**Subject:** Water for Texas 2007

Dear Mr. Roberts:

My answer to the water problem is; 1. The U. S. Government should not subsidize the usage of any water from the underground water sources, for any reason. 2, When the lake levels are low as they are now, divide the lake with a dam at some narrow point and dredge the other side and save the water . This will enable use to store more water at less cost and lower the evaporation because there will be less exposure of the water to the sun.

Please do not e mail me a copy of this document, it will tie up my computer for days, but send me some information by mail so that I can get an idea of what is happening.

Thank you. Murvel Borth
