Compilation Report

October 1965—September 1971

INTRODUCTION

This report covers the 1966 through 1971 water years, and is a supplement to Texas Water Development Board Reports 106 and 45, Texas Water Commission Bulletin 6410, and Texas Board of Water Engineers Bulletin 6108. These prior publications presented the results of suspended-sediment-load measurements at permanent observation points from the beginning of record through the 1965 water year. (A water year extends from October 1 through the following September 30, and is identified by the year in which it ends.) No reconnaissance type determinations of short-period record or intermittent record are compiled.

This report was prepared under the general direction of C. R. Baskin, Principal Engineer-Data and Technical Review and under special direction of E. W. Rowland, Director, Special Services Division. Assistance in checking tabulations in the report was provided by John P. Dougherty, Hydrography Branch Chief, Special Services Division and Glen W. Bishop, Engineering Technician, Hydrography Branch, Special Services Division. Computations of reservoir capacity-to-inflow ratios for the four reservoir sediment records included in this report were prepared by the author under the direction of H. M. Cook, Assistant Director, Special Services Division.

STATUS OF SUSPENDED-SEDIMENT
SAMPLING STATIONS

During the period covered by this report, the Texas Water Development Board operated 44 suspended-sediment sampling stations. The Board was assigned responsibilities for State activity in this field of surface-water investigations beginning September 1, 1965. Six stations were established and 5 were discontinued in the State program during this report period. A total of 39 stations are presently in operation.

COOPERATION

The following agencies cooperated with the Texas Water Development Board in the operation of, or furnished data for, suspended-sediment-sampling stations included in this report:

Lower Colorado River Authority, Austin;

Brazos River Authority, Waco;

City of Corpus Christi; and

U.S. Geological Survey, Water Resources Division, Austin.

EXPLANATION OF DATA

Suspended-sediment-sampling stations operated by the Texas Water Development Board at or near streamflow-measuring stations use streamflow records collected by the U.S. Geological Survey in the determination of estimated suspended-sediment loads. The identification number appearing with the station name is the standard U.S. Geological Survey number for that measurement station. Those suspended-sediment-sampling stations operated by the Texas Water Development Board at Possum Kingdom Reservoir and Lake Buchanan, where samples are collected from releases, use computed-release records furnished by the reservoir operator in the determination of estimated suspended-sediment loads.

Samples are collected in 8-ounce narrow-neck bottles at a position approximately 1 foot below the water surface near midstream. The percentage of suspended sediment by weight obtained from the sample is multiplied by the factor 1.102 to obtain the mean percentage of suspended sediment in the vertical profile.

Laboratory determinations were equated to the corresponding streamflow in determining the total suspended-sediment load.

The Texas Water Development Board uses 62.5 pounds as the average weight of 1 cubic foot of streamflow. Temperature and dissolved constituents affect the density of water. The average water weight selected is used for all calculations. The density of sediment used for all calculations is 70 pounds per cubic foot. It is emphasized that this implied density is an estimated average which may be expected for ultimate consolidation. Individual sediment deposits will have varying densities dependent on several factors. The assumptions of density may also be expressed as:

One acre-foot of streamflow = 1,361.25 tons, and

One acre-foot of sediment = 1,524.60 tons.

No attempt has been made to include in this report that sediment which may be moved by a flowing stream along its bottom, commonly referred to as "bed load."

Presented with the sediment data obtained for the 1966 through 1971 water years is a summary table showing maximum, minimum, and average annual suspended-sediment transport passing each gaging point for the total period in full water years.

Monthly values of sediment conversions to acre-feet are rounded to the nearest whole number and are based on a density of 70 pounds per cubic foot. Summary streamflow and sediment-load values for each year are totals of the monthly figures. Annual values of volume in acre-feet are determined from the total tonnage measured for the year rounded to the nearest whole number. Therefore, annual volumes do not always coincide with totals of the twelve monthly values each year.

Sediment outflow for four reservoirs in Texas were obtained during this report period. Records were taken at Possum Kingdom Reservoir, Brazos River Basin; Somerville Lake, Brazos River Basin; Lake Buchanan, Colorado River Basin; and Lake Corpus Christi, Nueces River Basin. Streamflow and sediment data are presented in three categories for the four reservoirs. First, a summary table showing ratios of reservoir capacity to reservoir inflow is presented as an indicator of reservoir trap efficiency for sediment retention. Second, a summary table and current data are given for suspended sediment passing through the reservoir. Third, suspended-sediment discharge with flood releases occurring within the six-year period covered by the current tabulation is presented to indicate that portion

of the annual total passing within these very brief flood periods.

OTHER SEDIMENT RECORDS

Records of suspended-sediment loads in Texas from sampling stations operated by the U.S. Geological Survey, and by the International Boundary and Water Commission—United States and Mexico, are collected in addition to those contained in this report. Daily and partial records obtained by the U.S. Geological Survey are reported annually in a publication titled "Water Resources Data for Texas, Part 2, Water Quality Records." Suspended-sediment records for the Rio Grande collected by the International Boundary and Water Commission are published annually in a bulletin titled "Flow of the Rio Grande and Related Data."

DEPTH-INTEGRATED SUSPENDED-SEDIMENT SAMPLING

Sampling, on a regular basis, for determining suspended sediment transported by Texas streams began in 1924. Techniques developed for sampling streamflow at the beginning of the program are still being used. Comparisons have shown that water samples collected from just below the surface of a stream contain slightly different concentrations of suspended material than water samples collected with a depth-integration sampling device. In 1968, a continuing study was undertaken by the Water Development Board to compare the results obtained with those two sampling methods. This study is being carried out to improve upon the numerical factor currently used to adjust concentrations of suspended sediment found in near-surface samples to the true average concentration existing throughout the cross-section of a stream.

While the two sampling methods give slightly different results for single samples, the average ratio of sediment concentrations for a large number of water samples collected by the two methods at the same stage of flow holds quite steady over long periods. Although the study is not considered complete, differences in concentration resulting from the two sampling methods appear to be greatest where fluvial sediment loads contain appreciable amounts of fine sand.

Preliminary findings are that there is good correlation between depth-integration suspended-sediment sampling and near-surface suspended-sediment sampling.

SABINE RIVER BASIN

8022500 SABINE RIVER AT LOGANSPORT

Net Drainage Area: 4,839 square miles.

Location: U.S. Highway 84 bridge at Logansport, Louisiana.
 Flow records are from stream-gaging station Sabine River at Logansport, Louisiana, located 4,600 feet upstream from sampling point.

Records Available: December 1932 to December 27, 1933;
 September 1935 through February 1968.
 Discontinued due to inundation by backwater of Toledo Bend Reservoir. Sampling subsequently was begun upstream at station Sabine River near Tatum.

BRAZOS RIVER BASIN
8088500 POSsum KINGDOM RESERVOIR NEAR GRAFORD

Net Drainage Area: 13,310 square miles.

Location: Samples taken in tailrace and over spillway. Outflow records were obtained from computed releases as determined by Brazos River Authority. Outflow records for period October 1953 through September 1959 are streamflow as gaged at Brazos River near Palo Pinto station below Possum Kingdom Reservoir. Inflow estimates were computed by adjusting Brazos River near South Bend streamflow between that gage and Morris Sheppard Dam.

Records Available: January 15, 1942 to date, except for October 1960.

- a/ Estimates of reservoir capacity were obtained by correlating adjusted suspended-sediment measurements taken at South Bend with depletion of reservoir capacity occurring between original capacity (May 1941) and deposition survey of February 1949. This correlation was then projected forward.
- b/ Average for the 28-year period.
- c/ Record for 1960 incomplete and not included.
- d/ Combined releases from turbines, floodgates, and spillway as computed by the Brazos River Authority. These flood discharges are included in the discharges shown for their respective water years.
- e/ No flood. Discharged to hold elevation down to permit installation of stainless steel channel in concrete rollway for future use in gate repair and maintenance.

BRAZOS RIVER BASIN

8093500 AQUILLA CREEK NEAR AQUILLA

Net Drainage Area: 306 square miles.

Location: Farm Road 1304 bridge, 1 mile southeast of Aquilla.
 Flow records are from stream-gaging station at
 same location.

Records Available: June 1963 to date.

BRAZOS RIVER BASIN
8109900 SOMERVILLE LAKE NEAR SOMERVILLE

Net Drainage Area: 1,008 square miles.

Location: State Highway 36 bridge about 1 mile downstream from Somerville Reservoir. Outflow records are from stream-gaging station Yegua Creek near Somerville at the same location.

Records Available: June 1962 to date. Record represents reservoir outflow begining February 3, 1966.

BRAZOS RIVER BASIN

SOMERVILLE LAKE NEAR SOMERVILLE--Continued

III. SEDIMENT DISCHARGE WITH FLOOD RELEASES IN 1967-71

Reservoir spills were not experienced during report period.

- a/ Estimates of reservoir capacity were determined from planned sediment retention used in reservoir design.
- b/ Reservoir inflow determined from net change in storage for water year, outflow, and estimated evaporation loss.
- c/ Average for the period 1967-71.

BRAZOS RIVER BASIN 10348

8110500 NAVASOTA RIVER NEAR EASTERLY TULAWAY

Net Drainage Area: 940 square miles.

Location: U.S. Highway 79 bridge, 7 miles northeast of Easterly. Flow records are from stream-gaging station at same location.

Records Available: January 1942 to date, except for missing periods, February through September 1954, April through August 1958, and June through August 1959.

- a/ Estimates of reservoir capacity from U.S. Bureau of Reclamation projections as presented in the report "The Lower Colorado River Authority" dated November 1960, Volume 1.
- b/ Inflow records were computed by combining released flows with daily reservoir content changes.
- c/ Average for the 24-year period.
- d/ Combined release through turbines, floodgates, and spillway as computed by the Lower Colorado River Authority. Flood discharges are included in the discharges shown for their respective water years.

COLORADO RIVER BASIN

8151500 LLANO RIVER AT LLANO

Net Drainage Area: 4,233 square miles.

Location: State Highway 16 bridge in downtown Llano. Flow records are from stream-gaging station Llano River at Llano, 0.4 mile downstream.

Records Available: August 1942 to date.

NUECES RIVER BASIN

8207000 Frio River at Calliham

Net Drainage Area: 5,491 square miles.

Location: Farm Road 99 bridge, 1 mile north of Calliham.
 Flow records are from stream-gaging Frio River
 at Calliham, about 2,500 feet upstream from
 sampling point.

Records Available: January 1953 to date.

NUECES RIVER BASIN

8210500 LAKE CORPUS CHRISTI NEAR MATHIS

Net Drainage Area: 16,656 square miles.

Location: Sediment outflow measured at State Highway 359 bridge about 0.6 mile downstream from Wesley E. Seale Dam.
 Flow records are from stream-gaging station Nueces River near Mathis, at the same location.

Records Available: February 2, 1942 through May 1958, and July 1961 to date.

- a/ Estimates of reservoir capacity are based on October 1972 sediment survey and were determined using sediment inflow values taken from an adjusted sediment production curve for stream-gaging station Nueces River at Three Rivers, less measured sediment outflow.
- b/ Average for the period 1959-71.
- c/ Sediment outflow during periods of flood discharge are included in the annual totals shown in Part II. These figures reflect that part of annual sediment outflow occurring within very brief flood periods.
