1.0 Executive Summary

Far West Texas contains three Texas Water Development Board (TWDB)-designated major aquifers and six minor aquifers. In addition, there are a number of areas within the Region that have no aquifer designation but in which groundwater is the primary source of supply. The purpose of this project is the establishment of additional aquifer characterization data upon which to base further groundwater availability analyses. The acquisition of additional aquifer characterization data will benefit the Far West Texas Water Planning Group in better defining available water supplies in the region, and will also support groundwater conservation districts in their responsibility of managing supplies and evaluating future desired conditions.

New hydrologic data in the form of static water level and well yields is tabulated from driller's reports on wells that have been drilled in recent years in Brewster, Culberson, Jeff Davis, and Presidio Counties. Where possible, as in Jeff Davis and Presidio Counties, well identification is coordinated between groundwater conservation district tracking numbers and Texas Department of Licensing and Regulation tracking numbers. A limited number of new wells and updated existing well data in eastern Hudspeth County was field measured and observed.

Water samples were collected from 22 wells and springs using recognized standard procedures and the samples were analyzed for basic inorganic constituents. All analyses indicate excellent quality water with total dissolved solids ranging from 87 to 545 milligrams per liter (mg/l). Four aquifer pumping tests were conducted during this project with transmissivities ranging from 190 to 198,570 (gpd/ft) and an additional four pumping tests are included that have been performed in the area but are not noted in the TWDB groundwater files.

2.0 Introduction

Far West Texas contains three TWDB-designated major aquifers and six minor aquifers. In addition, there are a number of areas within the Region that have no aquifer designation but in which groundwater is the primary source of supply. There is currently a deficiency of hydrologic data on file to support groundwater supply availability analysis for much of the more rural portions of both the designated and non-designated aquifer areas. Due to the overwhelming reliance on groundwater, the Far West Texas Water Planning Group strongly feels that it is imperative that aquifer availability analyses be significantly improved such that they can have more confidence in strategy recommendations involving groundwater resources.

The purpose of this project is the establishment of an additional amount and distribution of aquifer characterization data upon which to base further groundwater availability analyses. The acquisition of additional aquifer characterization data will benefit the Far West Texas Water Planning Group in better defining available water supplies in the region, and will also support groundwater conservation districts in their responsibility of managing supplies and evaluating future desired conditions.

The preliminary task in this project was to review the existing distribution of well data in the TWDB groundwater database and determine areas that are deficient in well data coverage, with emphasis in areas of current or future groundwater availability modeling efforts. In pursuing this task, no additional data was identified in the Rustler Aquifer as only a small part of this aquifer lies within this Region. Likewise, no additional data of significance was identified in the West Texas Bolsons Aquifer that would result in improvements to the recently completed West Texas Bolsons Aquifer Groundwater Availability Model.

While the interest of this data acquisition project centered on the rural counties of Far West Texas, the desire to not overlap coexisting and impending projects allowed the focus to be narrowed to more specific rural areas. TWDB staff were contemporaneously collecting field data from wells completed in the Capitan Reef Aquifer in Culberson and Hudspeth Counties. By verbal coordination with TWDB field staff, we did not attempt to gather data for this aquifer other than recent driller's reports. We did offer to conduct pumping tests on Capitan Reef wells if the TWDB staff identified appropriate wells to test; however, no wells were identified. The Marathon Aquifer in Brewster County and the Edwards-Trinity (Plateau) Aquifer in Terrell

County are slated for more detailed attention in 2009 during the next round of regional water planning; therefore, these areas were not considered for pumping tests.

Based on the results of the preliminary task of identifying areas of well data distribution needs, we recommended to the Planning Group that we concentrate our efforts on areas of significant pumpage as these are the areas that are of the greatest importance in groundwater modeling exercises. The Planning Group agreed and we proceeded to complete the data acquisition and pumping tests. New water wells reported by water well drillers were surveyed, positioned on maps, and data filed in tables in Brewster, Culberson, Jeff Davis, and Presidio Counties. Aquifers that were covered in this survey included the Igneous, Edwards-Trinity (Plateau), Capitan, Rustler, West Texas Bolsons, and other undocumented aquifers. Water quality samples were collected and analyzed, and pumping test were performed on Igneous Aquifer wells in Brewster, Jeff Davis, and Presidio Counties.

Activities involved in this project were coordinated with Sul Ross State University and groundwater conservation district managers. Sul Ross State University is a member of the Texas State University System, which is currently participating in the US Department of Agriculture's "Sustainable Agricultural Water Conservation in the Rio Grande Basin" research project. Specifically, Sul Ross staff participated in this project by assisting in the selection of pumping test sites, providing measuring equipment, and assisting with the actual testing process in the field. Groundwater conservation district managers in Brewster, Culberson, Jeff Davis and Presidio Counties participated in the project by sharing well records and assisting with gaining landowner permission to conduct pumping tests and collect water samples. The Jeff Davis UWCD is the only district with data not on file with the state (see Table A.3).

3.0 Groundwater Data Acquisition

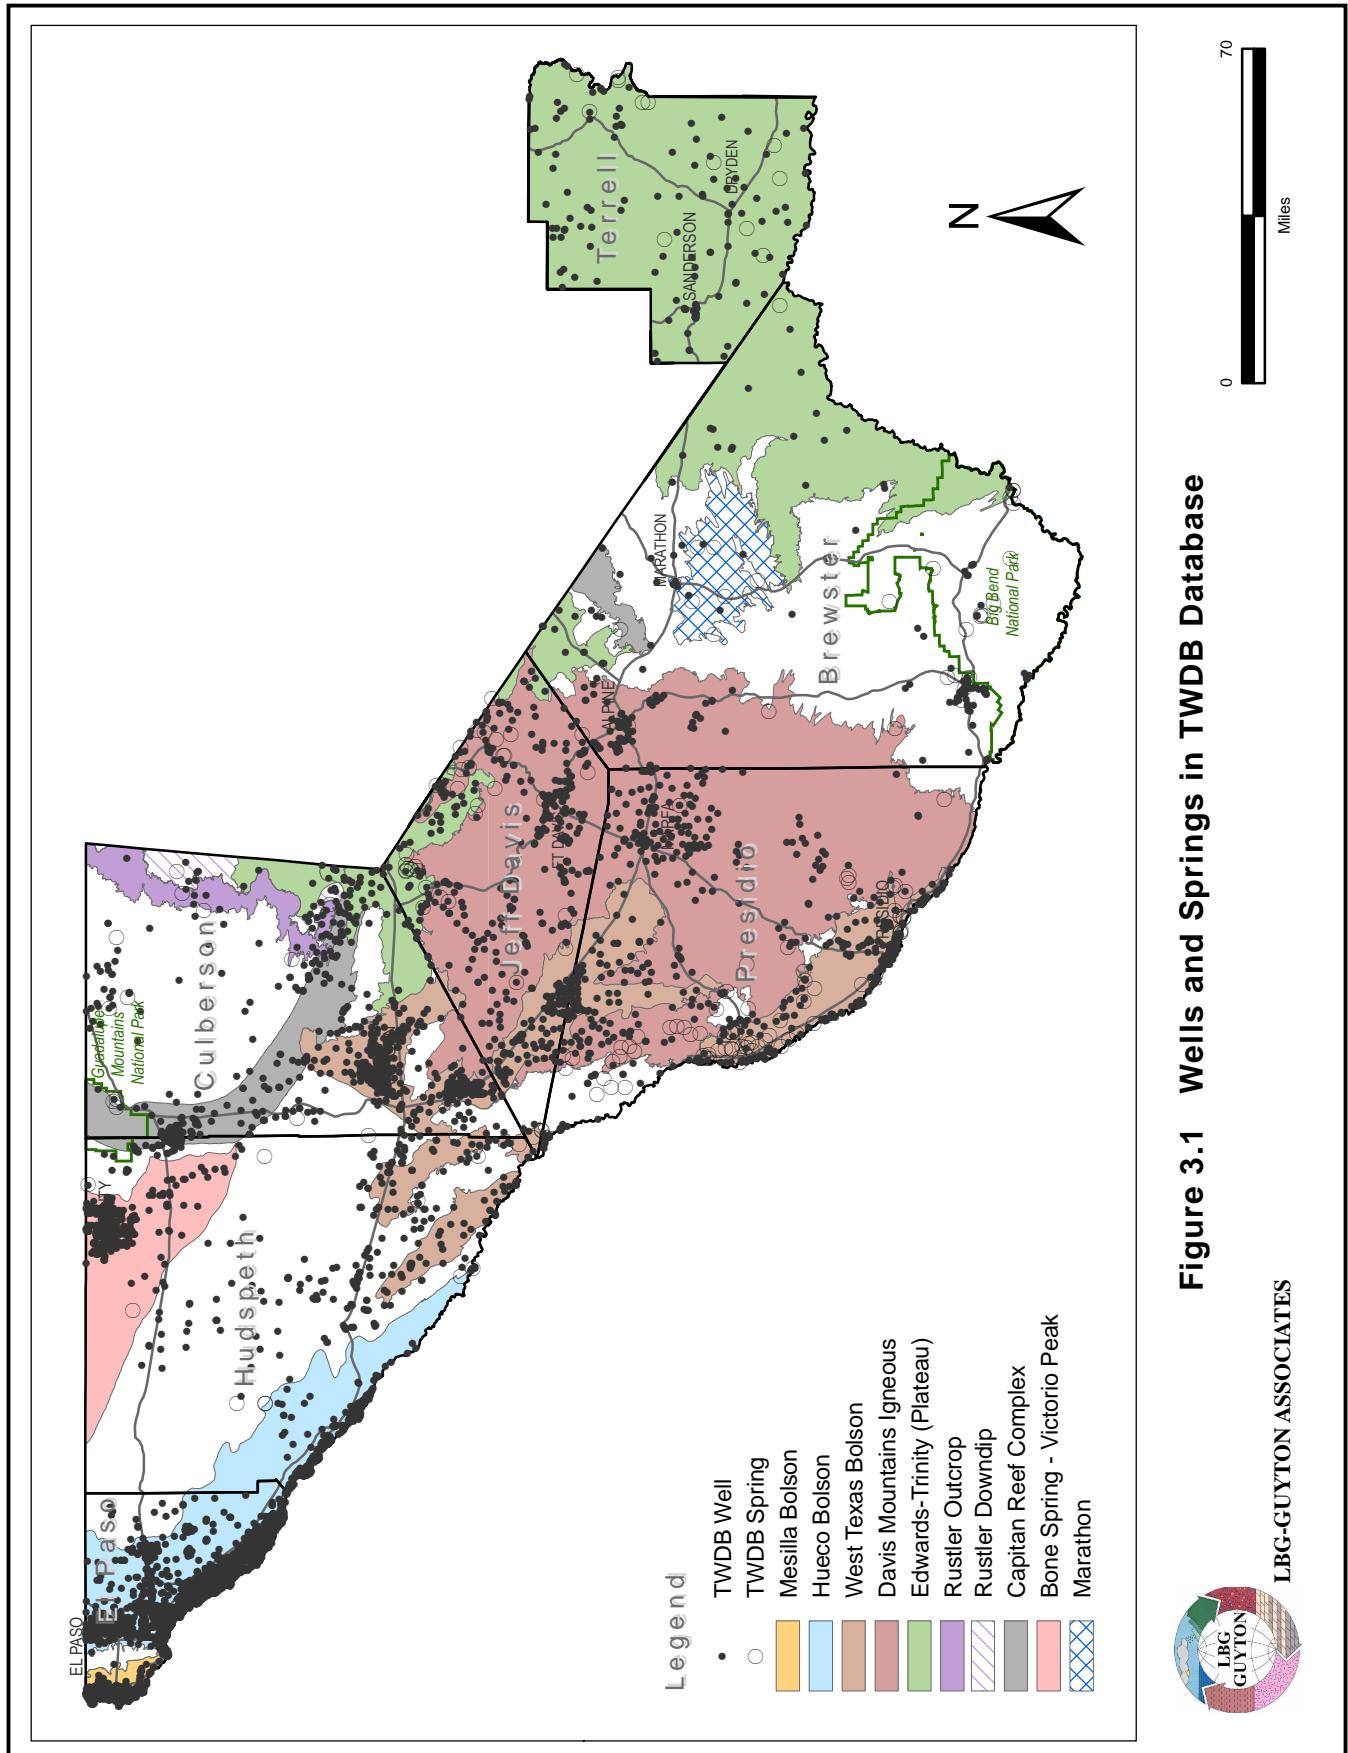

3.1 Well Data

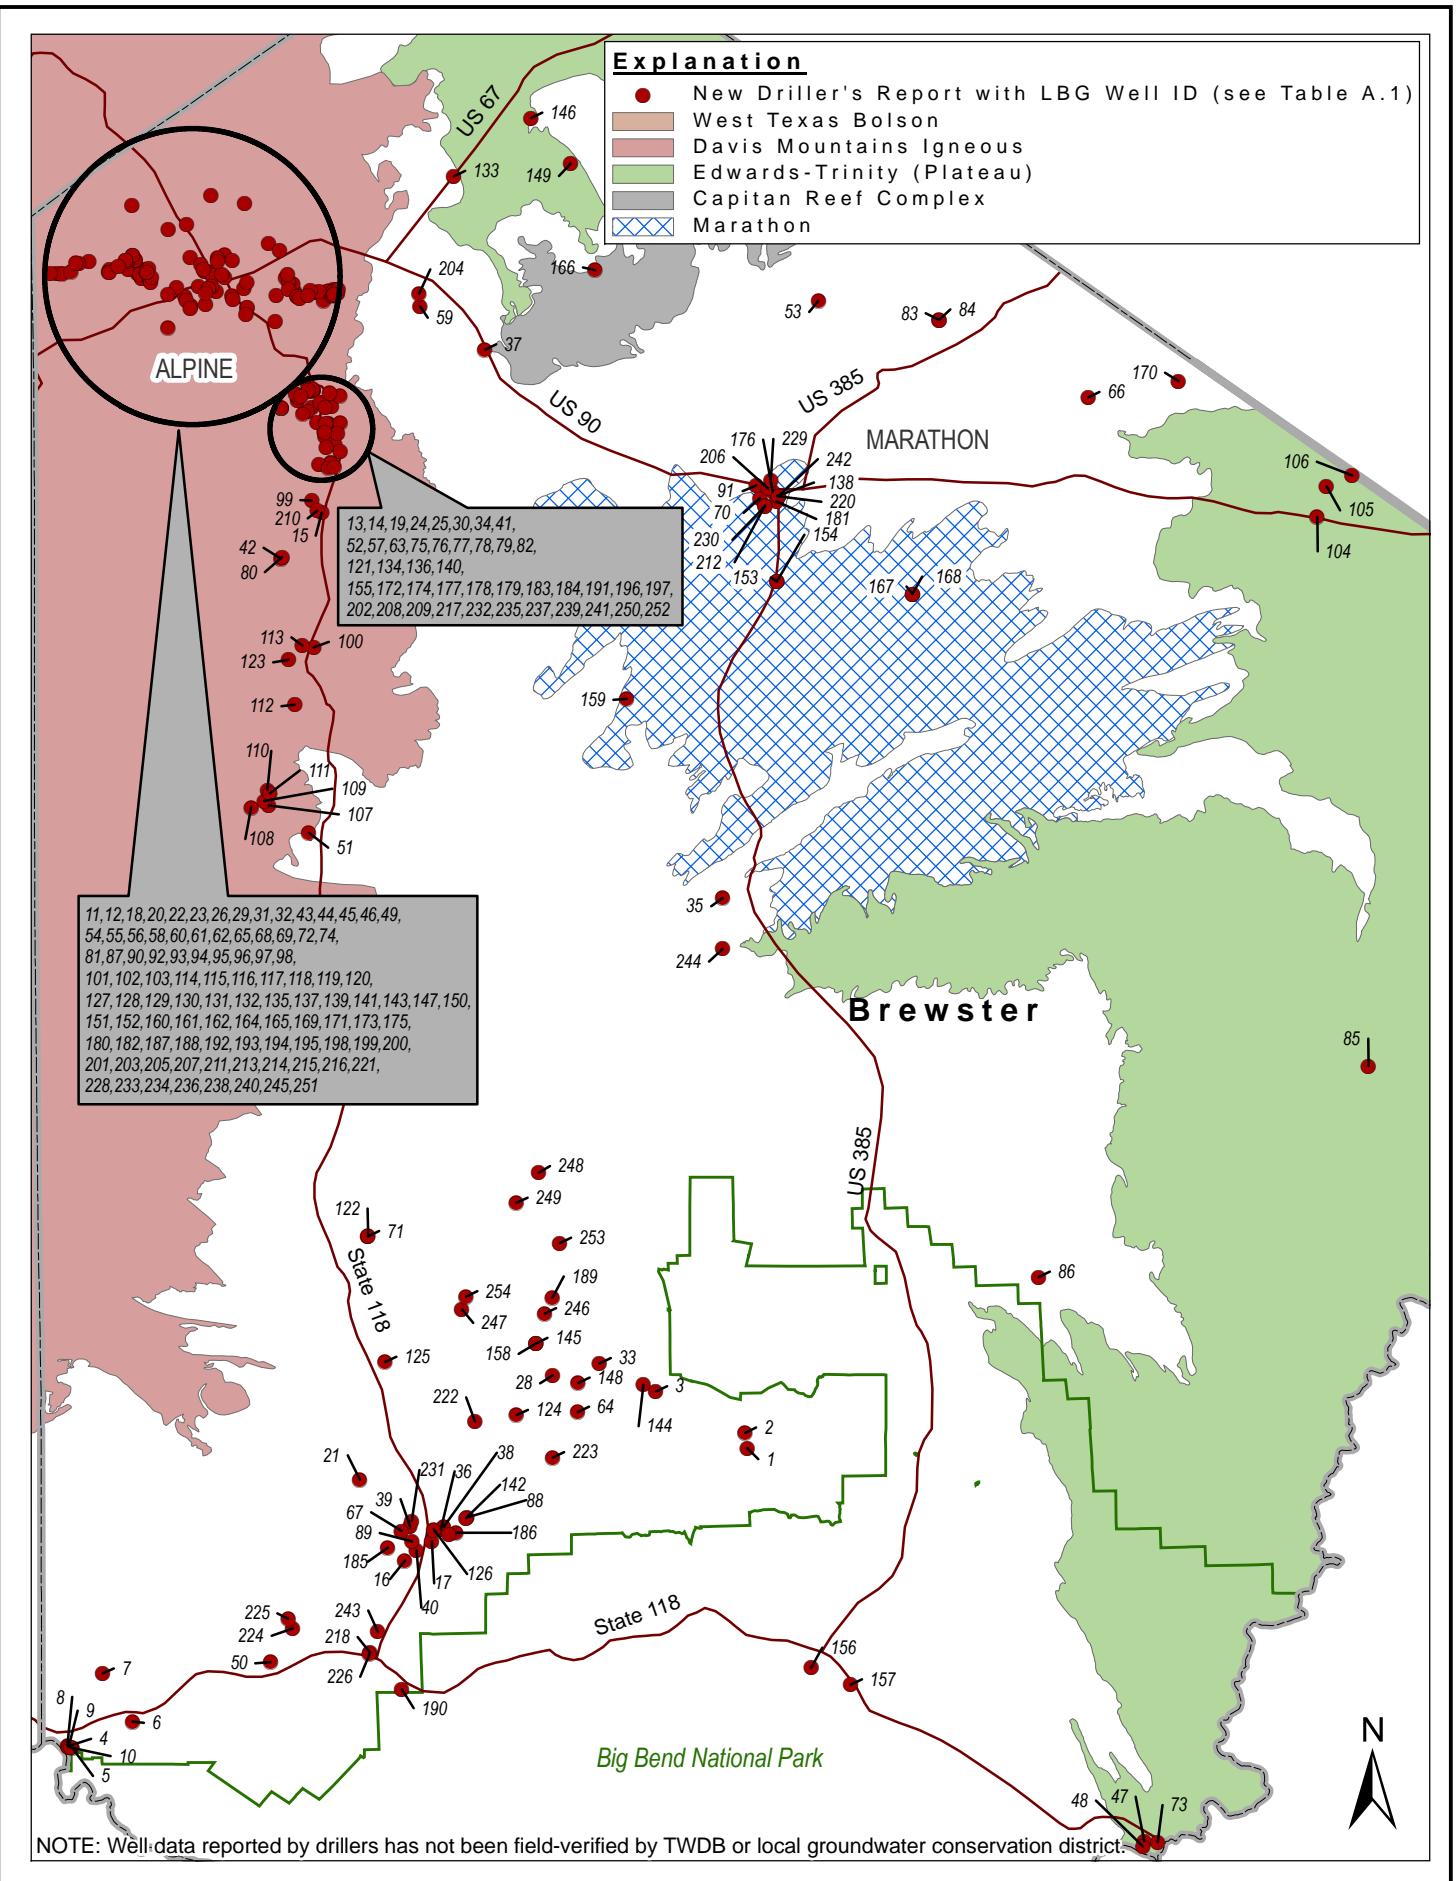

A significant number of wells are currently documented in the TWDB groundwater database (Figure 3.1). New hydrologic data not in the TWDB database in the form of static water levels and well yields are tabulated from driller's reports on wells that have been drilled in recent years in Brewster, Culberson, Jeff Davis, and Presidio Counties. Locations of these new wells are shown in Figures 3.2 through 3.5 and tables listing the wells are provided in Appendix A (Tables A.1 – A.5). Where possible, as in Jeff Davis and Presidio Counties, well identification is coordinated between groundwater conservation district identification numbers and Texas Department of Licensing and Regulation tracking numbers. It should be noted that these wells have not been field surveyed and, therefore, latitude and longitude coordinates as provided by the reporting driller may be subject to error. A limited number of new wells and updated well data in eastern Hudspeth County was field measured and observed (Appendix A: Table A.5).

3.2 Water Quality

The TWDB maintains numerous water quality analyses in its groundwater database. Figure 3.6 shows the distribution of wells from which these water quality analyses were derived. For this project, water samples were collected from 22 wells and springs (Figure 3.7) using recognized standard collection procedures. The samples were sent to a reputable laboratory to be analyzed for basic inorganic constituents. A summary of these analyses is listed in Table 3.1. All analyses indicate excellent quality water with total dissolved solids ranging from 87 to 545 mg/l.

4.0 Aquifer Pumping Tests

When a well is pumped and water is withdrawn from an aquifer, water levels in the vicinity are drawn down to form an inverted cone with its apex located at the pumping well. This is referred to as a cone of depression. Groundwater flows from higher water levels to lower water levels and, therefore, in the case of a pumping well, toward the well or the center of the cone of depression. The shape and size of the cone is directly related to the aquifer's hydraulic parameters. Pumping tests are the accepted standard for evaluating this cone of depression, and thus determining an aquifer's capacity to produce water.

Areas of specific interest in conducting pumping tests were those in which the aquifer was undergoing the most pumping stress. Municipal well fields and irrigation projects were most characteristic of this condition. The technical selection of wells to be tested was based on the following requirements:

- A working pump in the pumping well.
- A method to discharge water away from the immediate vicinity of the well.
- A method of estimating the rate of discharge.
- An available entry port for access of measuring equipment.
- Agreement by the land/well owner to allow the continuous pumping to occur for a designated minimum time period.
- Agreement by the land/well owner that test results would be made publically available.
- And also important to the validity of the results of the test, that a separate observation well be available in which to monitor water level change at a specified distance from the pumping well.

As discussed in the Introduction section of this report, certain areas were not considered for testing because of the desire to not overlap existing or impending project areas. Thus the Capitan Reef, Marathon, and Edwards-Trinity (Terrell County) Aquifers were not considered for this round of testing.

Figure 4.1 shows wells contained in TWDB and TCEQ databases that provide various forms of well production characterization. In some cases the data may represent transmissivity

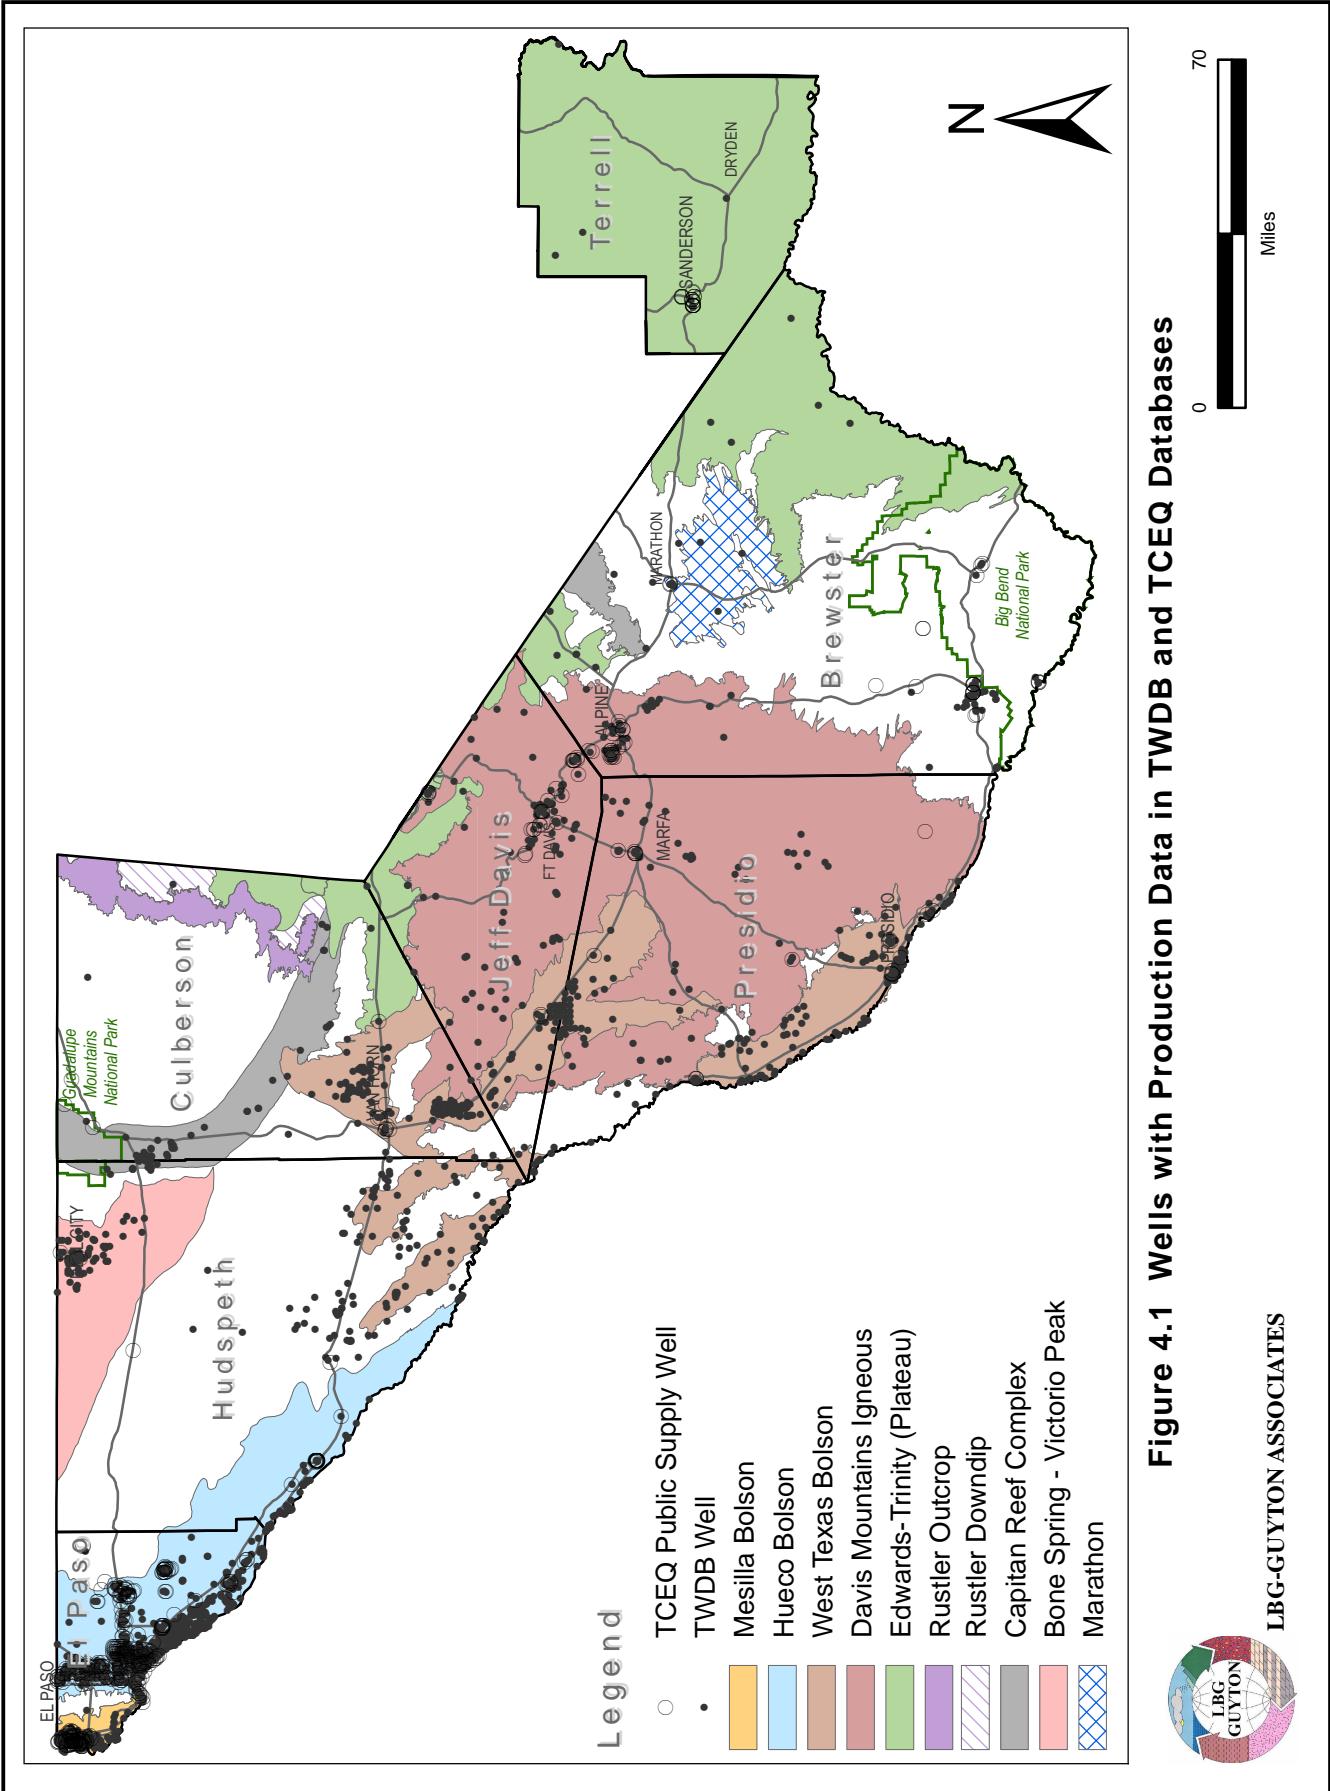

calculations from a complete pumping test, while others may contain simple well yield (gallons per minute) estimates by the water well driller or well yield and total water-level drawdown (specific capacity).

Figure 4.2 provides the location of wells in which current pumping tests were performed for this project, along with the location of other pumping tests that are not available in the TWDB groundwater database. Table 4.1 provides a list of wells used in both the current and previous pumping tests. Results of these pumping tests are provided in Appendix B and C.

Individuals that provided significant assistance in performing the pumping tests include:

- Ms. Janet Adams - Manager of the Jeff Davis County and Presidio County Underground Water Conservation Districts
- Dr. Kevin Urbanczyk - Sul Ross State University
- Ms. Cindy Hollander - Utility Department Manager, City of Alpine

5.0 Conclusions and Recommendations

The Texas Legislature, through the Texas Water Development Board, has designated 16 groundwater management areas (GMA), each of which incorporates all or significant portions of the major and minor aquifer systems in the state. The rural counties of Far West Texas are located within GMA 3, 4 and 7. Groundwater conservation districts (GCD) in each GMA are charged with developing the "desired future conditions" (DFC) of their respective aquifers. Based on these DFCs, the TWDB will develop "managed groundwater availability" (MGA) volumes for each aquifer, which each GCD must use in their water management permitting procedures. Regional Water Planning Groups will also be required to use these aquifer MGA volumes when assessing water supply management strategies in future plans.

A key factor in establishing the preliminary DFCs and the ultimate MGAs is knowing how much groundwater is being pumped from each aquifer and for what purpose. To estimate this quantity, it is essential to know the number and use of wells in each county. At the present time, the groundwater conservation districts in this Region are at different stages of developing an inventory of all wells in their respective districts. Although the water well driller's data included in this report is unconfirmed, it still provides a significant step forward in starting or continuing groundwater conservation district water well inventories.

To support the goal of securing better hydrogeologic characterization of the numerous aquifers in the Region, the Far West Texas Water Planning Group, with the assistance of the Texas Water Development Board, has continued a program of basic water well data acquisition. The goal of the current project was to produce information pertaining to: (1) the number and location of new wells that have been drilled in the past 10 years; (2) additional water quality analysis of samples of wells and springs that had not been previously sampled; and (3) pumping tests of several, mostly high-capacity wells. This project produced water well drillers data on more than 500 wells, water quality analyses from 22 wells and springs, and aquifer characterization information determined from eight pumping test centers.

The next step in the Far West Texas program of aquifer characterization is currently underway as pumping tests and well data inventories are being conducted in the Marathon Aquifer in Brewster County and the Edwards-Trinity (Plateau) Aquifer in Terrell County.

Hudspeh County Wells

NEW WELLS

Well Name	State Well Number	Latitude	Longitude	Year Drilled	Surface Elevation	Well Depth	Type Lift	Static Water Level (Ft BLS)	Water Level Date	Specific Conductance	SC Date	Remarks
New Graham House Well	48-24-2	31° 43' 638"	105° 03' 759"		3,670	200	Submersible			2,480	5/23/2003	Replacement for Graham well.
New Morrison Well	48-24-6	31° 40' 557"	105° 01' 885"		3,670	200	Submersible 1.5 hp	58.13	5/23/2003	3,170	5/23/2003	Replaces "Old Morrison" well. Pumping 16 gpm with no drawdown after 1 hour. Originally tested at 200 gpm. Caverns reported at 60 and 100 feet. Pumping 950 gpm, pumping water level 59.9 ft. after 25 hours.
Irrigation Well	48-24-6	31° 41' 157"	105° 01' 959"	2003	3,629	608	Turbin			3,880	5/23/2003	Solar powered. Water piped to James well tank.
Solar Well	47-17-2	31° 43' 411"	104° 57' 075"		3,635	90	Submersible (Pumping)	46.59	5/23/2003	4,410	5/23/2003	Pumping 3 gpm, tested at 20 gpm.

ADDITIONAL DATA FOR EXISTING WELLS

Well Name	State Well Number	Latitude	Longitude	Year Drilled	Surface Elevation	Well Depth	Type Lift	Static Water Level (Ft BLS)	Water Level Date	Specific Conductance	SC Date	Remarks
Black Mountain	48-23-901											Abandoned. Low capacity, quality ok for cattle.
Cottonwood	48-24-201											Abandoned. Former spring used by stage line.
Graham	48-24-202											Very salty.
Cavender	48-24-401											Abandoned. Unreliable supply.
Jim Hill	48-24-501											Abandoned. Low capacity, quality ok for cattle.
Bill Crane	48-24-502											Abandoned.
Old Morrison	48-24-601											Went dry when expanded irrigation began at Diablo Farms.
Pumpjack	48-24-901											Abandoned. Poor quality and little supply.
Flat Top	48-24-903											Abandoned. Poor quality and little supply.
Westley West	48-24-904											Sample taken from concrete tank.
James	47-17-101											Abandoned. Pure Oil Co. Grable #1.
Soda	47-17-217											Unused, dry well.
Little Babb	48-32-301											Abandoned.
Old Babb	48-32-601											Abandoned.
New Babb	48-32-602											Reported yield 32 gpm. Water reported encountered at 300 feet.
Wimberley	47-26-101											Reported good quality. Never pumps off.

Response to TWDB Comments

LBG-Guyton Associates

APPENDIX D-1
TWDB Contract No. 0704830690

TWDB Comments on Draft Final Phase 1 Special Studies Reports

Far West Texas (E) Region-Specific Studies

Study #1: Groundwater Data Acquisition/Compilation, & Aquifer Well Testing

General: Please submit all data and maps in an appropriate electronic format along with the final reports as stated in the contract between the Texas Water Development Board (TWDB) and Region E.

Response: All data and maps are prepared in an appropriate electronic format. Final report includes responses to TWDB comments.

1. All Report Figures: In the final report, please consider reviewing all figure formatting and changing, where appropriate, so that all details will be distinguishable in a Black & White format. (especially Figures 3.1–3.7 and 4.1–4.2)

Response: Well symbol designations are changed in Figures 3.1, 3.4 and 4.1 to distinguish well classifications. Background aquifer color is left as is to coincide with TWDB aquifer color scheme.

2. Please consider listing and identifying contents of appendices in the report's table of contents.

Response: Appendices are listed in the Table of Contents.

3. Contract Scope of Work (SOW) Deliverables: Please include in the final report a Conclusions/ Recommendations section to bring together the reasons for performing this study, the study's goals, and how the goals were achieved or not achieved, and summary discussion of recommendations for the next step(s) the Regional Water Planning Group should pursue in this process.

Response: Conclusions and Recommendations section is added to the report.

4. Contract SOW item 1 (and Deliverables methodology section): For a better comparison in the report figures and tables that show where data-deficient areas have been filled, where appropriate:

- a. Please only include TCEQ wells that have “usable” data available; and add detail to map figures to distinguish between TCEQ wells that have “usable” water levels and TCEQ wells that have “usable” water quality measurements.

[Please note that for this study “usable” data are defined as an individual TCEQ public water supply (PWS) well with measurements or an individual TCEQ PWS well where this study has obtained data samples before the groundwater is mixed or treated. Usable

- types of data include well location (including latitude/longitude), well depth, aquifer identification, field collection techniques, water level, and dissolved inorganic/trace metal constituents. See appropriate format at <http://www.twdb.state.tx.us/GwRD/HEMON/gwdatasub.asp>; and, TWDB Data Dictionary (UM-50) & Sampling Manual (UM-51) at <http://www.twdb.state.tx.us/publications/manuals/Manuals.asp> .]*
- b. Please add detail to individual county map figures to distinguish between “new” wells from the GCDs and wells that have submitted drillers’ reports available. [Please note that data from the drillers’ report database are questionable and are not “usable” by TWDB staff until actually visited & physically inventoried]

Response: 4a – TCEQ wells with production data is only shown in Figure 4.1 as a point of data availability reference. Usable new data is provided electronically to the TWDB in the appropriate TWDB format. Also see responses to comments 8, 10 and 13.

Response 4b – Figure 3.4 of Jeff Davis County is the only figure that distinguishes between new wells with state tracking numbers and wells identified by the GCD.

5. Contract SOW items 1b & 2b state that coordination would occur with Sul Ross State University and the TSU System to identify wells that have been tested or will be tested under their "Sustainable Agricultural Water Conservation in the Rio Grande Basin" (SAWCRGB) research project. Please document and discuss the results of these coordination efforts in the final report.

Response: Coordination discussion is provided in the fourth paragraph of Section 2.0.

6. Contract SOW items 1c & 2c state that coordination with groundwater conservation districts would occur. Please document and discuss the results of these coordination efforts and how they relate to the data presented in Tables A.1 - A.5 in the final report.

Response: Coordination discussion is provided in the fourth paragraph of Section 2.0 and in Section 3.1.

7. Contract SOW items 1d & 2d state that additional sources of well data & wells to be tested would be identified. In the final report, please document how this was accomplished and specify the types and sources of new data that are used in this study. Also, please document and discuss the results of this work, including maps where appropriate.

Response: The principal source of new well data is presented as driller's reports of wells drilled during the previous 10 years. Locations of these data are provided in Figures 3.2 through 3.5 along with a note on each figure stating that the data has not been field verified by the TWDB or GCDs. GCD managers assisted in the identifying new wells for sampling and testing. Locations of these wells are included in Figures 3.7 and 4.2.

8. Contract SOW item 1e states selected data would be prepared for inclusion in the TWDB Groundwater Database, including accurate well locations and aquifer designations. Please revise tables A.1 – A.5 in the appropriate format in the final report and in the appropriate electronic data format for inclusion in the database.

Response: Tables A.1 through A.5 are provided in the report in a format for ease of viewing by the lay reader of this report. Usable new data is provided electronically to the TWDB in the appropriate TWDB format.

9. Contract SOW items 1f & 2a state that TWDB staff would assist in the identification of wells for sampling, analysis, and modeling. Please document and discuss the results of this coordination and the methodology used to select the sites. In particular, please clarify the choice to cluster the sites within a relatively small area of the Davis Mountain Igneous Aquifer even though the SOW specifies that the study emphasis will be on the Rustler, Capitan Reef, and West Texas Bolsons aquifers.

Response: Coordination with TWDB staff and selection of testing locations is discussed in paragraph 3 of Section 2.0 and paragraph 3 of Section 4.0.

10. Contract SOW item 1f: Some of the sites with water quality analyses will require the assignment of TWDB state well identification numbers. To accomplish this task, please provide a table with types of data specified in comment #4 above. Also, please use the attached spreadsheet for appropriate water quality data entry for the 22 sites specified in this report and identify the lab that performed the analyses.

Response: Usable new data is provided electronically to the TWDB in the appropriate TWDB format.

11. Contract SOW item 1g notes the relationship that exists between the amount of groundwater available in a region and the establishment of desired future conditions by the groundwater management area. Please include a discussion of this item in the report.

Response: Groundwater availability in relationship to desired future conditions is discussed in Section 5.

12. Contract SOW item 2e: Please provide digital pdf files of the aquifer well-testing plots, along with enough record of the well information to assign state well numbers for the two sites currently lacking them (Emily Alexadia [sic] and Hillcrest Cemetery [sic]). Please include the scanned image files for the 8 additional pump tests in the submittal of the final report. Also, please make note as to whether or not any of these sites are available as observation wells for the future.

Response: PDF files of all test plots are provided. Well data for the two non-SWN wells is also provided to the TWDB in the appropriate format. The City of Alpine wells may be the most easily accessible for further monitoring. TWDB staff has measured water levels in some of these wells in the past. Monitoring of other private wells must be at the discretion of the landowners.

13. Contract SOW item 2f states transmissivity or storage coefficient will be calculated and provided in the appropriate format for the TWDB groundwater database. Please provide this data electronically in the appropriate format for inclusion in the groundwater database.

Response: Usable new data is provided electronically to the TWDB in the appropriate TWDB format.

APPENDIX D-2
TWDB Contract No. 0704830690

Subsequent TWDB Comments on Draft Final Phase 1 Special Studies Reports

Far West Texas (E) Region-Specific Studies

Study #1: Groundwater Data Acquisition/Compilation, & Aquifer Well Testing

Subsequent TWDB comment on response: Missing data files were received separately 9-9-09; please include this digital data on the new CD to be submitted.

Response: All data is included in final CD as requested.

9. Subsequent TWDB comment on response: Response inadequate; report did not address aquifers explicitly named in SOW and performed work on an aquifer not mentioned in SOW. Also, did not obtain RWPG or TWDB approval for these deviations. Please resubmit report with text discussing basis for not studying specified aquifers and changing study focus.

Response: Comment issues are addressed in a revised Introduction Section. The report is reprinted, resubmitted to Planning Group for approval, and resubmitted to the TWDB. \$10,447.70 was unused and is returned to the TWDB.
