| 36   | 14     | 13043 | Mertzon | M         | TX180002  | 700        | As a result of the recent historic ongoing drought, the City’s water supply is still depleted. The City currently has five (5) functional groundwater wells (of the original eight), caused by continual pumping during the ongoing drought, and is in the process of obtaining approval for a new sixth well. The City has observed a steady decrease in production from its wells over the past several years, to the point that three of the original eight wells are essentially “dry” at this time. As the water supply has dwindled, the quality of the water no longer meets secondary drinking water quality standards. In order to support current water supply needs with water that meets current drinking water quality standards, the City of Mertzon is pursuing implementation of a major project to install a treatment system to address the City’s groundwater quality issues. | PDC              | $2,797,000.00 | Yes-BC   | $2,797,000.00 |

<td>The City is currently undertaking the effort to develop a preliminary asset management plan for their water system infrastructure. The scoring system for the condition of facilities was based on several criteria such as pipeline diameter, material, age, capacity, history of repairs and criticality. For above ground facilities some of the criteria included electrical, mechanical, site, structural, etc. For each asset an overall risk score was assigned. The City is seeking this funding to expand on their preliminary asset management efforts to include a full master plan with hydraulic modeling. Through the effort those assets that were identified at high risk of failure and are highly critical have been mapped and preliminary cost estimates have been developed. This project will fund the additional asset management and master planning efforts and the rehabilitation of infrastructure identified as high risk. In addition, the City will install an AMI metering system.</td>

<td>Applicants groundwater PWS serves Clear Creek Shores Se9 2 on Massengale Lane, a very small system with 28 customers located in south Harris County Texas. This IOU water system is 40+ years old, galvanized well casing beyond its useful life, and rusted pressure tank on verge of collapse. The well site located in hazard floodway is increasingly subject to flooding events jeopardizing system integrity. For example, all metals analysis after Hurricane Harvey reports elevated Calcium Carbonate levels exceeding 700 mg/l suggests a fluctuating aquifer is precipitating dissolved minerals in pumpage cone of depression. By comparison, CaCO3 prior to Harvey was 50 mg/l. In addition, alkalinity after Harvey at 375 mg/l (2X normal levels) is corroding pumpage equipment and scaling distribution lines reducing efficiency, and corrosive to home appliances. The idea of homeowners utilizing water softeners to mitigate supply line alkalinity is not an option in subdivision with on-site wastewater system.</td>

<td>The City of Bay City (City) is not currently able to meet their desired level of service for water plant capacity and pressure requirements due to the increasing number of connections throughout the service area and lack of redundancy throughout the distribution system. This project will consist of the design and construction of two new water plants and the addition of a 12&quot; transmission line to loop the system and reduce the likelihood of outages. Additionally, this project will address numerous water system-related improvement projects originally included in the City’s Capital Improvement Program (CIP). This project will enable the City to consistently meet the TCEQ’s requirements by increasing pressure within the distribution lines and adding capacity in order to be able to serve the current number of connections located within the City and more as the City’s population increases as projected.</td>
