower or higher percentage increases.

utility grow in the regional water plan.

5. **Outdoor landscape evaluations (residential surveys) for single family (SF) customers**
    a. 154 outdoor evaluations performed since 2016
    b. Estimated 8,000 gallons per year for each system evaluation (A&N Technical Services, 2005)
        i. Assumed 65% savings from typical indoor and outdoor survey when only outdoor watering is evaluated (Whitcomb, 2000)
    c. Approximately 22 gallons per day
    d. Greater savings during peak periods
    e. Lesser savings during off-peak periods
    f. 20% decay rate per year attributed to customer behavior (A&N Technical Services, 2005)

5 Summary of Savings

Table 5-1. Savings by Water Conservation Activity (MG).

Year	2x Watering Ordinance	Water Rate Increases	Residential Surveys	TOTAL SAVINGS
2009				0
2010				0
2011				0

2022	260,925	11.00	381
2023	263,759	11.00	385
2024	266,593	11.00	389

6 Suggested Activities

Up to four activities were chosen as potential suggested activities for individual reports. These activities are: AMI system with customer portal, twice-per-week (or less) outdoor watering ordinances, strategic water rate increases, and rain barrels.

Activities were chosen because they are:

- Achievable
- Prevalence of vendors that can actually implement them
- Acceptability to city councils, MUD boards, et al.
- Easily adopted
- Cost effective
- Yield high savings relative to cost

AMI systems with customer engagement portals were also chosen because they represent a profusion of future applications that will undoubtedly continue to advance conservation efforts. AMI and meter data management (MDM) companies are developing new and innovative ways to benefit water providers, customers, and ultimately states that are pushing conservation and usage analytics further.

Each utility should be cognizant of the potential impact that these suggested activities may have on its own unique rate and revenue situation.

Benefits to consider:

- Avoided water supply and wastewater costs
  - The higher water purchase, transmission, and distribution costs are, the greater the potential benefit realized when large amounts of water are conserved with these activities.
- Avoided system expansion costs

- Conserving water may allow a utility to postpone building new system capacity by decreasing demand even as population grows.

Costs to consider:

- Staff time and resources
- Unit cost per unit saved
- Implementation costs
- Stakeholder agreement and support
- Other overhead and budget considerations

6.1 Suggested Activities with Savings Estimates

1. Advanced Metering Infrastructure with Customer Engagement Portal

These portals, along with mobile applications and billing statements, can provide customers with much more access to their water use data in simple and compelling formats. This access and comparison with other customers' usage can reduce water use through changed behavior, as well as provide an opportunity for other conservation programs to be offered to the customer for increased adoption and additional savings. AMI systems support leak notification and web portals with real-time data. Any water loss reduction savings that these systems also yield were included in the water loss assessment of individual reports for this project.

a. Specific utility results will vary based on portal features and frequency of customer notifications.
b. Potential savings estimate assumes 20% of residential customers will use and save water due to the portal (Westin Engineering, 2015)
c. Estimate assumes customers will save 10% of total annual use due to the portal
  i. Savings estimate of 10% is an average of results from multiple studies (Chesnutt and Mitchell, 2013; East Bay Municipal Utility District, 2014; IBM, 2011; Texas A&M and Texas Water Resources Institute, 2016; Westin Engineering, 2015)
d. Residential customers' use assumed to make up approximately 67% of all retail customers' use based on utility profile information submitted to the TWDB
  i. This was the most common percentage of residential use among participating utilities in this project.
  ii. Actual customer class demand percentages will vary by utility.
e. 20% of residential customers saving 10% with this customer class breakdown amounts to 1.34% of total demand
f. Savings are assumed to increase along with demand as connections increase each year.[19]

[19] The 10% consumption reduction figure for 20% of residential customers is conservative, but savings could be greater when monitored yearly as customer engagement increases.

g. See Table 6-1 for potential savings from this measure compared with the utility's WMS supply volumes targets.

Table 6-1. Current Savings + Potential Savings from AMI with Customer Portal (MG).

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Potential Savings from AMI with Customer Portal	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)
2016	87	365	452	193	414	0	414	231

Statewide Water Conservation Quantification Project
City of Seminole Report • 2017

1 Introduction

In Texas' 2017 State Water Plan, municipal water conservation is projected to meet 9.6 percent[1] of the state's future water needs by 2070. According to the 16 regional water plans that comprise the state water plan, this is expected to be achieved through a variety of measures such as installation of water efficient plumbing fixtures, water conservation pricing structures, water system audits, landscape irrigation ordinances, as well as other water conservation activities. The 9.6 percent is "in addition to the estimated share of future passive conservation savings from plumbing codes and water efficiency standards, which are embedded in municipal water demand projections" (Texas Water Development Board, 2017).

In 2015, the Texas Legislature appropriated funds to the Texas Water Development Board (TWDB) to fund a research project principally charged with quantitatively determining the savings of municipal water conservation activities being implemented in relation to the recommended conservation goals (supply volumes) in the State Water Plan. As part of the project, individual reports were completed for all participating utilities.

With this report, utilities will benefit by receiving a clear and concise picture of its water conservation goals alongside estimated savings from quantifiable activities. In the event that current activity savings may not be able to reach long-term goals, this report offers suggestions on how utilities can reach water conservation goals with activities that are effective, easily adopted, have widespread appeal, and are quantifiable.

2 Municipal Conservation Terminology and Review of Methodology Used by Regional Planners

To make use of the results of this study, it is important to understand several key terms used in the water planning process.

What is a water user group?

In this report, a water user group (WUG) refers to a retail water provider in the form a city, municipal utility district, water control and improvement district, special utility district, water supply corporation, fresh water supply district, or other type of water utility. The TWDB further defines WUGs as one of the following (Texas Water Development Board, 2016b):

- Cities and towns with a population of 500 or more
- Non-city utilities providing more than 280 acre-feet per year per year of water for municipal use
- Collective reporting units (CRUs) consisting of grouped utilities having a common association

[1] Equal to 811,224 acre-feet per year in conservation savings.

- County-Wide WUGs:
    - County-Other (Rural/unincorporated areas of municipal water use)
    - Manufacturing
    - Steam electric power generation

What is a recommended water management strategy?

A recommended water management strategy (WMS) is a measure that will help ensure WUGs have adequate water supplies for their end users well into the future. WMS examples include river diversions, groundwater use, reservoir and aquifer development, and irrigation conservation. When WMS is referred to in this report, it refers only to municipal conservation, which may include water loss reduction as a part of the same strategy.

What is a WMS supply volume?

A WMS supply volume is the amount of water that a given strategy is expected to yield each decade in the planning period if carried out by the WUG. In this report, a WMS supply volume is the amount of water recommended to come from municipal water conservation.

Some regional water plans separate this strategy's supply volume into a volume for municipal water conservation and a volume for water loss reduction for each decade. The total strategy supply volume is the sum of both. A regional water plan may also refer to "advanced conservation" as part of this strategy. Advanced conservation usually indicates that the volume could be achieved through a more robust mix of conservation activities described in the plan.

2.1 Regional Planning Group Approach to Determining Supply Volumes

Each regional water planning group (RWPG) is responsible for producing its own individual plan that, if executed, will provide sufficient water to its WUGs throughout a 50-year planning period. These plans are completed in five-year cycles, with the most recent edition being completed in 2016. The 2016 regional plans make up the 2017 State Water Plan, which sets out WMS supply volumes for the years 2020 through 2070.

The decadal WMS supply volumes for municipal conservation were established by each of the RWPGs in much the same manner. The RWPGs generally followed the guidelines of the Texas Legislature's Water Conservation Implementation Task Force on the pace utilities should target to reduce gallons per capita per day (GPCD)[2] consumption levels.

The targeted reductions used by most regions follow this formula:

- For municipal WUGs with water use of 140 GPCD and greater, the goal is to reduce per capita water use by one percent per year until the level of 140 GPCD is reached,

[2] Regional water planning GPCD is defined as the annual volume of water pumped, diverted, or purchased minus the volume exported (sold) to other water systems or large industrial facilities divided by the permanent resident population of the Municipal Water User Group in the regional water planning process divided by 365. Saline and reused/recycled water are not included in this volume (Texas Water Development Board, 2012).

after which, the goal is to reduce per capita water use by one-fourth percent per year for the remainder of the planning period (Texas Water Development Board, 2016j).

The yearly reductions in GPCD for a given WUG are then converted into recommended supply volumes in acre-feet per year for each decade as the reductions in consumption continue. Some regions reduce GPCD by slightly different percentages before and after the 140 GPCD threshold, some do not apply further reductions in GPCD for WUGs once they reach 140 GPCD, while others recommend only "advanced conservation" activities once WUGs meet 140 GPCD.

2.2 Methodology

In order to complete a uniform quantification process, the first engagement was with utilities that agreed to participate and collected as much relevant data as possible. These data included, among many others, historical GPCD consumption figures, advanced metering infrastructure (AMI) specifications, and detailed feedback on each conservation activity being implemented. Personal interviews focused on determining when and to what extent these activities were being employed, as well as assessing plans to continue such conservation. Examples of frequently implemented activities include tiered water rate conservation pricing, strategic water rate increases, outdoor irrigation audits and ordinances, and rain barrel distribution.

Subsequently, each utility's conservation activities were quantified through several different means, including evidence-based studies, utility field results and savings determinations, manufacturer guarantees, water loss audits, TWDB studies, and other information that assigned a savings value to the activity's implementation.

Every conservation activity studied and quantified has a gallons-per-year estimate, useful life, and decay rate (if applicable) associated with it. Some activities' savings are projected to grow as demand grows over time, while some savings are constant each year and subside once useful life has run its course. For expanded methodology and details on studies and formulas used to determine activity savings, refer to Section 6 of the State Report included as part of this document.

Once analyzed, the resulting savings estimates from each utility were compared with the recommended WMS supply volumes in its respective regional plan to determine if the savings met, exceeded, or fell short of those volumes. Individual utility savings were aggregated to compare with regional volumes, and regional savings were aggregated to compare with state volumes.

It is important to note that this report quantified activity savings—not including water loss reduction—for the WMS supply volume comparison dating back to 2012. The reason for this is, with a few exceptions, the regional planners used 2011 as the base year for establishing potential WMS supply volumes.[3] In addition, any conservation savings achieved through 2011 are assumed to be accounted for in the regional water planning GPCD for that year.[4] Thus, quantifying from 2012 and forward is the most accurate way to determine if utilities are meeting

[3] Confirmed via personal communication with Region C, H, K, and L Plan consultants.
[4] It was established with TWDB planning staff that 2011 GPCD levels were chosen because they represented the most current water use and conservation patterns at the time.

the recommended conservation volumes in the regional plans. This assumption is by no means 100 percent accurate, however. Some previously implemented activities' savings persist into future years beyond this starting point, while some activities' savings have ceased. One year's GPCD will not necessarily include all savings yielded by conservation activities that came before it, but the quantification assessment must have a starting point.

2.3 Quantifiable Savings

The key to the project being useful and reliable is that the results from year to year are measurable. Quantifying conservation activities that can be accurately measured provides greater certainty and better planning for all stakeholders.

While many utilities are engaged in a variety of conservation activities, not all can currently be properly measured. Some examples of these activities include education initiatives, website and social media engagement, and enforcement for water waste. That does not mean these measures are not essential. Education of consumers, for example, is a fundamental activity that makes all others effective, but little hard data exists to quantify the results of education alone.

In addition, the work of conservation coordinators can have a particularly significant effect on the savings of all other activities, but the specific savings attributed to that staff role is difficult to quantify.

3 Results

This report compares Seminole's current water conservation activities and their quantified savings to two metrics: 1) Region O Water Plan's (Texas Water Development Board, 2016m) recommended WMS supply volumes for municipal conservation, and 2) Seminole's own five- and 10-year goals as established in its most recent water conservation plan submitted to the TWDB.

The WMS supply volumes for municipal water conservation are laid out by decade (2020 – 2070) in the regional water plans to serve as benchmarks for what each utility could achieve via that strategy during a 50-year planning period.[5]

The five- and 10-year goals in Seminole's most recent water conservation plan are established by the utility as realistic targets for reducing consumption over that timeframe. These reductions[6] are expressed in decreasing total GPCD[7] consumption and water loss GPCD.[8] [9]
The estimated savings in Tables 3-1 through 3-3 indicate the best information available as provided by utility staff. Some ongoing activities may not be known and are within a utility's service area are implemented on a micro-scale that may not be quantified. Individual households

[5] Some regional water plans separate this strategy volume into a volume for water conservation and a volume for water loss reduction for each decade. The total strategy volume is the sum of both.
[6] Occasionally, some utilities expect consumption to increase due to various reasons, such as an incoming industrial presence expected to raise consumption figures for the entire service area.
[7] As defined in TWDB water conservation annual reports: (Total Gallons in System ÷ Permanent Population) ÷ 365
[8] These plans also have targets for residential GPCD and water loss as a percentage (rather than GPCD), but this report does not address those goals.
[9] As defined in annual TWDB water loss audits: (Total Water Loss ÷ Permanent Population) ÷ 365

and businesses may be implementing conservation measures that are unknown and therefore cannot be included in the report.

Explanation of approach to assessing water loss reduction savings

Water loss reduction savings are defined as the volume of water participating utilities are realizing from their water loss mitigation efforts. For this report, this value is the difference between each individual utility's baseline[10] for water loss GPCD and its most recent water loss GPCD reported in 2015 water loss audits on file with TWDB. Savings from all water loss reduction efforts—including pipe replacements and leak repair—are assumed to be included in this comparison to a utility's baseline.

Note that because a single year (2015) value was used for comparison, it is possible that the 2015 value could be anomalous due to a number of events that may have occurred that year, such as a water main break, a particularly wet year, or a robust effort by the utility to curtail water loss. This will distort future savings figures that were carried forward in the study because water loss will inevitably increase or decrease in later years.

Ideally, using a rolling five-year average in the calculation would correct such anomalies. However, there was insufficient data to do that for every utility. The approach was to use the most complete water loss data possible, which was represented by the 2015 water loss audit. This problem will be further minimized, as continued data collection will allow five-year averages to be calculated for a majority of utilities.

In this way, water loss savings estimates are different from all other activity savings estimates in the project. Whether savings were positive or negative depended on where individual utilities established their own baselines or where their five-year average started, and what water loss GPCD value was reported in 2015.

3.1 Current Savings Compared to Conservation WMS Supply Volume (in million gallons) in Regional Water Plan

Table 3-1 shows the 2070 outlook for Seminole with the utility's yearly recommended WMS supply volume in million gallons (MG) alongside its water savings from implemented activities, including from water loss reduction. These activities and their associated savings are covered in greater detail in Sections 4 and 5.

Starting in 2015, this table compares all quantified conservation activity and the recommended conservation WMS supply volume for the planning period. The following definitions pair with the column headers in Table 3-1.

<u>Actual Current Conservation Activity Savings</u> – All quantified activities currently being performed by the utility, *excluding* savings from water loss reduction. The regional planners used 2011 GPCD as the baseline for determining future conservation WMS supply volumes, therefore the study quantifies utility savings starting in 2012 for this comparison. The summary of these

[10] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.

savings can be referenced in Table 5-1.

Actual Water Loss Reduction Savings (as of 2015) – The difference between the baseline[11] for water loss GPCD and most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB. [12] The summary of these savings can be referenced in Table 5-2.

Total Savings from All Conservation Activity – Actual Current Conservation Activity Savings plus Actual Water Loss Reduction Savings (as of 2015).

Conservation WMS Volume – The recommended municipal water conservation supply volume in the regional plan for the decades ranging from 2020 to 2070. These volumes are converted to MG from the values listed in the plan in acre-feet and then calculated in annual increments.

Water Loss Reduction WMS Volume – Some regional water plans have a separate WMS volume for water conservation and for water loss reduction for each decade. If a WUG's regional plan has a WMS volume for water loss reduction, this column will have values other than zero.

Total Yearly WMS Volume – The sum of the Conservation WMS Volume and Water Loss Reduction WMS Volume.

Over (Short) – The amount that the utility's Total Savings from All Conservation Activity (since 2012), is over or below the Total Yearly WMS Volume in the regional water plan. If the amount falls below the WMS volume, it will appear in parentheses.

[11] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.
[12] If water loss GPCD has increased from the utility's baseline or historic five-year average to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount.

Table 3-1. Current Savings Compared to Conservation WMS Supply Volume (MG) in Regional Water Plan.

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)
2015	22.6	(33)	(10)	17	0	17	(27)
2016	27.2	(32)	(5)	21	0	21	(26)

2067	43.4	(49)	(6)	59	0	59	(65)
2068	43.7	(50)	(6)	59	0	59	(65)
2069	44.0	(50)	(6)	60	0	60	(65)
2070	44.3	(50)	(6)	60	0	60	(66)

3.2 Utility Water Conservation Plan Goals – Total GPCD

Table 3-2 shows how Seminole's quantified savings from its implemented activities compare with 5- and 10-year goals established in its individual water conservation plan submitted to the TWDB. The following definitions pair with the column headers in Table 3-2.

Utility Population – Estimated utility service area population for the years indicated.

Total GPCD Goals – Total GPCD goals start with the utility's baseline[13] for total GPCD and progress in subsequent years to match 5- and 10-year goals indicated in a utility's five-year water conservation plan on file with the TWDB. The first five annual GPCD goals were developed by spreading the difference between the baseline and five-year goal evenly over five years. The second five annual GPCD goals spread the difference between the five-year goal and 10-year goal evenly over the next five years.

Annual Savings Goal with Reduction in GPCD (MG) – This column shows what reductions from the baseline GPCD would yield in terms of volume each year as more water is saved. The volumes indicated here are what target GPCD goals look like expressed in million gallons. Annual volumes were derived using the formula: (baseline total GPCD – target total GPCD for that year) x 365 days ÷ 1,000,000 gallons.

Total Savings for All Current Quantified Activities (MG) – Total quantified savings for all current conservation activities and savings from water loss reduction. Refer to Tables 5-1 and 5-2 for details on these savings.

Over (Short) – The amount that the utility's total quantified savings for all current conservation activities (since 2012), including water loss reduction, is over or below the volume represented by reductions in GPCD each year. If the quantified savings are less than these target volumes, the value will appear in parentheses.

Table 3-2. Utility Water Conservation Plan Goals — Total GPCD.

Year #	Year	Utility Population	Total GPCD Goals	Annual Savings Goal with Reduction in GPCD (MG)	Total Savings for All Current Quantified Activities (MG)	Over (Short) (MG)
0	**Baseline**	7,257	268	0	0	0
1	2015	7,448	265	7	(10)	(17)
2	2016	7,379	263	14	(5)	(19)
3	2017	7,310	260	21	(5)	(25)
4	2018	7,240	258	27	(4)	(31)
5-year Goal	2019	7,171	255	34	(3)	(37)
6	2020	7,102	252	41	(3)	(44)
7	2021	7,181	249	49	(3)	(52)
8	2022	7,260	247	57	(3)	(60)
9	2023	7,339	244	65	(3)	(68)
10-year Goal	2024	7,418	241	73	(3)	(76)

[13] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for total GPCD from the utility's most recently submitted five-year water conservation plan was used.

3.3 Utility Water Conservation Plan Goals – Water Loss GPCD

Table 3-3 shows how Seminole's most recent water loss audit compares with five- and 10-year water loss goals in its water conservation plan. The following definitions pair with the column headers in Table 3-2.

Utility Population – Estimated utility service area population for the years indicated.

Water Loss GPCD Goals – Water loss GPCD goals start with the utility's baseline[14] for water loss GPCD and progress in subsequent years to match 5- and 10-year water loss goals indicated in a utility's five-year water conservation plan on file with the TWDB. The first five annual GPCD goals were developed by spreading the difference between the baseline and five-year goal evenly over five years. The second five annual GPCD goals spread the difference between the five-year goal and 10-year goal evenly over the next five years.

Yearly Savings Goal with Reduction in GPCD (MG) – This column shows what reductions from the baseline water loss GPCD would yield in terms of volume each year as more water is saved. The volumes indicated here are what target water loss GPCD goals look like expressed in million gallons. Annual volumes were derived using the formula: (baseline water loss GPCD – target water loss GPCD for that year) x 365 days ÷ 1,000,000 gallons.

Total Savings from Water Loss Reduction (MG) – The difference between a utility's established baseline for water loss GPCD and the most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB. If water loss GPCD has increased from the utility's baseline to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount. Reference Table 5-2 for savings from water loss reduction.

Over (Short) – The amount that the utility's total savings from water loss reduction is over or below the volume represented by reductions in GPCD each year. If water loss reduction savings are less than these target volumes, the value will appear in parentheses.

Table 3-3. Utility Water Conservation Plan Goals — Water Loss GPCD.

Year #	Year	Utility Population	Water Loss GPCD Goals	Yearly Savings Goal with Reduction in GPCD (MG)	Total Savings from Water Loss Reduction (MG)	Over (Short) (MG)
0	**Baseline**	7,257	13.00	0	0	0
1	2015	7,448	25.00	(33)	(33)	0
2	2016	7,379	24.80	(32)	(32)	(1)
3	2017	7,310	24.60	(31)	(32)	(1)
4	2018	7,240	24.40	(30)	(32)	(2)
5-year Goal	2019	7,171	12.00	3	(31)	(34)
6	2020	7,102	11.80	3	(31)	(34)
7	2021	7,181	11.60	4	(31)	(35)
8	2022	7,260	11.40	4	(32)	(36)
9	2023	7,339	11.20	5	(32)	(37)
10-year Goal	2024	7,418	11.00	5	(32)	(38)

[14] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.

4 Implemented Activities

Below is a list of completed activities with estimated water savings. Note that drought response and other measures are not included in the utility's water savings because they are temporary, awareness-based or not able to be accurately quantified on an annual basis.

These are not savings projections of potential future activities. Estimated savings are based on measures that have actually been implemented. If savings are shown to persist in future years, it is because the measure is permanent, such as an ordinance, or the savings are assumed to continue for the reason listed under the itemized activity. Estimated savings from water rate increases are the one exception to these conditions.

Water Rate Increases

Savings from water rate increases were included because entities such as the U.S. Environmental Protection Agency and others indicate specific savings for utilities that raise rates (Texas Water Development Board, 2013; U.S. E.P.A., 1998; Whitcomb, 1999). This project includes surveys of several utilities that have minimal education efforts, perform no other substantive conservation activities, and yet experienced significant demand reduction that coincided with rate increases. In those cases, savings estimates matched up closely with decreases in total GPCD. For many smaller utilities, especially those with customers lacking disposable income, this measure is the only tool used to conserve other than water loss reduction.

The following assumptions were made for water rate increases:

- The model assumes that savings persist into future years because it is expected that the utility will continue to make periodic rate increases in line with the percentage increases from previous years.
- Only the last two rate increases for a utility were quantified.
- Savings grow with demand because as new customers enter the service area, they are assumed to adhere to the same price elasticity model estimates.
- A weighted average for savings was used when rate increases differed between residential and industrial-commercial-institutional (ICI) customers based on the individual utility's customer class breakdown.
- When a utility raised rates using tiered rate conservation pricing, a 50/50 savings split was used when increases differed between base and volumetric rates.
    - The reasoning is that all customers must react to the base increase, yet the pricing signal is stronger when volumetric rate increases affect the higher usage customers.
    - The 50/50 split is reasonable because many customers will not reach the higher volumetric tiers.
    - Studies show that most customers do not actually know they have reached the higher volumetric tiers; just that their bill has increased (Texas Water Development Board, 2013).

4.1 Itemized Activities

1. **Utility Website**
   a. Easy-to-use website with conservation tips and water rates
   b. Features contact information for Public Works staff and customer service

2. **Continuing Public Education**
   a. The utility engages the public in many ways including:
      i. Brochures, bill messages, displays, and exhibits

3. **Water Loss Reduction Savings**[15]
   a. Loss of 33 MG annually in 2015
   b. Water loss reduction savings = the difference between a utility's baseline[16] water loss GPCD submitted in its most recent 5-year water conservation plan and its most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB
   c. If water loss GPCD has increased from the utility's baseline or historic 5-year average to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount.
   d. All savings estimates grow each year at the same rate population figures for the utility grow in the regional water plan.

4. **Conservation Pricing and Water Rate Increases**
   a. Tiered rate structure in place saves approximately 2.5% of total demand
   b. Savings is cumulative and based on more than one source[17] (U.S. EPA, 1998; TWDB, 2013)

5. **Automatic Meter Reading (AMR)/Advanced Metering Infrastructure (AMI)**
   a. These metering systems can save water in a number of ways, including from water loss reduction through improved leak detection.
   b. All water loss reduction savings associated with this activity are detailed in Section 5, which assessed utility baseline water loss GPCD and most recently reported water loss GPCD to determine water savings.
   c. For estimated water savings that could be increased by implementing meter data management (MDM) and customer engagement portal applications, refer to Section 6 of this report.
      i. With these additional applications, water savings can be achieved through changed customer behavior and other real-time actions that go beyond water loss reduction.

---

[15] If current water loss levels exceed a utility's baseline, this value is treated as a deduction from total quantified savings.
[16] In the absence of having a baseline figure provided in the utility's most recently submitted 5-year water conservation plan, the historic 5-year average for water loss GPCD in the plan was used.
[17] The study estimates a 2% demand reduction with 10% increase in price on a targeted customer class. By applying a ratio, it is possible to determine the savings for lower or higher percentage increases.

5 Summary of Savings

Table 5-1. Savings by Water Conservation Activity (MG).

Year	Conservation Pricing	Water Rate Increase	TOTAL SAVINGS
2012			0
2013			0
2014	18.0	4.3	22.4
2015	18.2	4.4	22.6
2016	18.4	8.8	27.2
2017	18.6	8.9	27.5
2018	18.8	9.0	27.8
2019	18.9	9.1	28.0
2020	19.1	9.2	28.3
2021	19.3	9.3	28.6
2022	19.5	9.4	28.9
2023	19.7	9.4	29.1
2024	19.9	9.5	29.4
2025	20.0	9.6	29.7
2026	20.2	9.7	29.9
2027	20.4	9.8	30.2
2028	20.6	9.9	30.5
2029	20.8	10.0	30.7
2030	20.9	10.1	31.0
2031	21.2	10.2	31.3
2032	21.4	10.3	31.7
2033	21.6	10.4	32.0
2034	21.8	10.5	32.3
2035	22.1	10.6	32.7
2036	22.3	10.7	33.0
2037	22.5	10.8	33.3
2038	22.7	10.9	33.7
2039	23.0	11.0	34.0
2040	23.2	11.1	34.3
2041	23.5	11.3	34.7
2042	23.7	11.4	35.1
2043	24.0	11.5	35.5
2044	24.2	11.6	35.8
2045	24.5	11.7	36.2
2046	24.7	11.9	36.6
2047	25.0	12.0	37.0
2048	25.2	12.1	37.3
2049	25.5	12.2	37.7
2050	25.7	12.4	38.1
2051	26.0	12.5	38.4
2052	26.2	12.6	38.7
2053	26.4	12.7	39.0
2054	26.6	12.8	39.3
2055	26.8	12.8	39.6
2056	27.0	12.9	39.9
2057	27.2	13.0	40.2
2058	27.4	13.1	40.5
2059	27.6	13.2	40.8
2060	27.8	13.3	41.1
2061	28.0	13.4	41.4
2062	28.2	13.5	41.8
2063	28.4	13.6	42.1
2064	28.7	13.8	42.4
2065	28.9	13.9	42.7
2066	29.1	14.0	43.0
2067	29.3	14.1	43.4
2068	29.5	14.2	43.7
2069	29.7	14.3	44.0
2070	29.9	14.4	44.3

Table 5-2. Savings from Water Loss Reduction (MG).

Year	Utility Population	Water Loss GPCD	Total Savings from Water Loss Reduction
Baseline		13.00	0
2015	7,448	25.00	(33)
2016	7,379	25.00	(32)
2017	7,310	25.00	(32)

2024	7,418	25.00	(32)

6 Suggested Activities

Up to four activities were chosen as potential suggested activities for individual reports. These activities are: AMI system with customer portal, twice-per-week (or less) outdoor watering ordinances, strategic water rate increases, and rain barrels.

Activities were chosen because they are:

- Achievable
- Prevalence of vendors that can actually implement them
- Acceptability to city councils, MUD boards, et al.
- Easily adopted
- Cost effective
- Yield high savings relative to cost

AMI systems with customer engagement portals were also chosen because they represent a profusion of future applications that will undoubtedly continue to advance conservation efforts. AMI and meter data management (MDM) companies are developing new and innovative ways to benefit water providers, customers, and ultimately states that are pushing conservation and usage analytics further.

Each utility should be cognizant of the potential impact that these suggested activities may have on its own unique rate and revenue situation.

Benefits to consider:

- Avoided water supply and wastewater costs
    - The higher water purchase, transmission, and distribution costs are, the greater the potential benefit realized when large amounts of water are conserved with these activities.
- Avoided system expansion costs

- Conserving water may allow a utility to postpone building new system capacity by decreasing demand even as population grows.

Costs to consider:

- Staff time and resources
- Unit cost per unit saved
- Implementation costs
- Stakeholder agreement and support
- Other overhead and budget considerations

6.1 Suggested Activities with Savings Estimates

1. Advanced Metering Infrastructure with Customer Engagement Portal

These portals, along with mobile applications and billing statements, can provide customers with much more access to their water use data in simple and compelling formats. This access and comparison with other customers' usage can reduce water use through changed behavior, as well as provide an opportunity for other conservation programs to be offered to the customer for increased adoption and additional savings. AMI systems support leak notification and web portals with real-time data. Any water loss reduction savings that these systems also yield were included in the water loss assessment of individual reports for this project.

a. Specific utility results will vary based on portal features and frequency of customer notifications.
b. Potential savings estimate assumes 20% of residential customers will use and save water due to the portal (Westin Engineering, 2015)
c. Estimate assumes customers will save 10% of total annual use due to the portal
  i. Savings estimate of 10% is an average of results from multiple studies (Chesnutt and Mitchell, 2013; East Bay Municipal Utility District, 2014; IBM, 2011; Texas A&M and Texas Water Resources Institute, 2016; Westin Engineering, 2015)
d. Residential customers' use assumed to make up approximately 67% of all retail customers' use based on utility profile information submitted to the TWDB
  i. This was the most common percentage of residential use among participating utilities in this project.
  ii. Actual customer class demand percentages will vary by utility.
e. 20% of residential customers saving 10% with this customer class breakdown amounts to 1.34% of total demand
f. Savings are assumed to increase along with demand as connections increase each year.[18]

[18] The 10% consumption reduction figure for 20% of residential customers is conservative, but savings could be greater when monitored yearly as customer engagement increases.

g. See Table 6-1 for potential savings from this measure compared with the utility's WMS supply volumes targets.

Table 6-1. Current Savings + Potential Savings from AMI with Customer Portal (MG).

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Potential Savings from AMI with Customer Portal	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)
2016	27	(32)	(5)	10	21	0	21	(16)
2017	28	(32)	(5)	10	21	0	21	(16)
2018	28	(32)	(4)	10	25	0	25	(19)
2019	28	(31)	(3)	10	30	0	30	(23)
2020	28	(31)	(3)	10	38	0	38	(31)
2021	29	(31)	(3)	10	39	0	39	(31)
2022	29	(32)	(3)	10	39	0	39	(31)
2023	29	(32)	(3)	11	39	0	39	(32)
2024	29	(32)	(3)	11	40	0	40	(32)
2025	30	(33)	(3)	11	40	0	40	(33)
2026	30	(33)	(3)	11	40	0	40	(33)
2027	30	(34)	(3)	11	41	0	41	(33)
2028	30	(34)	(3)	11	41	0	41	(34)
2029	31	(34)	(3)	11	42	0	42	(34)
2030	31	(35)	(4)	11	42	0	42	(34)
2031	31	(35)	(4)	11	42	0	42	(35)
2032	32	(35)	(4)	11	43	0	43	(35)
2033	32	(36)	(4)	12	43	0	43	(36)
2034	32	(36)	(4)	12	44	0	44	(36)
2035	33	(37)	(4)	12	44	0	44	(36)
2036	33	(37)	(4)	12	45	0	45	(37)
2037	33	(37)	(4)	12	45	0	45	(37)
2038	34	(38)	(4)	12	45	0	45	(37)
2039	34	(38)	(4)	12	46	0	46	(38)
2040	34	(39)	(4)	12	46	0	46	(38)

2. Water Rate Increase
    a. For every 10% increase, estimated savings could be 2% of utility total demand.
    b. Approximately 15 MG of savings per year with current demand
    c. Savings is cumulative and based on more than one source[19] (U.S. EPA, 1998; Whitcomb, 1999)
    d. See Table 6-2 for potential savings from this measure compared with the utility's conservation goals.

[19] The study estimates a 2% demand reduction with 10% increase in price on a targeted customer class. By applying a ratio, it is possible to determine the savings for lower or higher percentage increases.

Table 6-2. Current Savings + Potential Savings from 10% Water Rate Increase (MG).

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Potential Savings from Water Rate Increase	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)

Statewide Water Conservation Quantification Project
City of Silverton Report • 2017

1 Introduction

In Texas' 2017 State Water Plan, municipal water conservation is projected to meet 9.6 percent[1] of the state's future water needs by 2070. According to the 16 regional water plans that comprise the state water plan, this is expected to be achieved through a variety of measures such as installation of water efficient plumbing fixtures, water conservation pricing structures, water system audits, landscape irrigation ordinances, as well as other water conservation activities. The 9.6 percent is "in addition to the estimated share of future passive conservation savings from plumbing codes and water efficiency standards, which are embedded in municipal water demand projections" (Texas Water Development Board, 2017).

In 2015, the Texas Legislature appropriated funds to the Texas Water Development Board (TWDB) to fund a research project principally charged with quantitatively determining the savings of municipal water conservation activities being implemented in relation to the recommended conservation goals (supply volumes) in the State Water Plan. As part of the project, individual reports were completed for all participating utilities.

With this report, utilities will benefit by receiving a clear and concise picture of its water conservation goals alongside estimated savings from quantifiable activities. In the event that current activity savings may not be able to reach long-term goals, this report offers suggestions on how utilities can reach water conservation goals with activities that are effective, easily adopted, have widespread appeal, and are quantifiable.

2 Municipal Conservation Terminology and Review of Methodology Used by Regional Planners

To make use of the results of this study, it is important to understand several key terms used in the water planning process.

What is a water user group?

In this report, a water user group (WUG) refers to a retail water provider in the form a city, municipal utility district, water control and improvement district, special utility district, water supply corporation, fresh water supply district, or other type of water utility. The TWDB further defines WUGs as one of the following (Texas Water Development Board, 2016b):

- Cities and towns with a population of 500 or more
- Non-city utilities providing more than 280 acre-feet per year per year of water for municipal use
- Collective reporting units (CRUs) consisting of grouped utilities having a common association

[1] Equal to 811,224 acre-feet per year in conservation savings.

- County-Wide WUGs:
    - County-Other (Rural/unincorporated areas of municipal water use)
    - Manufacturing
    - Steam electric power generation

What is a recommended water management strategy?

A recommended water management strategy (WMS) is a measure that will help ensure WUGs have adequate water supplies for their end users well into the future. WMS examples include river diversions, groundwater use, reservoir and aquifer development, and irrigation conservation. When WMS is referred to in this report, it refers only to municipal conservation, which may include water loss reduction as a part of the same strategy.

What is a WMS supply volume?

A WMS supply volume is the amount of water that a given strategy is expected to yield each decade in the planning period if carried out by the WUG. In this report, a WMS supply volume is the amount of water recommended to come from municipal water conservation.

Some regional water plans separate this strategy's supply volume into a volume for municipal water conservation and a volume for water loss reduction for each decade. The total strategy supply volume is the sum of both. A regional water plan may also refer to "advanced conservation" as part of this strategy. Advanced conservation usually indicates that the volume could be achieved through a more robust mix of conservation activities described in the plan.

2.1 Regional Planning Group Approach to Determining Supply Volumes

Each regional water planning group (RWPG) is responsible for producing its own individual plan that, if executed, will provide sufficient water to its WUGs throughout a 50-year planning period. These plans are completed in five-year cycles, with the most recent edition being completed in 2016. The 2016 regional plans make up the 2017 State Water Plan, which sets out WMS supply volumes for the years 2020 through 2070.

The decadal WMS supply volumes for municipal conservation were established by each of the RWPGs in much the same manner. The RWPGs generally followed the guidelines of the Texas Legislature's Water Conservation Implementation Task Force on the pace utilities should target to reduce gallons per capita per day (GPCD)[2] consumption levels.

The targeted reductions used by most regions follow this formula:

- For municipal WUGs with water use of 140 GPCD and greater, the goal is to reduce per capita water use by one percent per year until the level of 140 GPCD is reached,

[2] Regional water planning GPCD is defined as the annual volume of water pumped, diverted, or purchased minus the volume exported (sold) to other water systems or large industrial facilities divided by the permanent resident population of the Municipal Water User Group in the regional water planning process divided by 365. Saline and reused/recycled water are not included in this volume (Texas Water Development Board, 2012).

after which, the goal is to reduce per capita water use by one-fourth percent per year for the remainder of the planning period (Texas Water Development Board, 2016j).

The yearly reductions in GPCD for a given WUG are then converted into recommended supply volumes in acre-feet per year for each decade as the reductions in consumption continue. Some regions reduce GPCD by slightly different percentages before and after the 140 GPCD threshold, some do not apply further reductions in GPCD for WUGs once they reach 140 GPCD, while others recommend only "advanced conservation" activities once WUGs meet 140 GPCD.

2.2 Methodology

In order to complete a uniform quantification process, the first engagement was with utilities that agreed to participate and collected as much relevant data as possible. These data included, among many others, historical GPCD consumption figures, advanced metering infrastructure (AMI) specifications, and detailed feedback on each conservation activity being implemented. Personal interviews focused on determining when and to what extent these activities were being employed, as well as assessing plans to continue such conservation. Examples of frequently implemented activities include tiered water rate conservation pricing, strategic water rate increases, outdoor irrigation audits and ordinances, and rain barrel distribution.

Subsequently, each utility's conservation activities were quantified through several different means, including evidence-based studies, utility field results and savings determinations, manufacturer guarantees, water loss audits, TWDB studies, and other information that assigned a savings value to the activity's implementation.

Every conservation activity studied and quantified has a gallons-per-year estimate, useful life, and decay rate (if applicable) associated with it. Some activities' savings are projected to grow as demand grows over time, while some savings are constant each year and subside once useful life has run its course. For expanded methodology and details on studies and formulas used to determine activity savings, refer to Section 6 of the State Report included as part of this document.

Once analyzed, the resulting savings estimates from each utility were compared with the recommended WMS supply volumes in its respective regional plan to determine if the savings met, exceeded, or fell short of those volumes. Individual utility savings were aggregated to compare with regional volumes, and regional savings were aggregated to compare with state volumes.

It is important to note that this report quantified activity savings—not including water loss reduction—for the WMS supply volume comparison dating back to 2012. The reason for this is, with a few exceptions, the regional planners used 2011 as the base year for establishing potential WMS supply volumes.[3] In addition, any conservation savings achieved through 2011 are assumed to be accounted for in the regional water planning GPCD for that year.[4] Thus, quantifying from 2012 and forward is the most accurate way to determine if utilities are meeting

[3] Confirmed via personal communication with Region C, H, K, and L Plan consultants.
[4] It was established with TWDB planning staff that 2011 GPCD levels were chosen because they represented the most current water use and conservation patterns at the time.

the recommended conservation volumes in the regional plans. This assumption is by no means 100 percent accurate, however. Some previously implemented activities' savings persist into future years beyond this starting point, while some activities' savings have ceased. One year's GPCD will not necessarily include all savings yielded by conservation activities that came before it, but the quantification assessment must have a starting point.

2.3 Quantifiable Savings

The key to the project being useful and reliable is that the results from year to year are measurable. Quantifying conservation activities that can be accurately measured provides greater certainty and better planning for all stakeholders.

While many utilities are engaged in a variety of conservation activities, not all can currently be properly measured. Some examples of these activities include education initiatives, website and social media engagement, and enforcement for water waste. That does not mean these measures are not essential. Education of consumers, for example, is a fundamental activity that makes all others effective, but little hard data exists to quantify the results of education alone.

In addition, the work of conservation coordinators can have a particularly significant effect on the savings of all other activities, but the specific savings attributed to that staff role is difficult to quantify.

3 Results

This report compares Silverton's current water conservation activities and their quantified savings to two metrics: 1) Region O Water Plan's (Texas Water Development Board, 2016m) recommended WMS supply volumes for municipal conservation, and 2) Silverton's own five- and 10-year goals as established in its most recent water conservation plan submitted to the TWDB.

The WMS supply volumes for municipal water conservation are laid out by decade (2020 – 2070) in the regional water plans to serve as benchmarks for what each utility could achieve via that strategy during a 50-year planning period.[5]

The five- and 10-year goals in Silverton's most recent water conservation plan are established by the utility as realistic targets for reducing consumption over that timeframe. These reductions[6] are expressed in decreasing total GPCD [7] consumption and water loss GPCD.[8] [9]

The estimated savings in Tables 3-1 through 3-3 indicate the best information available as provided by utility staff. Some ongoing activities may not be known and are within a utility's

[5] Some regional water plans separate this strategy volume into a volume for water conservation and a volume for water loss reduction for each decade. The total strategy volume is the sum of both.
[6] Occasionally, some utilities expect consumption to increase due to various reasons, such as an incoming industrial presence expected to raise consumption figures for the entire service area.
[7] As defined in TWDB water conservation annual reports: (Total Gallons in System ÷ Permanent Population) ÷ 365
[8] These plans also have targets for residential GPCD and water loss as a percentage (rather than GPCD), but this report does not address those goals.
[9] As defined in annual TWDB water loss audits: (Total Water Loss ÷ Permanent Population) ÷ 365

service area are implemented on a micro-scale that may not be quantified. Individual households and businesses may be implementing conservation measures that are unknown and therefore cannot be included in the report.

Explanation of approach to assessing water loss reduction savings

Water loss reduction savings are defined as the volume of water participating utilities are realizing from their water loss mitigation efforts. For this report, this value is the difference between each individual utility's baseline[10] for water loss GPCD and its most recent water loss GPCD reported in 2015 water loss audits on file with TWDB. Savings from all water loss reduction efforts—including pipe replacements and leak repair—are assumed to be included in this comparison to a utility's baseline.

Note that because a single year (2015) value was used for comparison, it is possible that the 2015 value could be anomalous due to a number of events that may have occurred that year, such as a water main break, a particularly wet year, or a robust effort by the utility to curtail water loss. This will distort future savings figures that were carried forward in the study because water loss will inevitably increase or decrease in later years.

Ideally, using a rolling five-year average in the calculation would correct such anomalies. However, there was insufficient data to do that for every utility. The approach was to use the most complete water loss data possible, which was represented by the 2015 water loss audit. This problem will be further minimized, as continued data collection will allow five-year averages to be calculated for a majority of utilities.

In this way, water loss savings estimates are different from all other activity savings estimates in the project. Whether savings were positive or negative depended on where individual utilities established their own baselines or where their five-year average started, and what water loss GPCD value was reported in 2015.

3.1 Current Savings Compared to Conservation WMS Supply Volume (in Million Gallons) in Regional Water Plan

Table 3-1 shows the 2070 outlook for Silverton with the utility's yearly recommended WMS supply volume in million gallons (MG) alongside its water savings from implemented activities, including from water loss reduction. These activities and their associated savings are covered in greater detail in Sections 4 and 5.

Starting in 2015, this table compares all quantified conservation activity and the recommended conservation WMS supply volume for the planning period. The following definitions pair with the column headers in Table 3-1.

<u>Actual Current Conservation Activity Savings</u> – All quantified activities currently being performed by the utility, *excluding* savings from water loss reduction. The regional planners used 2011 GPCD as the baseline for determining future conservation WMS supply volumes, therefore

[10] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.

the study quantifies utility savings starting in 2012 for this comparison. The summary of these savings can be referenced in Table 5-1.

Actual Water Loss Reduction Savings (as of 2015) – The difference between the baseline[11] for water loss GPCD and most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB. [12] The summary of these savings can be referenced in Table 5-2.

Total Savings from All Conservation Activity – Actual Current Conservation Activity Savings plus Actual Water Loss Reduction Savings (as of 2015).

Conservation WMS Volume – The recommended municipal water conservation supply volume in the regional plan for the decades ranging from 2020 to 2070. These volumes are converted to MG from the values listed in the plan in acre-feet and then calculated in annual increments.

Water Loss Reduction WMS Volume – Some regional water plans have a separate WMS volume for water conservation and for water loss reduction for each decade. If a WUG's regional plan has a WMS volume for water loss reduction, this column will have values other than zero.

Total Yearly WMS Volume – The sum of the Conservation WMS Volume and Water Loss Reduction WMS Volume.

Over (Short) – The amount that the utility's Total Savings from All Conservation Activity (since 2012), is over or below the Total Yearly WMS Volume in the regional water plan. If the amount falls below the WMS volume, it will appear in parentheses.

[11] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.
[12] If water loss GPCD has increased from the utility's baseline or historic five-year average to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount.

Table 3-1. Current Savings Compared to Conservation WMS Supply Volume (MG) in Regional Water Plan.

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)
2015	1.62	0.28	1.9	0.9	0	0.9	1.0
2016	1.62	0.28	1.9	1.1	0	1.1	0.8
2017	1.61	0.28	1.9	1.1	0	1.1	0.8

2063	1.51	0.27	1.8	0.7	0	0.7	1.1
2064	1.51	0.27	1.8	0.7	0	0.7	1.1
2065	1.51	0.27	1.8	0.7	0	0.7	1.1
2066	1.51	0.27	1.8	0.7	0	0.7	1.1
2067	1.51	0.27	1.8	0.7	0	0.7	1.1
2068	1.51	0.27	1.8	0.7	0	0.7	1.1
2069	1.51	0.27	1.8	0.7	0	0.7	1.1
2070	1.51	0.27	1.8	0.7	0	0.7	1.1

3.2 Utility Water Conservation Plan Goals – Total GPCD

Table 3-2 shows how Silverton's quantified savings from its implemented activities compare with 5- and 10-year goals established in its individual water conservation plan submitted to the TWDB. The following definitions pair with the column headers in Table 3-2.

Utility Population – Estimated utility service area population for the years indicated.

Total GPCD Goals – Total GPCD goals start with the utility's baseline[13] for total GPCD and progress in subsequent years to match 5- and 10-year goals indicated in a utility's five-year water conservation plan on file with the TWDB. The first five annual GPCD goals were developed by spreading the difference between the baseline and five-year goal evenly over five years. The second five annual GPCD goals spread the difference between the five-year goal and 10-year goal evenly over the next five years.

Annual Savings Goal with Reduction in GPCD (MG) – This column shows what reductions from the baseline GPCD would yield in terms of volume each year as more water is saved. The volumes indicated here are what target GPCD goals look like expressed in million gallons. Annual volumes were derived using the formula: (baseline total GPCD – target total GPCD for that year) x 365 days ÷ 1,000,000 gallons.

Total Savings for All Current Quantified Activities (MG) – Total quantified savings for all current conservation activities and savings from water loss reduction. Refer to Tables 5-1 and 5-2 for details on these savings.

Over (Short) – The amount that the utility's total quantified savings for all current conservation activities (since 2012), including water loss reduction, is over or below the volume represented by reductions in GPCD each year. If the quantified savings are less than these target volumes, the value will appear in parentheses.

Table 3-2. Utility Water Conservation Plan Goals — Total GPCD.

Year #	Year	Utility Population	Total GPCD Goals	Annual Savings Goal with Reduction in GPCD (MG)	Total Savings for All Current Quantified Activities (MG)	Over (Short) (MG)
0	**Baseline**	-	121	0	0	0
1	2015	779	123	(1)	2	2
2	2016	771	125	(1)	2	3
3	2017	764	126	(2)	2	3
4	2018	756	128	(2)	2	4
5-year Goal	2019	749	130	(2)	2	4
6	2020	741	129	(2)	2	4
7	2021	741	128	(2)	2	4
8	2022	741	127	(2)	2	3
9	2023	741	126	(1)	2	3
10-year Goal	2024	741	125	(1)	2	3

[13] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for total GPCD from the utility's most recently submitted five-year water conservation plan was used.

3.3 Utility Water Conservation Plan Goals – Water Loss GPCD

Table 3-3 shows how Silverton's most recent water loss audit compares with five- and 10-year water loss goals in its water conservation plan. The following definitions pair with the column headers in Table 3-2.

Utility Population – Estimated utility service area population for the years indicated.

Water Loss GPCD Goals – Water loss GPCD goals start with the utility's baseline[14] for water loss GPCD and progress in subsequent years to match 5- and 10-year water loss goals indicated in a utility's five-year water conservation plan on file with the TWDB. The first five annual GPCD goals were developed by spreading the difference between the baseline and five-year goal evenly over five years. The second five annual GPCD goals spread the difference between the five-year goal and 10-year goal evenly over the next five years.

Yearly Savings Goal with Reduction in GPCD (MG) – This column shows what reductions from the baseline water loss GPCD would yield in terms of volume each year as more water is saved. The volumes indicated here are what target water loss GPCD goals look like expressed in million gallons. Annual volumes were derived using the formula: (baseline water loss GPCD – target water loss GPCD for that year) x 365 days ÷ 1,000,000 gallons.

Total Savings from Water Loss Reduction (MG) – The difference between a utility's established baseline for water loss GPCD and the most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB. If water loss GPCD has increased from the utility's baseline to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount. Reference Table 5-2 for savings from water loss reduction.

Over (Short) – The amount that the utility's total savings from water loss reduction is over or below the volume represented by reductions in GPCD each year. If water loss reduction savings are less than these target volumes, the value will appear in parentheses.

Table 3-3. Utility Water Conservation Plan Goals — Water Loss GPCD.

Year #	Year	Utility Population	Water Loss GPCD Goals	Yearly Savings Goal with Reduction in GPCD (MG)	Total Savings from Water Loss Reduction (MG)	Over (Short) (MG)
0	**Baseline**	-	10.00	0	0	0
1	2015	779	9.60	0.1	0.28	0.2
2	2016	771	9.20	0.2	0.28	0.1
3	2017	764	8.80	0.3	0.28	(0.1)
4	2018	756	8.40	0.4	0.28	(0.2)
5-year Goal	2019	749	8.00	0.5	0.27	(0.3)
6	2020	741	7.80	0.6	0.27	(0.3)
7	2021	741	7.60	0.6	0.27	(0.4)
8	2022	741	7.40	0.7	0.27	(0.4)
9	2023	741	7.20	0.8	0.27	(0.5)
10-year Goal	2024	741	7.00	0.8	0.27	(0.5)

[14] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.

4 Implemented Activities

Below is a list of completed activities with estimated water savings. Note that drought response and other measures are not included in the utility’s water savings because they are temporary, awareness-based or not able to be accurately quantified on an annual basis.

These are not savings projections of potential future activities. Estimated savings are based on measures that have actually been implemented. If savings are shown to persist in future years, it is because the measure is permanent, such as an ordinance, or the savings are assumed to continue for the reason listed under the itemized activity. Estimated savings from water rate increases are the one exception to these conditions.

Water Rate Increases

Savings from water rate increases were included because entities such as the U.S. Environmental Protection Agency and others indicate specific savings for utilities that raise rates (Texas Water Development Board, 2013; U.S. E.P.A., 1998; Whitcomb, 1999). This project includes surveys of several utilities that have minimal education efforts, perform no other substantive conservation activities, and yet experienced significant demand reduction that coincided with rate increases. In those cases, savings estimates matched up closely with decreases in total GPCD. For many smaller utilities, especially those with customers lacking disposable income, this measure is the only tool used to conserve other than water loss reduction.

The following assumptions were made for water rate increases:

- The model assumes that savings persist into future years because it is expected that the utility will continue to make periodic rate increases in line with the percentage increases from previous years.
- Only the last two rate increases for a utility were quantified.
- Savings grow with demand because as new customers enter the service area, they are assumed to adhere to the same price elasticity model estimates.
- A weighted average for savings was used when rate increases differed between residential and industrial-commercial-institutional (ICI) customers based on the individual utility's customer class breakdown.
- When a utility raised rates using tiered rate conservation pricing, a 50/50 savings split was used when increases differed between base and volumetric rates.
    - The reasoning is that all customers must react to the base increase, yet the pricing signal is stronger when volumetric rate increases affect the higher usage customers.
    - The 50/50 split is reasonable because many customers will not reach the higher volumetric tiers.
    - Studies show that most customers do not actually know they have reached the higher volumetric tiers; just that their bill has increased (Texas Water Development Board, 2013).

4.1 Itemized Activities

1. **Utility Website**
    a. Easy-to-use website with conservation tips and water rates
    b. Features contact information for Public Works staff and customer service

2. **Continuing Public Education**
    a. The utility engages the public in many ways including:
        i. Brochures, bill messages, displays, and exhibits

3. **Water Loss Reduction Savings**[15]
    a. Savings of .28 MG annually in 2015
    b. Water loss reduction savings = the difference between a utility's baseline[16] water loss GPCD submitted in its most recent 5-year water conservation plan and its most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB
    c. If water loss GPCD has increased from the utility's baseline or historic 5-year average to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount.
    d. All savings estimates grow each year at the same rate population figures for the utility grow in the regional water plan.

4. **Water Rate Increase**
    a. Last rate increase:[17]
        i. 7.0% increase in 2015
    b. Estimated customer demand reduction of 1.4%
    c. Savings is cumulative and based on more than one source[18] (U.S. EPA, 1998; Whitcomb, 1999)
    d. Savings from rate increases are shown to persist over time, however, note that savings from these pricing signals will likely decrease if rates remain the same in future years.

5. **Conservation Pricing and Water Rate Increases**
    a. Tiered rate structure in place saves approximately 2.5% of total demand
    b. Savings is cumulative and based on more than one source[19] (U.S. EPA, 1998; TWDB, 2013)

---

[15] If current water loss levels exceed a utility's baseline, this value is treated as a deduction from total quantified savings.
[16] In the absence of having a baseline figure provided in the utility's most recently submitted 5-year water conservation plan, the historic 5-year average for water loss GPCD in the plan was used.
[17] Correspondence with utility staff.
[18] We estimate 2% demand reduction with 10% increase in price on a targeted customer class. By applying a ratio, we can determine the savings for lower or higher percentage increases.
[19] The study estimates a 2% demand reduction with 10% increase in price on a targeted customer class. By applying a ratio, it is possible to determine the savings for lower or higher percentage increases.

5 Summary of Savings

Table 5-1. Savings by Water Conservation Activity (MG).

Year	Conservation Pricing	Water Rate Increase	TOTAL SAVINGS
2009			0
2010			0

6 Suggested Activities

Up to four activities were chosen as potential suggested activities for individual reports. These activities are: AMI system with customer portal, twice-per-week (or less) outdoor watering ordinances, strategic water rate increases, and rain barrels.

Activities were chosen because they are:

- Achievable
- Prevalence of vendors that can actually implement them
- Acceptability to city councils, MUD boards, et al.
- Easily adopted
- Cost effective
- Yield high savings relative to cost

AMI systems with customer engagement portals were also chosen because they represent a profusion of future applications that will undoubtedly continue to advance conservation efforts. AMI and meter data management (MDM) companies are developing new and innovative ways to benefit water providers, customers, and ultimately states that are pushing conservation and usage analytics further.

Each utility should be cognizant of the potential impact that these suggested activities may have on its own unique rate and revenue situation.

Benefits to consider:

- Avoided water supply and wastewater costs
  - The higher water purchase, transmission, and distribution costs are, the greater the potential benefit realized when large amounts of water are conserved with these activities.
- Avoided system expansion costs

  - Conserving water may allow a utility to postpone building new system capacity by decreasing demand even as population grows.

Costs to consider:

- Staff time and resources
- Unit cost per unit saved
- Implementation costs
- Stakeholder agreement and support
- Other overhead and budget considerations

6.1 Suggested Activities with Savings Estimates

1. Advanced Metering Infrastructure with Customer Engagement Portal

These portals, along with mobile applications and billing statements, can provide customers with much more access to their water use data in simple and compelling formats. This access and comparison with other customers' usage can reduce water use through changed behavior, as well as provide an opportunity for other conservation programs to be offered to the customer for increased adoption and additional savings. AMI systems support leak notification and web portals with real-time data. Any water loss reduction savings that these systems also yield were included in the water loss assessment of individual reports for this project.

a. Specific utility results will vary based on portal features and frequency of customer notifications.
b. Potential savings estimate assumes 20% of residential customers will use and save water due to the portal (Westin Engineering, 2015)
c. Estimate assumes customers will save 10% of total annual use due to the portal
   i. Savings estimate of 10% is an average of results from multiple studies (Chesnutt and Mitchell, 2013; East Bay Municipal Utility District, 2014; IBM, 2011; Texas A&M and Texas Water Resources Institute, 2016; Westin Engineering, 2015)
d. Residential customers' use assumed to make up approximately 67% of all retail customers' use based on utility profile information submitted to the TWDB
   i. This was the most common percentage of residential use among participating utilities in this project.
   ii. Actual customer class demand percentages will vary by utility.
e. 20% of residential customers saving 10% with this customer class breakdown amounts to 1.34% of total demand
f. Savings are assumed to increase along with demand as connections increase each year.[20]

[20] The 10% consumption reduction figure for 20% of residential customers is conservative, but savings could be greater when monitored yearly as customer engagement increases.

g. See Table 6-1 for potential savings from this measure compared with the utility's WMS supply volumes targets.

Table 6-1. Current Savings + Potential Savings from AMI with Customer Portal (MG).

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Potential Savings from AMI with Customer Portal	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)

Region P Individual Reports

Statewide Water Conservation Quantification Project
City of El Campo Report • 2017

1 Introduction

In Texas' 2017 State Water Plan, municipal water conservation is projected to meet 9.6 percent[1] of the state's future water needs by 2070. According to the 16 regional water plans that comprise the state water plan, this is expected to be achieved through a variety of measures such as installation of water efficient plumbing fixtures, water conservation pricing structures, water system audits, landscape irrigation ordinances, as well as other water conservation activities. The 9.6 percent is "in addition to the estimated share of future passive conservation savings from plumbing codes and water efficiency standards, which are embedded in municipal water demand projections" (Texas Water Development Board, 2017).

In 2015, the Texas Legislature appropriated funds to the Texas Water Development Board (TWDB) to fund a research project principally charged with quantitatively determining the savings of municipal water conservation activities being implemented in relation to the recommended conservation goals (supply volumes) in the State Water Plan. As part of the project, individual reports were completed for all participating utilities.

With this report, utilities will benefit by receiving a clear and concise picture of its water conservation goals alongside estimated savings from quantifiable activities. In the event that current activity savings may not be able to reach long-term goals, this report offers suggestions on how utilities can reach water conservation goals with activities that are effective, easily adopted, have widespread appeal, and are quantifiable.

2 Municipal Conservation Terminology and Review of Methodology Used by Regional Planners

To make use of the results of this study, it is important to understand several key terms used in the water planning process.

What is a water user group?

In this report, a water user group (WUG) refers to a retail water provider in the form a city, municipal utility district, water control and improvement district, special utility district, water supply corporation, fresh water supply district, or other type of water utility. The TWDB further defines WUGs as one of the following (Texas Water Development Board, 2016b):

- Cities and towns with a population of 500 or more
- Non-city utilities providing more than 280 acre-feet per year per year of water for municipal use
- Collective reporting units (CRUs) consisting of grouped utilities having a common association

[1] Equal to 811,224 acre-feet per year in conservation savings.

- County-Wide WUGs:
    - County-Other (Rural/unincorporated areas of municipal water use)
    - Manufacturing
    - Steam electric power generation

What is a recommended water management strategy?

A recommended water management strategy (WMS) is a measure that will help ensure WUGs have adequate water supplies for their end users well into the future. WMS examples include river diversions, groundwater use, reservoir and aquifer development, and irrigation conservation. When WMS is referred to in this report, it refers only to municipal conservation, which may include water loss reduction as a part of the same strategy.

What is a WMS supply volume?

A WMS supply volume is the amount of water that a given strategy is expected to yield each decade in the planning period if carried out by the WUG. In this report, a WMS supply volume is the amount of water recommended to come from municipal water conservation.

Some regional water plans separate this strategy's supply volume into a volume for municipal water conservation and a volume for water loss reduction for each decade. The total strategy supply volume is the sum of both. A regional water plan may also refer to "advanced conservation" as part of this strategy. Advanced conservation usually indicates that the volume could be achieved through a more robust mix of conservation activities described in the plan.

2.1 Regional Planning Group Approach to Determining Supply Volumes

Each regional water planning group (RWPG) is responsible for producing its own individual plan that, if executed, will provide sufficient water to its WUGs throughout a 50-year planning period. These plans are completed in five-year cycles, with the most recent edition being completed in 2016. The 2016 regional plans make up the 2017 State Water Plan, which sets out WMS supply volumes for the years 2020 through 2070.

The decadal WMS supply volumes for municipal conservation were established by each of the RWPGs in much the same manner. The RWPGs generally followed the guidelines of the Texas Legislature's Water Conservation Implementation Task Force on the pace utilities should target to reduce gallons per capita per day (GPCD)[2] consumption levels.

The targeted reductions used by most regions follow this formula:

- For municipal WUGs with water use of 140 GPCD and greater, the goal is to reduce per capita water use by one percent per year until the level of 140 GPCD is reached,

[2] Regional water planning GPCD is defined as the annual volume of water pumped, diverted, or purchased minus the volume exported (sold) to other water systems or large industrial facilities divided by the permanent resident population of the Municipal Water User Group in the regional water planning process divided by 365. Saline and reused/recycled water are not included in this volume (Texas Water Development Board, 2012).

after which, the goal is to reduce per capita water use by one-fourth percent per year for the remainder of the planning period (Texas Water Development Board, 2016j).

The yearly reductions in GPCD for a given WUG are then converted into recommended supply volumes in acre-feet per year for each decade as the reductions in consumption continue. Some regions reduce GPCD by slightly different percentages before and after the 140 GPCD threshold, some do not apply further reductions in GPCD for WUGs once they reach 140 GPCD, while others recommend only "advanced conservation" activities once WUGs meet 140 GPCD.

2.2 Methodology

In order to complete a uniform quantification process, the first engagement was with utilities that agreed to participate and collected as much relevant data as possible. These data included, among many others, historical GPCD consumption figures, advanced metering infrastructure (AMI) specifications, and detailed feedback on each conservation activity being implemented. Personal interviews focused on determining when and to what extent these activities were being employed, as well as assessing plans to continue such conservation. Examples of frequently implemented activities include tiered water rate conservation pricing, strategic water rate increases, outdoor irrigation audits and ordinances, and rain barrel distribution.

Subsequently, each utility's conservation activities were quantified through several different means, including evidence-based studies, utility field results and savings determinations, manufacturer guarantees, water loss audits, TWDB studies, and other information that assigned a savings value to the activity's implementation.

Every conservation activity studied and quantified has a gallons-per-year estimate, useful life, and decay rate (if applicable) associated with it. Some activities' savings are projected to grow as demand grows over time, while some savings are constant each year and subside once useful life has run its course. For expanded methodology and details on studies and formulas used to determine activity savings, refer to Section 6 of the State Report included as part of this document.

Once analyzed, the resulting savings estimates from each utility were compared with the recommended WMS supply volumes in its respective regional plan to determine if the savings met, exceeded, or fell short of those volumes. Individual utility savings were aggregated to compare with regional volumes, and regional savings were aggregated to compare with state volumes.

It is important to note that this report quantified activity savings—not including water loss reduction—for the WMS supply volume comparison dating back to 2012. The reason for this is, with a few exceptions, the regional planners used 2011 as the base year for establishing potential WMS supply volumes.[3] In addition, any conservation savings achieved through 2011 are assumed to be accounted for in the regional water planning GPCD for that year.[4] Thus, quantifying from 2012 and forward is the most accurate way to determine if utilities are meeting

[3] Confirmed via personal communication with Region C, H, K, and L Plan consultants.
[4] It was established with TWDB planning staff that 2011 GPCD levels were chosen because they represented the most current water use and conservation patterns at the time.

the recommended conservation volumes in the regional plans. This assumption is by no means 100 percent accurate, however. Some previously implemented activities' savings persist into future years beyond this starting point, while some activities' savings have ceased. One year's GPCD will not necessarily include all savings yielded by conservation activities that came before it, but the quantification assessment must have a starting point.

2.3 Quantifiable Savings

The key to the project being useful and reliable is that the results from year to year are measurable. Quantifying conservation activities that can be accurately measured provides greater certainty and better planning for all stakeholders.

While many utilities are engaged in a variety of conservation activities, not all can currently be properly measured. Some examples of these activities include education initiatives, website and social media engagement, and enforcement for water waste. That does not mean these measures are not essential. Education of consumers, for example, is a fundamental activity that makes all others effective, but little hard data exists to quantify the results of education alone.

In addition, the work of conservation coordinators can have a particularly significant effect on the savings of all other activities, but the specific savings attributed to that staff role is difficult to quantify.

3 Results

This report compares El Campo's current water conservation activities and their quantified savings to two metrics: 1) Region P Water Plan's (Texas Water Development Board, 2016n) recommended WMS supply volumes for municipal conservation, and 2) El Campo's own 5- and 10-year goals as established in its most recent water conservation plan submitted to the TWDB.

The WMS supply volumes for municipal water conservation are laid out by decade (2020 – 2070) in the regional water plans to serve as benchmarks for what each utility could achieve via that strategy during a 50-year planning period.

The 5- and 10-year goals in El Campo's most recent water conservation plan are established by the utility as realistic targets for reducing consumption over that timeframe. These reductions[5] are expressed in decreasing total GPCD [6] consumption and water loss GPCD.[7] [8]

The estimated savings in Tables 3-1 through 3-3 indicate the best information available as provided by utility staff. Some ongoing activities may not be known and are within a utility's service area are implemented on a micro-scale that may not be quantified. Individual households and businesses may be implementing conservation measures that are unknown and therefore cannot be included in the report.

---

[5] Occasionally, some utilities expect consumption to increase due to various reasons, such as an incoming industrial presence expected to raise consumption figures for the entire service area.

[6] As defined in TWDB water conservation annual reports: (Total Gallons in System ÷ Permanent Population) ÷ 365

[7] These plans also have targets for residential GPCD and water loss as a percentage (rather than GPCD), but this report does not address those goals.

[8] As defined in annual TWDB water loss audits: (Total Water Loss ÷ Permanent Population) ÷ 365

Explanation of approach to assessing water loss reduction savings

Water loss reduction savings are defined as the volume of water participating utilities are realizing from their water loss mitigation efforts. For this report, this value is the difference between each individual utility's baseline[9] for water loss GPCD and its most recent water loss GPCD reported in 2015 water loss audits on file with TWDB. Savings from all water loss reduction efforts—including pipe replacements and leak repair—are assumed to be included in this comparison to a utility's baseline.

Note that because a single year (2015) value was used for comparison, it is possible that the 2015 value could be anomalous due to a number of events that may have occurred that year, such as a water main break, a particularly wet year, or a robust effort by the utility to curtail water loss. This will distort future savings figures that were carried forward in the study because water loss will inevitably increase or decrease in later years.

Ideally, using a rolling five-year average in the calculation would correct such anomalies. However, there was insufficient data to do that for every utility. The approach was to use the most complete water loss data possible, which was represented by the 2015 water loss audit. This problem will be further minimized, as continued data collection will allow five-year averages to be calculated for a majority of utilities.

In this way, water loss savings estimates are different from all other activity savings estimates in the project. Whether savings were positive or negative depended on where individual utilities established their own baselines or where their five-year average started, and what water loss GPCD value was reported in 2015.

3.1 Current Savings Compared to Conservation WMS Supply Volume (in Million Gallons) in Regional Water Plan

Table 3-1 shows the 2070 outlook for El Campo with the utility's yearly recommended WMS supply volume in million gallons (MG) alongside its water savings from implemented activities, including from water loss reduction. These activities and their associated savings are covered in greater detail in Sections 4 and 5.

Starting in 2015, this table compares all quantified conservation activity and the recommended conservation WMS supply volume for the planning period. The following definitions pair with the column headers in Table 3-1.

Actual Current Conservation Activity Savings – All quantified activities currently being performed by the utility, *excluding* savings from water loss reduction. The regional planners used 2011 GPCD as the baseline for determining future conservation WMS supply volumes, therefore the study quantifies utility savings starting in 2012 for this comparison. The summary of these savings can be referenced in Table 5-1.

[9] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.

Actual Water Loss Reduction Savings (as of 2015) – The difference between the baseline[10] for water loss GPCD and most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB. [11] The summary of these savings can be referenced in Table 5-2.

Total Savings from All Conservation Activity – Actual Current Conservation Activity Savings plus Actual Water Loss Reduction Savings (as of 2015).

Conservation WMS Volume – The recommended municipal water conservation supply volume in the regional plan for the decades ranging from 2020 to 2070. These volumes are converted to MG from the values listed in the plan in acre-feet and then calculated in annual increments.

Water Loss Reduction WMS Volume – Some regional water plans have a separate WMS volume for water conservation and for water loss reduction for each decade. If a WUG's regional plan has a WMS volume for water loss reduction, this column will have values other than zero.

Total Yearly WMS Volume – The sum of the Conservation WMS Volume and Water Loss Reduction WMS Volume.

Over (Short) – The amount that the utility's Total Savings from All Conservation Activity (since 2012), is over or below the Total Yearly WMS Volume in the regional water plan. If the amount falls below the WMS volume, it will appear in parentheses.

[10] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.
[11] If water loss GPCD has increased from the utility's baseline or historic five-year average to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount.

Table 3-1. Current Savings Compared to Conservation WMS Supply Volume (MG) in Regional Water Plan.

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)
2015	32	13.2	45	16	0	16	29

3.2 Utility Water Conservation Plan Goals – Total GPCD

Table 3-2 shows how El Campo's quantified savings from its implemented activities compare with 5- and 10-year goals established in its individual water conservation plan submitted to the TWDB. The following definitions pair with the column headers in Table 3-2.

Utility Population – Estimated utility service area population for the years indicated.

Total GPCD Goals – Total GPCD goals start with the utility's baseline[12] for total GPCD and progress in subsequent years to match 5- and 10-year goals indicated in a utility's five-year water conservation plan on file with the TWDB. The first five annual GPCD goals were developed by spreading the difference between the baseline and five-year goal evenly over five years. The second five annual GPCD goals spread the difference between the five-year goal and 10-year goal evenly over the next five years.

Annual Savings Goal with Reduction in GPCD (MG) – This column shows what reductions from the baseline GPCD would yield in terms of volume each year as more water is saved. The volumes indicated here are what target GPCD goals look like expressed in million gallons. Annual volumes were derived using the formula: (baseline total GPCD – target total GPCD for that year) x 365 days ÷ 1,000,000 gallons.

Total Savings for All Current Quantified Activities (MG) – Total quantified savings for all current conservation activities and savings from water loss reduction. Refer to Tables 5-1 and 5-2 for details on these savings.

Over (Short) – The amount that the utility's total quantified savings for all current conservation activities (since 2012), including water loss reduction, is over or below the volume represented by reductions in GPCD each year. If the quantified savings are less than these target volumes, the value will appear in parentheses.

Table 3-2. Utility Water Conservation Plan Goals — Total GPCD.

Year #	Year	Utility Population	Total GPCD Goals	Annual Savings Goal with Reduction in GPCD (MG)	Total Savings for All Current Quantified Activities (MG)	Over (Short) (MG)
0	**Baseline**	-	153	0	0	0
1	2015	12,084	146	29	45	16
2	2016	12,089	140	58	45	(13)
3	2017	12,095	133	87	45	(42)
4	2018	12,100	127	117	45	(71)
5-year Goal	2019	12,106	120	146	45	(101)
6	2020	12,111	119	149	45	(104)
7	2021	12,168	118	154	45	(108)
8	2022	12,224	118	158	46	(112)
9	2023	12,281	117	162	46	(117)
10-year Goal	2024	12,337	116	167	46	(121)

[12] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for total GPCD from the utility's most recently submitted five-year water conservation plan was used.

3.3 Utility Water Conservation Plan Goals – Water Loss GPCD

Table 3-3 shows how El Campo's most recent water loss audit compares with 5- and 10-year water loss goals in its water conservation plan. The following definitions pair with the column headers in Table 3-2.

Utility Population – Estimated utility service area population for the years indicated.

Water Loss GPCD Goals – Water loss GPCD goals start with the utility's baseline[13] for water loss GPCD and progress in subsequent years to match 5- and 10-year water loss goals indicated in a utility's five-year water conservation plan on file with the TWDB. The first five annual GPCD goals were developed by spreading the difference between the baseline and five-year goal evenly over five years. The second five annual GPCD goals spread the difference between the five-year goal and 10-year goal evenly over the next five years.

Yearly Savings Goal with Reduction in GPCD (MG) – This column shows what reductions from the baseline water loss GPCD would yield in terms of volume each year as more water is saved. The volumes indicated here are what target water loss GPCD goals look like expressed in million gallons. Annual volumes were derived using the formula: (baseline water loss GPCD – target water loss GPCD for that year) x 365 days ÷ 1,000,000 gallons.

Total Savings from Water Loss Reduction (MG) – The difference between a utility's established baseline for water loss GPCD and the most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB. If water loss GPCD has increased from the utility's baseline to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount. Reference Table 5-2 for savings from water loss reduction.

Over (Short) – The amount that the utility's total savings from water loss reduction is over or below the volume represented by reductions in GPCD each year. If water loss reduction savings are less than these target volumes, the value will appear in parentheses.

Table 3-3. Utility Water Conservation Plan Goals — Water Loss GPCD.

Year #	Year	Utility Population	Water Loss GPCD Goals	Yearly Savings Goal with Reduction in GPCD (MG)	Total Savings from Water Loss Reduction (MG)	Over (Short) (MG)
0	**Baseline**	-	16.00	0	0	0
1	2015	12,084	18.00	(9)	13.2	22
2	2016	12,089	20.00	(18)	13.2	31
3	2017	12,095	22.00	(26)	13.2	40
4	2018	12,100	24.00	(35)	13.2	49
5-year Goal	2019	12,106	26.00	(44)	13.3	57
6	2020	12,111	24.40	(37)	13.3	50
7	2021	12,168	22.80	(30)	13.3	44
8	2022	12,224	21.20	(23)	13.4	37
9	2023	12,281	19.60	(16)	13.4	30
10-year Goal	2024	12,337	18.00	(9)	13.5	23

[13] In the absence of having a baseline figure provided by the TWDB or utility staff, the historic five-year average for water loss GPCD from the utility's most recently submitted five-year water conservation plan was used.

4 Implemented Activities

Below is a list of completed activities with estimated water savings. Note that drought response and other measures are not included in the utility's water savings because they are temporary, awareness-based or not able to be accurately quantified on an annual basis.

These are not savings projections of potential future activities. Estimated savings are based on measures that have actually been implemented. If savings are shown to persist in future years, it is because the measure is permanent, such as an ordinance, or the savings are assumed to continue for the reason listed under the itemized activity. Estimated savings from water rate increases are the one exception to these conditions.

Water Rate Increases

Savings from water rate increases were included because entities such as the U.S. Environmental Protection Agency and others indicate specific savings for utilities that raise rates (Texas Water Development Board, 2013; U.S. E.P.A., 1998; Whitcomb, 1999). This project includes surveys of several utilities that have minimal education efforts, perform no other substantive conservation activities, and yet experienced significant demand reduction that coincided with rate increases. In those cases, savings estimates matched up closely with decreases in total GPCD. For many smaller utilities, especially those with customers lacking disposable income, this measure is the only tool used to conserve other than water loss reduction.

The following assumptions were made for water rate increases:

- The model assumes that savings persist into future years because it is expected that the utility will continue to make periodic rate increases in line with the percentage increases from previous years.
- Only the last two rate increases for a utility were quantified.
- Savings grow with demand because as new customers enter the service area, they are assumed to adhere to the same price elasticity model estimates.
- A weighted average for savings was used when rate increases differed between residential and industrial-commercial-institutional (ICI) customers based on the individual utility's customer class breakdown.
- When a utility raised rates using tiered rate conservation pricing, a 50/50 savings split was used when increases differed between base and volumetric rates.
    - The reasoning is that all customers must react to the base increase, yet the pricing signal is stronger when volumetric rate increases affect the higher usage customers.
    - The 50/50 split is reasonable because many customers will not reach the higher volumetric tiers.
    - Studies show that most customers do not actually know they have reached the higher volumetric tiers; just that their bill has increased (Texas Water Development Board, 2013).

4.1 Itemized Activities

1. **Utility Website**
   a. Easy-to-use website with conservation tips and water rates
   b. Features contact information for Public Works staff and customer service

2. **Continuing Public Education**
   a. The utility engages the public in many ways including:
      i. Brochures, bill messages, displays, and exhibits

3. **Water Loss Reduction Savings**[14]
   a. Savings of 13.23 MG annually in 2015
   b. Water loss reduction savings = the difference between a utility's baseline[15] water loss GPCD submitted in its most recent 5-year water conservation plan and its most recent water loss GPCD reported in the 2015 water loss audit on file with TWDB
   c. If water loss GPCD has increased from the utility's baseline or historic 5-year average to its reported 2015 water loss audit level, then this value will appear negative because more water is being lost than the baseline amount.
   d. All savings estimates grow each year at the same rate population figures for the utility grow in the regional water plan.

4. **Water Rate Increase**
   a. Last rate increase:[16]
      i. 15.0% increase in 2014
   b. Estimated customer demand reduction of 3.0%
   c. Savings is cumulative and based on more than one source[17] (U.S. EPA, 1998; Whitcomb, 1999)
   d. Savings from rate increases are shown to persist over time, however, note that savings from these pricing signals will likely decrease if rates remain the same in future years.

[14] If current water loss levels exceed a utility's baseline, this value is treated as a deduction from total quantified savings.
[15] In the absence of having a baseline figure provided in the utility's most recently submitted 5-year water conservation plan, the historic 5-year average for water loss GPCD in the plan was used.
[16] Correspondence with utility staff.
[17] The study estimates a 2% demand reduction with 10% increase in price on a targeted customer class. By applying a ratio, it is possible to determine the savings for lower or higher percentage increases.

5 Summary of Savings

Table 5-1. Savings by Water Conservation Activity (MG).

Year	Water Rate Increases	TOTAL SAVINGS
2009	0	0
2010	0	0
2011	0	0
2012	0	0
2013	0	0
2014	2.9	3
2015	31.8	32
2016	31.8	32
2017	31.9	32
2018	32.0	32
2019	32.0	32
2020	32.1	32
2021	32.2	32
2022	32.2	32
2023	32.3	32
2024	32.4	32
2025	32.4	32
2026	32.5	32
2027	32.6	33
2028	32.6	33
2029	32.7	33
2030	32.8	33

2032	32.9	33
2033	32.9	33
2034	33.0	33
2035	33.0	33
2036	33.1	33
2037	33.1	33
2038	33.2	33
2039	33.2	33
2040	33.3	33
2041	33.3	33
2042	33.4	33
2043	33.5	33
2044	33.5	34
2045	33.6	34
2046	33.7	34
2047	33.7	34
2048	33.8	34
2049	33.9	34
2050	33.9	34
2051	34.0	34
2052	34.1	34
2053	34.2	34
2054	34.3	34
2055	34.3	34
2056	34.4	34
2057	34.5	35
2058	34.6	35
2059	34.7	35
2060	34.8	35
2061	34.8	35
2062	34.9	35
2063	35.0	35
2064	35.1	35
2065	35.2	35
2066	35.2	35
2067	35.3	35
2068	35.4	35
2069	35.5	35
2070	35.6	36

Table 5-2. Savings from Water Loss Reduction (MG).

Year	Utility Population	Water Loss GPCD	Total Savings from Water Loss Reduction
Baseline	-	16.00	0
2015	12,084	13.00	13.24
2016	12,089	13.00	13.24
2017	12,095	13.00	13.24
2018	12,100	13.00	13.25
2019	12,106	13.00	13.26
2020	12,111	13.00	13.26
2021	12,168	13.00	13.32
2022	12,224	13.00	13.39
2023	12,281	13.00	13.45
2024	12,337	13.00	13.51

6 Suggested Activities

Up to four activities were chosen as potential suggested activities for individual reports. These activities are: AMI system with customer portal, twice-per-week (or less) outdoor watering ordinances, strategic water rate increases, and rain barrels.

Activities were chosen because they are:

- Achievable
- Prevalence of vendors that can actually implement them
- Acceptability to city councils, MUD boards, et al.
- Easily adopted
- Cost effective
- Yield high savings relative to cost

AMI systems with customer engagement portals were also chosen because they represent a profusion of future applications that will undoubtedly continue to advance conservation efforts. AMI and meter data management (MDM) companies are developing new and innovative ways to benefit water providers, customers, and ultimately states that are pushing conservation and usage analytics further.

Each utility should be cognizant of the potential impact that these suggested activities may have on its own unique rate and revenue situation.

Benefits to consider:

- Avoided water supply and wastewater costs
    - The higher water purchase, transmission, and distribution costs are, the greater the potential benefit realized when large amounts of water are conserved with these activities.
- Avoided system expansion costs

- Conserving water may allow a utility to postpone building new system capacity by decreasing demand even as population grows.

Costs to consider:

- Staff time and resources
- Unit cost per unit saved
- Implementation costs
- Stakeholder agreement and support
- Other overhead and budget considerations

6.1 Suggested Activities with Savings Estimates

1. Advanced Metering Infrastructure with Customer Engagement Portal

These portals, along with mobile applications and billing statements, can provide customers with much more access to their water use data in simple and compelling formats. This access and comparison with other customers' usage can reduce water use through changed behavior, as well as provide an opportunity for other conservation programs to be offered to the customer for increased adoption and additional savings. AMI systems support leak notification and web portals with real-time data. Any water loss reduction savings that these systems also yield were included in the water loss assessment of individual reports for this project.

a. Specific utility results will vary based on portal features and frequency of customer notifications.
b. Potential savings estimate assumes 20% of residential customers will use and save water due to the portal (Westin Engineering, 2015)
c. Estimate assumes customers will save 10% of total annual use due to the portal
    i. Savings estimate of 10% is an average of results from multiple studies (Chesnutt and Mitchell, 2013; East Bay Municipal Utility District, 2014; IBM, 2011; Texas A&M and Texas Water Resources Institute, 2016; Westin Engineering, 2015)
d. Residential customers' use assumed to make up approximately 67% of all retail customers' use based on utility profile information submitted to the TWDB
    i. This was the most common percentage of residential use among participating utilities in this project.
    ii. Actual customer class demand percentages will vary by utility.
e. 20% of residential customers saving 10% with this customer class breakdown amounts to 1.34% of total demand
f. Savings are assumed to increase along with demand as connections increase each year.[18]

[18] The 10% consumption reduction figure for 20% of residential customers is conservative, but savings could be greater when monitored yearly as customer engagement increases.

g. See Table 6-1 for potential savings from this measure compared with the utility's WMS supply volumes targets.

Table 6-1. Current Savings + Potential Savings from AMI with Customer Portal (MG).

Year	Actual Current Conservation Activity Savings	Actual Water Loss Reduction Savings (as of 2015)	Total Savings from All Conservation Activity	Potential Savings from AMI with Customer Portal	Conservation WMS Volume	Water Loss Reduction WMS Volume	Total Yearly WMS Volume	Over (Short)
2016	32	13	45	10	20	0	20	35
2017	32	13	45	10	20	0	20	35
2018	32	13	45	10	24	0	24	31
2019	32	13	45	10	28	0	28	28
