

August 22, 2018

Mr. Winton Milliff
Coke County Underground Water Conservation District
P.O. Box 1110
Robert Lee, TX 76945

Dear Mr. Milliff:

Texas Water Code, Section 36.1084, Subsection (b) states that the Texas Water Development Board’s (TWDB) Executive Administrator shall provide each groundwater conservation district and regional water planning group located wholly or partly in the groundwater management area with the modeled available groundwater in the management area based upon the desired future conditions adopted by the districts. This letter and the attached report (GAM Run 16-026 MAG) are in response to this directive.

District representatives in Groundwater Management Area 7 adopted desired future conditions for the Dockum, Ellenburger-San Saba, Hickory, Ogallala, and Rustler aquifers on September 22, 2016 and the Capitan Reef Complex Aquifer on March 23, 2017 and adopted revised desired future conditions for the Edwards-Trinity (Plateau), Pecos Valley, and Trinity aquifers on March 22, 2018. The TWDB received the desired future condition explanatory reports and related materials from the Groundwater Management Area 7 consultant, Dr. William R. Hutchison, on November 28, 2016 and March 28, 2018.

Texas Water Code, Section 36.001, Subsection (25) defines modeled available groundwater as “the amount of water that the executive administrator determines may be produced on an average annual basis to achieve a desired future condition established under Section 36.108.” We report modeled available groundwater estimates by aquifer, groundwater conservation district, county, regional water planning area, and river basin for use by groundwater conservation districts and for use in the regional water planning process.

I encourage open communication and coordination between groundwater conservation districts, regional water planning groups, and the TWDB to ensure that the modeled available groundwater reported in regional water plans and groundwater management plans are not in conflict. The estimates of modeled available groundwater are the pumping volumes that would have to occur to achieve the desired future conditions using the best available scientific tools. However, these estimates are based on assumptions of the magnitude and distribution of projected pumping in the aquifer. It is, therefore, important for groundwater conservation districts to monitor whether their management of pumping is achieving their desired future conditions. I encourage districts to continue to work with us to better define modeled available groundwater as additional information may help better assess responses of the aquifer to pumping and the distribution of pumping now and in the future.

Our Mission

To provide leadership, information, education, and support for planning, financial assistance, and outreach for the conservation and responsible development of water for Texas

August 22, 2018

Mr. Slate Williams
Crockett County Groundwater Conservation District
P.O. Box 1458
Ozona, TX 76943

Dear Mr. Williams:

Texas Water Code, Section 36.1084, Subsection (b) states that the Texas Water Development Board's (TWDB) Executive Administrator shall provide each groundwater conservation district and regional water planning group located wholly or partly in the groundwater management area with the modeled available groundwater in the management area based upon the desired future conditions adopted by the districts. This letter and the attached report (GAM Run 16-026 MAG) are in response to this directive.

District representatives in Groundwater Management Area 7 adopted desired future conditions for the Dockum, Ellenburger-San Saba, Hickory, Ogallala, and Rustler aquifers on September 22, 2016 and the Capitan Reef Complex Aquifer on March 23, 2017 and adopted revised desired future conditions for the Edwards-Trinity (Plateau), Pecos Valley, and Trinity aquifers on March 22, 2018. The TWDB received the desired future condition explanatory reports and related materials from the Groundwater Management Area 7 consultant, Dr. William R. Hutchison, on November 28, 2016 and March 28, 2018.

Texas Water Code, Section 36.001, Subsection (25) defines modeled available groundwater as "the amount of water that the executive administrator determines may be produced on an average annual basis to achieve a desired future condition established under Section 36.108." We report modeled available groundwater estimates by aquifer, groundwater conservation district, county, regional water planning area, and river basin for use by groundwater conservation districts and for use in the regional water planning process.

I encourage open communication and coordination between groundwater conservation districts, regional water planning groups, and the TWDB to ensure that the modeled available groundwater reported in regional water plans and groundwater management plans are not in conflict. The estimates of modeled available groundwater are the pumping volumes that would have to occur to achieve the desired future conditions using the best available scientific tools. However, these estimates are based on assumptions of the magnitude and distribution of projected pumping in the aquifer. It is, therefore, important for groundwater conservation districts to monitor whether their management of pumping is achieving their desired future conditions. I encourage districts to continue to work with us to better define modeled available groundwater as additional information may help better assess responses of the aquifer to pumping and the distribution of pumping now and in the future.

August 22, 2018

Ms. Genell Hobbs
Kinney County Groundwater Conservation District
P.O. Box 369
Bracketville, TX 78832

Dear Ms. Hobbs:

Texas Water Code, Section 36.1084, Subsection (b) states that the Texas Water Development Board's (TWDB) Executive Administrator shall provide each groundwater conservation district and regional water planning group located wholly or partly in the groundwater management area with the modeled available groundwater in the management area based upon the desired future conditions adopted by the districts. This letter and the attached report (GAM Run 16-026 MAG) are in response to this directive.

District representatives in Groundwater Management Area 7 adopted desired future conditions for the Dockum, Ellenburger-San Saba, Hickory, Ogallala, and Rustler aquifers on September 22, 2016 and the Capitan Reef Complex Aquifer on March 23, 2017 and adopted revised desired future conditions for the Edwards-Trinity (Plateau), Pecos Valley, and Trinity aquifers on March 22, 2018. The TWDB received the desired future condition explanatory reports and related materials from the Groundwater Management Area 7 consultant, Dr. William R. Hutchison, on November 28, 2016 and March 28, 2018.

Texas Water Code, Section 36.001, Subsection (25) defines modeled available groundwater as "the amount of water that the executive administrator determines may be produced on an average annual basis to achieve a desired future condition established under Section 36.108." We report modeled available groundwater estimates by aquifer, groundwater conservation district, county, regional water planning area, and river basin for use by groundwater conservation districts and for use in the regional water planning process.

I encourage open communication and coordination between groundwater conservation districts, regional water planning groups, and the TWDB to ensure that the modeled available groundwater reported in regional water plans and groundwater management plans are not in conflict. The estimates of modeled available groundwater are the pumping volumes that would have to occur to achieve the desired future conditions using the best available scientific tools. However, these estimates are based on assumptions of the magnitude and distribution of projected pumping in the aquifer. It is, therefore, important for groundwater conservation districts to monitor whether their management of pumping is achieving their desired future conditions. I encourage districts to continue to work with us to better define modeled available groundwater as additional information may help better assess responses of the aquifer to pumping and the distribution of pumping now and in the future.

August 22, 2018

Mr. Allan Lange
Lipan-Kickapoo Water Conservation District
P.O. Box 67
Vancourt, TX 76955

Dear Mr. Lange:

Texas Water Code, Section 36.1084, Subsection (b) states that the Texas Water Development Board's (TWDB) Executive Administrator shall provide each groundwater conservation district and regional water planning group located wholly or partly in the groundwater management area with the modeled available groundwater in the management area based upon the desired future conditions adopted by the districts. This letter and the attached report (GAM Run 16-026 MAG) are in response to this directive.

District representatives in Groundwater Management Area 7 adopted desired future conditions for the Dockum, Ellenburger-San Saba, Hickory, Ogallala, and Rustler aquifers on September 22, 2016 and the Capitan Reef Complex Aquifer on March 23, 2017 and adopted revised desired future conditions for the Edwards-Trinity (Plateau), Pecos Valley, and Trinity aquifers on March 22, 2018. The TWDB received the desired future condition explanatory reports and related materials from the Groundwater Management Area 7 consultant, Dr. William R. Hutchison, on November 28, 2016 and March 28, 2018.

Texas Water Code, Section 36.001, Subsection (25) defines modeled available groundwater as "the amount of water that the executive administrator determines may be produced on an average annual basis to achieve a desired future condition established under Section 36.108." We report modeled available groundwater estimates by aquifer, groundwater conservation district, county, regional water planning area, and river basin for use by groundwater conservation districts and for use in the regional water planning process.

I encourage open communication and coordination between groundwater conservation districts, regional water planning groups, and the TWDB to ensure that the modeled available groundwater reported in regional water plans and groundwater management plans are not in conflict. The estimates of modeled available groundwater are the pumping volumes that would have to occur to achieve the desired future conditions using the best available scientific tools. However, these estimates are based on assumptions of the magnitude and distribution of projected pumping in the aquifer. It is, therefore, important for groundwater conservation districts to monitor whether their management of pumping is achieving their desired future conditions. I encourage districts to continue to work with us to better define modeled available groundwater as additional information may help better assess responses of the aquifer to pumping and the distribution of pumping now and in the future.

Our Mission

To provide leadership, information, education, and support for planning, financial assistance, and outreach for the conservation and responsible development of water for Texas

August 22, 2018

Mr. Scott Holland
Sterling County Underground Water Conservation District
P.O. Box 873
Sterling City, TX 76951

Dear Mr. Holland:

Texas Water Code, Section 36.1084, Subsection (b) states that the Texas Water Development Board's (TWDB) Executive Administrator shall provide each groundwater conservation district and regional water planning group located wholly or partly in the groundwater management area with the modeled available groundwater in the management area based upon the desired future conditions adopted by the districts. This letter and the attached report (GAM Run 16-026 MAG) are in response to this directive.

District representatives in Groundwater Management Area 7 adopted desired future conditions for the Dockum, Ellenburger-San Saba, Hickory, Ogallala, and Rustler aquifers on September 22, 2016 and the Capitan Reef Complex Aquifer on March 23, 2017 and adopted revised desired future conditions for the Edwards-Trinity (Plateau), Pecos Valley, and Trinity aquifers on March 22, 2018. The TWDB received the desired future condition explanatory reports and related materials from the Groundwater Management Area 7 consultant, Dr. William R. Hutchison, on November 28, 2016 and March 28, 2018.

Texas Water Code, Section 36.001, Subsection (25) defines modeled available groundwater as "the amount of water that the executive administrator determines may be produced on an average annual basis to achieve a desired future condition established under Section 36.108." We report modeled available groundwater estimates by aquifer, groundwater conservation district, county, regional water planning area, and river basin for use by groundwater conservation districts and for use in the regional water planning process.

I encourage open communication and coordination between groundwater conservation districts, regional water planning groups, and the TWDB to ensure that the modeled available groundwater reported in regional water plans and groundwater management plans are not in conflict. The estimates of modeled available groundwater are the pumping volumes that would have to occur to achieve the desired future conditions using the best available scientific tools. However, these estimates are based on assumptions of the magnitude and distribution of projected pumping in the aquifer. It is, therefore, important for groundwater conservation districts to monitor whether their management of pumping is achieving their desired future conditions. I encourage districts to continue to work with us to better define modeled available groundwater as additional information may help better assess responses of the aquifer to pumping and the distribution of pumping now and in the future.

August 22, 2018

Mr. Jim Polonis
Sutton County Underground Water Conservation District
301 S. Crockett Ave.
Sonora, TX 76950

Dear Mr. Polonis:

Texas Water Code, Section 36.1084, Subsection (b) states that the Texas Water Development Board's (TWDB) Executive Administrator shall provide each groundwater conservation district and regional water planning group located wholly or partly in the groundwater management area with the modeled available groundwater in the management area based upon the desired future conditions adopted by the districts. This letter and the attached report (GAM Run 16-026 MAG) are in response to this directive.

District representatives in Groundwater Management Area 7 adopted desired future conditions for the Dockum, Ellenburger-San Saba, Hickory, Ogallala, and Rustler aquifers on September 22, 2016 and the Capitan Reef Complex Aquifer on March 23, 2017 and adopted revised desired future conditions for the Edwards-Trinity (Plateau), Pecos Valley, and Trinity aquifers on March 22, 2018. The TWDB received the desired future condition explanatory reports and related materials from the Groundwater Management Area 7 consultant, Dr. William R. Hutchison, on November 28, 2016 and March 28, 2018.

Texas Water Code, Section 36.001, Subsection (25) defines modeled available groundwater as "the amount of water that the executive administrator determines may be produced on an average annual basis to achieve a desired future condition established under Section 36.108." We report modeled available groundwater estimates by aquifer, groundwater conservation district, county, regional water planning area, and river basin for use by groundwater conservation districts and for use in the regional water planning process.

I encourage open communication and coordination between groundwater conservation districts, regional water planning groups, and the TWDB to ensure that the modeled available groundwater reported in regional water plans and groundwater management plans are not in conflict. The estimates of modeled available groundwater are the pumping volumes that would have to occur to achieve the desired future conditions using the best available scientific tools. However, these estimates are based on assumptions of the magnitude and distribution of projected pumping in the aquifer. It is, therefore, important for groundwater conservation districts to monitor whether their management of pumping is achieving their desired future conditions. I encourage districts to continue to work with us to better define modeled available groundwater as additional information may help better assess responses of the aquifer to pumping and the distribution of pumping now and in the future.

Our Mission

To provide leadership, information, education, and support for planning, financial assistance, and outreach for the conservation and responsible development of water for Texas

District representatives in Groundwater Management Area 7 adopted desired future conditions for the Dockum, Ellenburger-San Saba, Hickory, Ogallala, and Rustler aquifers on September 22, 2016 and the Capitan Reef Complex Aquifer on March 23, 2017 and adopted revised desired future conditions for the Edwards-Trinity (Plateau), Pecos Valley, and Trinity aquifers on March 22, 2018. The TWDB received the desired future condition explanatory reports and related materials from the Groundwater Management Area 7 consultant, Dr. William R. Hutchison, on November 28, 2016 and March 28, 2018.

Texas Water Code, Section 36.001, Subsection (25) defines modeled available groundwater as "the amount of water that the executive administrator determines may be produced on an average annual basis to achieve a desired future condition established under Section 36.108." We report modeled available groundwater estimates by aquifer, groundwater conservation district, county, regional water planning area, and river basin for use by groundwater conservation districts and for use in the regional water planning process.

I encourage open communication and coordination between groundwater conservation districts, regional water planning groups, and the TWDB to ensure that the modeled available groundwater reported in regional water plans and groundwater management plans are not in conflict. The estimates of modeled available groundwater are the pumping volumes that would have to occur to achieve the desired future conditions using the best available scientific tools. However, these estimates are based on assumptions of the magnitude and distribution of projected pumping in the aquifer. It is, therefore, important for groundwater conservation districts to monitor whether their management of pumping is achieving their desired future conditions. I encourage districts to continue to work with us to better define modeled available groundwater as additional information may help better assess responses of the aquifer to pumping and the distribution of pumping now and in the future.

Our Mission : **Board Members**

To provide leadership, information, education, and support for planning, financial assistance, and outreach for the conservation and responsible development of water for Texas : Peter M. Lake, Chairman | Kathleen Jackson, Board Member | Brooke T. Paup, Board Member

This letter and the attached report (GAM Run 16-026 MAG) are in response to this directive.

District representatives in Groundwater Management Area 7 adopted desired future conditions for the Dockum, Ellenburger-San Saba, Hickory, Ogallala, and Rustler aquifers on September 22, 2016 and the Capitan Reef Complex Aquifer on March 23, 2017 and adopted revised desired future conditions for the Edwards-Trinity (Plateau), Pecos Valley, and Trinity aquifers on March 22, 2018. The TWDB received the desired future condition explanatory reports and related materials from the Groundwater Management Area 7 consultant, Dr. William R. Hutchison, on November 28, 2016 and March 28, 2018.

Texas Water Code, Section 36.001, Subsection (25) defines modeled available groundwater as “the amount of water that the executive administrator determines may be produced on an average annual basis to achieve a desired future condition established under Section 36.108.” We report modeled available groundwater estimates by aquifer, groundwater conservation district, county, regional water planning area, and river basin for use by groundwater conservation districts and for use in the regional water planning process.

I encourage open communication and coordination between groundwater conservation districts, regional water planning groups, and the TWDB to ensure that the modeled available groundwater reported in regional water plans and groundwater management plans are not in conflict. The estimates of modeled available groundwater are the pumping volumes that would have to occur to achieve the desired future conditions using the best available scientific tools. However, these estimates are based on assumptions of the magnitude and distribution of projected pumping in the aquifer. It is, therefore, important for groundwater conservation districts to monitor whether their management of pumping is achieving their desired future conditions. I encourage districts to continue to work with us to better define modeled available groundwater as additional information may help better assess responses of the aquifer to pumping and the distribution of pumping now and in the future.

Please contact Mr. Larry French of our Groundwater staff at 512-463-5067 or larry.french@twdb.texas.gov if you have any questions or need any further information.

Respectfully,

Our Mission

To provide leadership, information, education, and support for planning, financial assistance, and outreach for the conservation and responsible development of water for Texas

Dear :

Texas Water Code, Section 36.1084, Subsection (b) states that the Texas Water Development Board’s (TWDB) Executive Administrator shall provide each groundwater conservation district and regional water planning group located wholly or partly in the groundwater management area with the modeled available groundwater in the management area based upon the desired future conditions adopted by the districts. This letter and the attached report (GAM Run 16-026 MAG) are in response to this directive.

District representatives in Groundwater Management Area 7 adopted desired future conditions for the Dockum, Ellenburger-San Saba, Hickory, Ogallala, and Rustler aquifers on September 22, 2016 and the Capitan Reef Complex Aquifer on March 23, 2017 and adopted revised desired future conditions for the Edwards-Trinity (Plateau), Pecos Valley, and Trinity aquifers on March 22, 2018. The TWDB received the desired future condition explanatory reports and related materials from the Groundwater Management Area 7 consultant, Dr. William R. Hutchison, on November 28, 2016 and March 28, 2018.

Texas Water Code, Section 36.001, Subsection (25) defines modeled available groundwater as “the amount of water that the executive administrator determines may be produced on an average annual basis to achieve a desired future condition established under Section 36.108.” We report modeled available groundwater estimates by aquifer, groundwater conservation district, county, regional water planning area, and river basin for use by groundwater conservation districts and for use in the regional water planning process.

I encourage open communication and coordination between groundwater conservation districts, regional water planning groups, and the TWDB to ensure that the modeled available groundwater reported in regional water plans and groundwater management plans are not in conflict. The estimates of modeled available groundwater are the pumping volumes that would have to occur to achieve the desired future conditions using the best available scientific tools. However, these estimates are based on assumptions of the magnitude and distribution of projected pumping in the aquifer. It is, therefore, important for groundwater conservation districts to monitor whether their management of pumping is achieving their desired future conditions. I encourage districts to continue to work with us to better define modeled available groundwater as additional information may help better assess responses of the aquifer to pumping and the distribution of pumping now and in the future.

Please contact Mr. Larry French of our Groundwater staff at 512-463-5067 or larry.french@twdb.texas.gov if you have any questions or need any further information.

Respectfully,

Our Mission
