16 3-1/2 Minute Quadrangle

WELL NUMBERING SYSTEM
To facilitate the creation of water well supply and water well depletion or well numbers, a statewide water well numbering system has been adopted. A local water well numbering system based on the three-degree grid system in each county is used. Each county numbering system is based on a north-south or east-west grid pattern. The number assigned for each well is the grid number based on the three-degree grid system in each county.

The first digit(s) of the grid number identifies the three-degree grid system in each county. The second digit(s) of the grid number identifies the county grid, and the third digit(s) identifies the site number within the grid. The grid number is followed by the site number within the grid. The site number is followed by the month, day, and year of the survey or test. The survey or test indicates the type of survey or test done and the number of times the survey or test is done.

The grid number is followed by the site number within the grid. The site number is followed by the month, day, and year of the survey or test. The survey or test indicates the type of survey or test done and the number of times the survey or test is done.
