North Central Texas Council of Government’s
June 18, 2019

Unless specifically noted, this presentation does not necessarily reflect official Board positions or decisions.
Mission: “To provide leadership, information, education, and support for planning, financial assistance, and outreach for the conservation and responsible development of water for Texas”
Our goal is to
• research,
• develop, and
• disseminate information to advance and promote the development and use of alternative water supplies in Texas.
16 Regional Water Planning Areas

- Bottom up approach
- State Water Plan every five years
- Working on 2022 State Water Plan

Water Planning Basics

- Project population
- Project water demands
- Water availability (by source)
- Existing water supplies (by entity)

**Compare to identify surpluses or needs**

**Identify, evaluate, and recommend**
water management strategies and projects
Recommended Water Management Strategies by 2070 in the 2017 State Water Plan

In total, ~13% of new water supplies, which is ~1.1 million acre-feet/year

Irrigation conservation 15.7%

New major reservoir 13.0%

Municipal conservation 9.6%

Direct potable reuse 1.0%

Groundwater desalination 1.3%

Seawater desalination 1.4%

Aquifer storage & recovery 1.8%

Other conservation 2.4%

Drought management 2.7%

Other direct reuse 4.4%

Groundwater wells & other 7.4%

Indirect reuse 7.6%

Other strategies 0.6%

Other surface water 30.5%

~87,000 acre-feet/year

~371,000 acre-feet/year

~649,000 acre-feet/year

~13% of new water supplies, which is ~1.1 million acre-feet/year

Reuse recommended water management strategies

- 15 regional water planning groups (except A)
  - Direct Potable Reuse
  - Other direct reuse
  - Indirect reuse
Water Reuse

Two types: Indirect and Direct Reuse
Types of potable reuse

**De facto Water Reuse:**
A drinking water supply that contains a significant fraction of treated wastewater, typically from wastewater discharges, although the water supply has not been permitted as a water reuse project.

**Indirect Potable Reuse (IPR):**
The use of reclaimed water for potable purposes by discharging to a water supply source, such as a surface water or groundwater. The mixed reclaimed and natural waters then receive additional treatment at a water treatment plant before entering the drinking water distribution system.

**Direct Potable Reuse (DPR):**
The introduction of advanced-treated reclaimed water either directly into the potable water system or into the raw water supply entering a water treatment plant.

Raw Water Production Facility in Big Spring

Source: Eva Steinle-Darling, 2017 Water Reuse Conference
EXECUTIVE SUMMARY

In May 2013, the Colorado River Municipal Water District (CRMWD or District) began augmenting raw water supplies with advanced treated reclaimed water from its Raw Water Production Facility (RWPF) in Big Spring, Texas. Since the implementation of direct potable reuse projects at Big Spring and Wichita Falls, many view direct potable reuse (DPR) as a viable option for increasing a community’s water supply.

Study Goals

Because this newfound acceptance may lead to more DPR projects across the state, the Texas Water Development Board commissioned this study to increase confidence in the safety and effectiveness of the RWPF’s DPR applications through a detailed sampling campaign. In addition, this study includes guidance focused on indicators and surrogates for improved DPR process monitoring at a reasonable cost. Both of the aforementioned goals support further developing DPR projects as a viable water supply alternative across Texas and the United States.

Sample Results

Testing was conducted in accordance with a detailed Test Protocol, and data were compiled into summary tables and graphics. Samples collected unequivocally showed that the RWPF produces water of very high quality. In fact, the water is more than sufficient to serve as a raw water source that is blended with other, conventional raw water sources before being retailed in conventional water treatment plants served by the District. This conclusion is supported by a number of facts:

1. RWPF compliance testing already addresses parameters with regulatory limits. Based on the data provided to the project team (see Appendix C), no regulated parameters have been exceeded.

2. Study sampling for constituents of emerging concern (CECs) indicate that concentrations of CECs in the RWPF influent are below health-based benchmarks, and concentrations in the product water are correspondingly lower. In fact, unregulated CECs in the RWPF product water were generally lower than concentrations measured in samples from Moss Creek Lake. Water from Moss Creek Lake is blended with RWPF product water. This means that the RWPF product water is actually improving the quality of the blended water provided to downstream conventional water treatment plants for final drinking water treatment and distribution to customers.

3. Pathogen testing yielded equally clear results: Protozoa (Giardia and Cryptosporidium) and bacteria (Escherichia coli) were not detected past the first treatment process in the RWPF (residual filtration). Not a single sample collected at the RWPF tested positive for enteric virus.

Raw Water Production Facility in Big Spring
Potable Reuse Facilities in Texas

Direct potable reuse (purple symbol)
- Raw Water Production Facility in Big Spring
  - Operating since May 2013
- Direct Potable Reuse Project in Wichita Falls (emergency project)
  - Operating since July 2014
  - Decommissioned July 2015
- Advanced Purified Water Treatment in El Paso
  - Engineering design phase
- Direct potable reuse project in Brownwood
  - Canceled due to city council disapproval

Indirect potable reuse (blue star)
- Fred Hervey Reclamation Plant in El Paso
  - Operating since 1985
- Tarrant Regional Water District
- North Texas Municipal Water District
- City of Abilene
  - Operating since January 2015
- City of Wichita Falls
  - Operating since January 2017
