## **ABSTRACT**

Due to higher energy costs, declining well yields, unavailability of labor and depressed farm prices, less acreage was irrigated and less water applied in 1989 than in prior surveys. Irrigation in Texas in 1989 was 6.1 million acres with a total of 8.8 million acre-feet of on-farm use of water. This is a decrease of 675 thousand acres and 548 thousand acre-feet from the 1984 survey. "Surveys of Irrigation in Texas, 1958, 1964, 1969, 1974, 1979, 1984, and 1989" is based on cooperative surveys by the Texas Water Development Board, the U.S. Department of Agriculture's Soil Conservation Service, and the Texas State Soil and Water Conservation Board. Information provided includes irrigated acreage and crops, water use, sprinkler irrigation acreages, irrigation operations, and irrigation conservation practices. Irrigation acreage and water use are summarized by counties, river and coastal basins, soil and water conservation districts, and 11 principal irrigation regions of the State.

In much of Texas, irrigation water prevalently is applied in climatic provinces where natural rainfall may contribute significantly to the soil moisture condition. Irrigation, thusly practiced, eliminates the risk of recurring low rainfall periods and improves the seasonal moisture supply for crop-growing efficiency. The amounts of water consequently used for irrigation fluctuates from year to year with changes in climatic conditions and the amount of acres irrigated. During the survey period, on-farm water use for irrigation jumped, along with irrigated acres, from 9.6 million acre-feet on 6.7 million acres in 1958 to 12.5 million acre-feet on 7.7 million acres, in the dry year 1964. Irrigation water use then declined to 11.6 million acre-feet used on an expanding 8.2 million acres in 1969, a relatively wet year, then increased to 13.1 million acre-feet on 8.6 million acres in 1974, then declined to 9.7 million acre-feet on 7.8 million acres in 1979, declined again to 9.3 million acre-feet on 6.7 million acres in 1984, and continued to decline to 8.8 million acre-feet on 6.1 million acres in 1989.

Leading irrigated crops in 1989 were cotton - 1,797,000 acres; wheat - 970,000 acres; grain sorghum - 844,000 acres; and corn - 806,000 acres.

Irrigation wells continue to hold steady in number, even though some of the older wells have been abandoned. There were 55,000 irrigation wells in Texas in 1958; 70,000 in 1964; 83,000 in 1969; 90,000 in 1974; 95,000 in 1979; 100,000 in 1984; and 100,000 in 1989. In the 1989 survey, ground water from these wells constitutes 71 percent of the total on-farm water use for irrigation in the State, while 29 percent is supplied from surface water.

Water conservation measures are being practiced by Texas irrigators to "stretch" and conserve their precious water supply. In many areas, water losses due to seepage and evaporation are being reduced by adding concrete linings to the delivery ditches or replacing ditches with underground pipeline. Surveys of water conveyance methods in 1989 showed there were 1,200 miles of concrete-lined ditches serving 155,000 acres and 22,000 miles of underground pipeline serving 4.9 million acres. These conservation measures have thus been applied to 82 percent of Texas irrigated land in 1989. New methods of applying water to crops also hold promise for water savings. Included among the newer methods being applied in Texas is trickle irrigation, by which a slow, continuous or nearly continuous flow

of water is delivered to the root zone of each plant from plastic tubing. Trickle irrigation was used on 40,900 acres in 1989 compared to 29,900 acres in 1984, 19,800 acres in 1979, and 4,000 acres in 1974. Leading trickle irrigated crops in 1989 were pecans - 26,750 acres; grapes - 4,500 acres; and citrus - 3,500 acres.

## **ACKNOWLEDGEMENTS**

Each of the seven irrigation surveys was made cooperatively by the Soil Conservation Service of the United States Department of Agriculture, the Texas State Soil and Water Conservation Board, and the Texas Water Development Board. Results of 1958, 1964, 1969, 1974, 1979, and 1984 surveys have been published previously. To facilitate comparisons, this report includes some of the basic data from the previous reports as well as data from the new 1989 Irrigation Survey.

The preparation of maps showing location of irrigated land and the compilation of acreages of irrigated crops, amounts of water used, and other survey data was accomplished by the Soil Conservation Service in its various field offices, by district conservationists and technicians under general direction of the area conservationists and area engineers. These activities in the 1989 Irrigation Survey were directed by Civil Engineers - Field Specialists, James Hailey, L. Dennis Medlin, Tom Gray, and coordinated by Water Management Engineer (Irrigation) Eugene Lindemann under the general guidance of State Conservation Engineer Cecil Currin and State Conservationist Harry Oneth. Messrs. Hailey, Medlin, Gray, and Lindemann conducted the training meetings of Soil Conservation Service area engineers who gave leadership to the work done by area and field office personnel. Mr. Charles Baird, Water Management Engineer, coordinated the review of the completed data following the field office data collection activities.

The Texas State Soil and Water Conservation Board, under the supervision of Robert Buckley, Executive Director, assisted in developing procedures for making the 1989 Irrigation Survey, and provided soil and water conservation district boundary delineations for the county maps used in making the survey. These delineations made possible the compositing of survey data for each soil and water conservation district.

The State Department of Highways and Public Transportation provided county maps, which were used as base maps for recording irrigation survey data.

Within the Texas Water Development Board, the Agriculture Conservation Unit guided the planning, development of procedures, and scheduling of the 1989 Irrigation Survey; assisted the Soil Conservation Service staff in giving training to the area engineers; and prepared the survey data for computer processing. Tom Martin, Atlan Pfluger, Terrell Robison, Comer Tuck, and Jeff Walker of the Agricultural Conservation Unit worked on these activities and prepared the final report with other staff assistance. Other Board staff supported the 1989 Survey and this report with assistance in typing, drafting, and publication activities.

## **IRRIGATION DEVELOPMENT IN TEXAS**

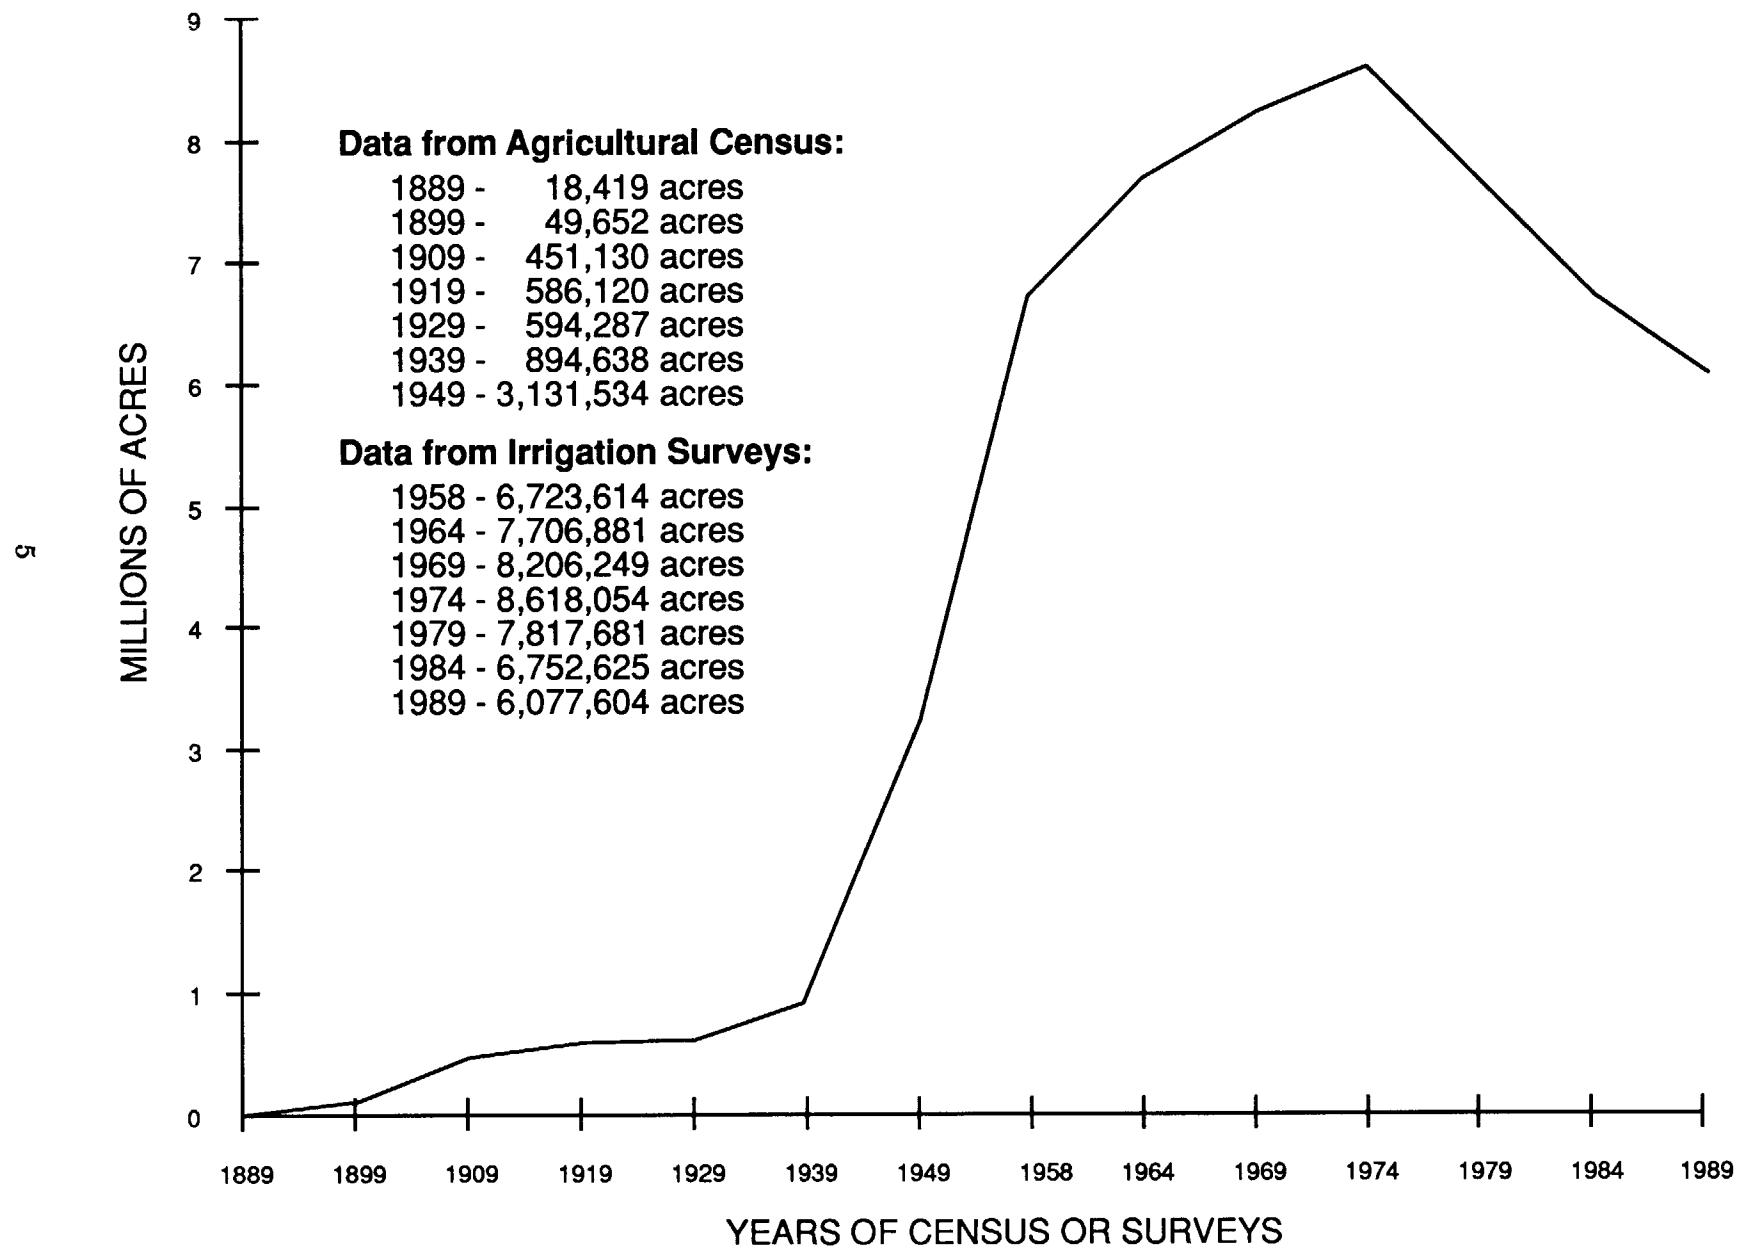

The census for the crop year of 1889 reported that Texas had over 18,000 acres irrigated on 623 farms. By 1899, the area irrigated approached 50,000 acres on 1,325 farms. Comparatively rapid development occurred during the period 1900-09. The area irrigated in 1909 was about 451,000 acres.

Development was much slower from 1910 to 1929 when about 594,000 acres was irrigated. Irrigated acreage increased by about 300,000 acres during the next 10 years. The census of 1939 reported that Texas had nearly 895,000 acres irrigated. Particularly rapid irrigation development followed the end of World War II. The 1949 Census of Agriculture reported 3.1 million acres irrigated, and the 1958 Irrigation Survey showed 6.7 million acres irrigated. Subsequent surveys reported 7.7 million acres in 1964; 8.2 million acres in 1969; 8.6 million acres in 1974; 7.8 million acres in 1979; and 6.7 million acres in 1984. By 1989, the area irrigated in the State was 6.1 million acres, as was indicated in the 1989 Irrigation Survey (Figure 1, Texas Irrigation Development, 1889-1989).

The history of irrigation in Texas has recorded some failures because of inadequate water supply, poor water quality, poor soil conditions, inadequate irrigation systems, or inefficient water management. On the other hand, successful irrigation enterprises have been developed in every area of the State, including the eastern-humid areas.

Maintaining water conditions in the soil favorable to plant growth continues to be an especially important requirement in the arid and semi-arid parts of the State where the rainfall is variable as to amounts and seasons of occurrences, and where most crop plants cannot be grown without irrigation water or where the risk without irrigation water is great.

Figure 1.  
TEXAS IRRIGATION DEVELOPMENT 1889-1989

## **DEVELOPMENT OF SURVEYS**

Data on irrigated lands have been inadequate and irrigation water-use data, which are necessary to assess and project agricultural water use and needs accurately, have not been generally available. For other forms of water use, data are generally collected annually and are more readily available.

Cooperative arrangements were made in 1958 with the Soil Conservation Service of the United States Department of Agriculture to survey Texas irrigation. After this first survey, it was agreed to re-survey at intervals of approximately five years. As a result, we now have results of irrigation surveys for 1958, 1964, 1969, 1974, 1979, 1984, and 1989. Much of the data from each of these surveys are included in this report.

Reliable water use data are difficult to obtain. Most of the water that is applied to irrigation is unmetered and normally unrecorded, and the amount of water applied is affected by many variables. The rainfall during the survey year influences the amount of water used and the number of acres irrigated. A wet spell or dry spell during the growing season, and the period of peak crop demand for water will affect to a degree how much water is applied by irrigation to a particular crop. The cropping patterns of an area affect the water demand. Consumptive use of water by crops is dependent upon the characteristics of the crop as related to rooting depth and rates of transpiration.

## 1989 SURVEY PROCEDURES

Survey forms and the field data gathering, recording, and computational procedures were jointly developed by the cooperating agencies. The Soil Conservation Service collected the basic data, using technical support staff to provide statewide leadership and area engineers to provide local leadership. Area conservationists and district conservationists and their staffs at the field office level, thoroughly familiar with irrigation and the land and water resources of their respective areas, did much of the detailed work. The Texas Water Development Board processed the maps and data sheets and compiled and published the report.

County highway maps were used to record much of the survey information. Data recorded on the maps were subsequently used to prepare summary tabulations of irrigation acreage by river and coastal basins and zones, soil and water conservation districts, and counties.

Other data, including irrigated acreage and water use for each irrigated crop type, were recorded on standardized forms on a countywide basis. The amounts of water used countywide were prorated among soil and water conservation districts, and among river and coastal basins and zones according to the proportionate acreage irrigated from a given source of water supply that was located in each area segment.

Accuracy of survey data differs from county-to-county, according to the quantity and accuracy of records available, the degree of familiarity with the area of the assigned personnel, and the amount of field observation that could be made in making the survey. In general, Soil Conservation Service field personnel making the survey considered that their estimates were within a 5 to 10 percent range of accuracy.

## PRESENTATION OF DATA

Summary survey data are contained in Table 1 for counties, in Table 2 for river and coastal basins and zones, and in Table 3 for soil and water conservation districts. These tables each list the total irrigated acreage, the acreage irrigated by each source from which water was obtained, estimated amount of water from each source that was used, and the percentage of the combined supply source of water used that was surface water. Shown also, is the acreage irrigated by sprinkler systems; and Table 1 additionally shows the estimated number of irrigation wells in each county with the wells considered to be operable, but not necessarily used during the given survey year. Table 1 provides data from all seven surveys; Table 2 provides data for 1989 and some data for all years; Table 3 provides data for 1989 only.

A brief discussion of individual columns of Tables 1, 2, and 3 is warranted to prevent misapplication of the data: *All Irrigation* includes the total acreage irrigated and the total acre-feet of water applied on-farm on that acreage, regardless of the amount of double cropping (if any) and regardless of source of water used. Amounts of water applied do not include all transmission losses, but only the amounts of ground water pumped and transmitted to irrigated fields and the amounts of surface water transmitted to fields from farm headgates (on-farm use).

Instructions for making the 1989 Irrigation Survey stressed that the estimated amounts of irrigation water were to reflect the amounts of ground water pumped that were actually transmitted to irrigated fields, and the amounts of surface water that were transmitted to fields from farm headgates (on-farm use). Thus, these amounts (Tables 1, 2, and 3) include all water losses (inefficiencies) of the field irrigation systems, but do not include any losses sustained before conveyed water reached farm headgates. Estimates of initial surface water diversions, will, in most cases, be larger than the survey estimates of on-farm use of surface water.

*Surface-Water Irrigation Only* includes that portion of the acreage and acre-feet of water applied for *All Irrigation* that was supplied from *only* surface-water sources, measured from the farm headgate, not the points of diversion.

*Ground-Water Irrigation Only* includes that portion of the acreage and acre-feet of water applied for *All Irrigation* that was supplied from *only* ground-water sources.

*Irrigation Using Combined Supplies* includes that portion of the acreage of *All Irrigation* where both surface and ground water sources were used on the same acreage or where surface and ground-water supplied irrigation was so intermingled that it was impractical to outline the areas where each was used. The part of the combined supply used that was surface water is shown as a percentage.

*Irrigation Wells* is the estimated total number of operable wells in the applicable area at the time of survey.

*Sprinkler Systems* gives the estimated number of acres irrigated with sprinkler irrigation systems during the survey years.

#### **Crop Data (Table 4)**

Table 4 provides estimated irrigated crop acreages for each county for the State for 1984 and 1989. Irrigated crop acreages sometimes exceed irrigated acreages shown in Table 1 because two or more irrigated crops were grown during the same year on the same surface acre (double cropping). Skip-row planted crop acreages have been converted to equivalent solid-planted acreages. Explanations of the crop designations in Table 4 are given below:

*Cotton* includes all types and varieties, including Egyptian.

*Grain Sorghum, Corn, Rice, Wheat, and Other Grain* includes all types and varieties of each when planted "to be harvested for grain." Acreage is included if it was intended for the crop to mature as grain for harvest, even though it may have been grazed during early growth.

*Forage Crops* includes all crops planted for forage, silage, and greenchop.

*Peanuts, Soybeans, or Other Oil Crops* include acreages of each harvested for nuts, beans, or seed for vegetable oil extraction.

*Citrus, Other Orchard, Vineyard, and Pecans* of both bearing and non-bearing acreages are included in these separate items.

*Vegetables - Shallow Root* includes brussel sprouts, cabbage, cauliflower, celery, lettuce, onions, radishes, spinach, strawberries, sweet corn, and other shallow rooted truck crops.

*Vegetables - Deep Root* includes beans, beets, (except sugar beets), cantaloupes, carrots, chard, cucumbers, eggplant, okra, peas, peppers, pumpkin, squash, sweet potatoes, tomatoes, turnips, watermelons, and other deeper-rooted crops.

*Alfalfa, Other Permanent Hay and Pasture, Sugar Beets, Sugar Cane, and Irish Potatoes* are the remaining specific crop categories.

*All Other Crops* category is included for recording acreage of any irrigated crop not otherwise classified.

#### **Miscellaneous Countywide Data (Table 5)**

Table 5 provides countywide data from the 1989 Survey only. Survey items having significance to the current status of Texas irrigation have been tabulated.

The number of miles of lined ditches and underground pipelines, and acreages served, and the number of on-farm impoundments used for irrigation, and acreages served, are shown as improved conservation measures being used by Texas irrigators.

An irrigated operating unit reflects the acreage under the control of an individual operator as being an operating unit regardless of the number or location of the parcels of land that the producer operated.

The number of acres served by trickle irrigation systems is shown for each county. Trickle irrigation systems can be installed on the soil surface, beneath the soil, or a combination of both.

Table 5 includes the estimated acreage that is equipped for irrigation and that was irrigated previously, but not in 1989. An adequately producing well for ground-water irrigation use, or turnouts and other required facilities for surface water use, were considered minimal facilities to qualify acreage for this item.

#### **Major Irrigation Areas (Table 6)**

In Table 6, the county data in Table 1 are selectively regrouped to show the total acreage irrigated and the total water used in those counties comprising major irrigation areas of the State. The data are presented for the seven survey years - 1958, 1964, 1969, 1974, 1979, 1984, and 1989. Discussion of the trends in the major irrigation areas is given in subsequent portions of the

## RESULTS AND SUMMARY

### General

Irrigation is practiced in many parts of Texas under various climatic conditions. In the arid, far-western part of the State, irrigation supplies almost all of the water used by crops, while in the sub-humid parts of the State, a significant part of the crop water requirement is derived from rainfall in most years. To the east in the humid climatic zone, rainfall is adequate for crop production most years, but crop yields are often assured or increased with irrigation during infrequent, critical dry periods.

Water supply adequate to meet the present and future demands of irrigated agriculture is very important. Irrigation production of food and fiber crops has, to a degree, been accomplished through a partial depletion of our ground-water supplies, a situation calling for judicious use and conservation of remaining supplies.

Texas irrigation increased from 6.7 million acres in 1958 to 7.7 million acres in 1964, to 8.2 million acres in 1969, to 8.6 million acres in 1974, and then decreased to 7.8 million acres in 1979, to 6.7 million acres in 1984, and to 6.1 million acres in 1989 (Figure 1 and Tables 1, 2, and 6). The decrease in acres irrigated in 1989 was due largely to economic conditions. Many acres were not irrigated in 1989 because of higher energy costs, declining well yields, unavailability of labor, and depressed farm prices.

Ground water (only) was used for irrigating about 70 percent of the land irrigated in 1989, 25 percent of the acreage was irrigated from surface-water (only) supplies, and 5 percent from mixed supplies of ground and surface water.

Crop year 1989 was a difficult year to survey because of the rainfall distribution (Figure 2). Much of Northwest Texas went into the spring months with above normal rainfall; rainfall and soil moisture were below average during the last part of the growing season of the 1989 crops. Heavy irrigation water application was needed during the growing season. However, for preplant and early plant development, only small amounts of irrigation was required in much of the area. This was beneficial to the declining ground-water supplies being used for irrigation. In the area south, southwest, and west of San Antonio, dry weather plagued the farmers during the entire growing season. Many irrigation wells were used to capacity all season long. The Brazos River Valley and Gulf Coast Prairie areas were also drier than usual.

Irrigation water use increased from 9.6 million acre-feet in 1958 to 12.5 million in 1964. From 1964, however, water use decreased somewhat despite a large gain in irrigated acreage, and in 1969 was 11.6 million acre-feet, a reduction of 0.9 million acre-feet from 1964. The total water used in 1974 on irrigated crops was 13.1 million acre-feet, a 13 percent increase since 1969 in the total water used. While 1964 was abnormally dry, 1958 and 1969 were relatively wet years (Figure 3). The winter, spring, and early summer months in 1974 were very dry although the annual rainfall was near normal. The total water used in 1979 on irrigated crops was 9.7 million acre-feet, a 26 percent decrease from 1974. The first three months and last three months of 1979 in many areas of the State were fairly dry, with about

---

### Irrigation Water Use

average precipitation the other six months. The total water used in 1984 on irrigated crops was 9.3 million acre-feet, a 5 percent decrease from 1979.

The total water used in 1989 on irrigated crops was 8.8 million acre-feet, a 6 percent decrease from 1984, a reduction of 547,657 acre-feet. Nineteen eighty-nine (1989) was a dry year with near average precipitation the first six months, and very dry the last six months in most areas of the State.

The amount of surface water used on-farm in 1989 on irrigated crops was 2.15 million acre-feet, an increase of only 4 percent from that used in 1984 which was 2.06 million acre-feet. In 1979, 1.85 million acre-feet was used; in 1974, 2.19 million acre-feet; in 1969, 2.35 million acre-feet; in 1964, 1.99 million acre-feet; and in 1958, 2.17 million acre-feet.

Ground-water use decreased in 1989 to 6.19 million acre-feet, which was a decrease of 10 percent from the amount used in 1984. Ground-water use was 6.79 million acre-feet in 1984, 6.92 million acre-feet in 1979, 10.28 million acre-feet in 1974, 8.62 million acre-feet in 1969, 9.99 million acre-feet in 1964, and 6.95 million acre-feet in 1958.

The amount of water use from combined supplies in 1989 was 448,665 acre-feet or 47,861 acre-feet less than in 1984.

Water use per acre irrigated in 1989 statewide was 1.45 acre-feet per acre; it was 1.38 acre-feet per acre in 1984; 1.24 acre-feet per acre in 1979; 1.52 acre-feet per acre in 1974; 1.41 acre-feet per acre in 1969; 1.62 acre-feet per acre in 1964; and 1.43 acre-feet per acre in 1958.

Irrigation wells were about the same in number even though some of the old well casings have deteriorated and wells have been abandoned. There were 100,000 wells in 1989; 100,000 wells in 1984; 95,000 wells in 1979; 90,000 wells in 1974; 83,000 in 1969; 70,000 in 1964; and 55,000 in 1958. Not all of these wells were necessarily used in the survey year referenced, although all were considered operable during that year.

Most irrigators in the State are aware of the critical importance of their water supplies. Since total ground-water use constitutes 71 percent of the on-farm water use for irrigation in the State, the diminution of this resource is a threat to Texas' agricultural economy and will ultimately have an adverse effect on the overall economy of the State and the Nation.

The Ogallala Aquifer, which furnishes most of the water for the High Plains area is a declining ground-water supply. Over 80 percent (3.9 million acres) of the total irrigation in the State is in the High Plains area where water levels are generally declining and saturated aquifer thickness is dwindling.

Many irrigators faced with dwindling water supplies have tried to compensate by using less water per acre - in effect, stretching the water over more acres than the supply will irrigate fully. Though research, however, ways are being found to produce satisfactory levels of crop yields with less water by applying the water at the particular stage of crop growth when the crop can use it most efficiently. Other conservation measures now being practiced are discussed in a later section.

Acreage of irrigated crops decreased in the State in 1989. There were 7.0 million acres in 1958, 8.0 million acres in 1964, 8.3 million acres in 1969, 8.8 million acres in 1974, 8.1 million acres in 1979, 6.9 million acres in 1984, and 6.3 million acres in 1989 (Table 4). The difference in acreage between the acreage irrigated and the irrigated crop acreage results from double cropping - growing two or more corps on the same acre during the survey year. Double cropping was done on 220,000 acres in 1989, which was 67,000 acres more than in 1984.

The following tabulation shows that the irrigated acreage of grain sorghum has trended downward since 1969. Irrigated acreage in pasture, hay, and other feeds as a group trended upward strongly through 1969, but declined by 1989 to only 10 percent of the irrigated acreage. Wheat accounts for 15 percent of the 1989 irrigated acreage.

	1958	1964	1969	1974	1979	1984	1989	<i>Percentages of Total Acreage of Irrigated Crops</i>
Grain Sorghum	31	32	33	28	16	15	13

Total	100	100	100	100	100	100	100	

In examining the data in Table 4, it is noted that cotton is still the leading irrigated crop in 1989. Most irrigated cotton acreage is located in the Southern High Plains. Many acres of grain sorghum have been replaced with cotton and corn. Irrigated cotton acreage has increased in many parts of the State, including the Lower Rio Grande Valley, High Plains, and El Paso areas. Grain sorghum was 21 percent lower in 1989 than in 1984, or 225,000 acres less, but much lower than previous survey levels. Corn had a 4 percent increase in 1989 over 1984, or 29,000 acres more. Wheat decreased 18 percent or 210,481 acres in 1989, compared with 1984, and rice acreage decreased by about 16 percent or 59,833 acres. Cotton, wheat, grain sorghum, and corn are the leading irrigated crops in 1989, in the order listed (see Table 4).

Pecans show a 12 percent increase in 1989 over 1984, or an increase of 6,763 acres. The acreage of this crop is expanding in the El Paso Valley, parts of the Winter Garden-San Antonio area, parts of the South High Plains, parts of the Edwards Plateau, Cross Timbers and in small tracts in many other parts of the State. Trickle irrigation systems are being used in many of the new pecan orchards.

Alfalfa acreage decreased in 1989 by 29,000 acres over 1984.

## Irrigated Crops

Oil crops other than cotton - principally peanuts, soybeans, castorbeans, guar, flaxseed, and sunflowers - accounted for 394,000 acres in 1989. Of this total, peanuts accounted for 149,000 acres and soybeans 196,000 acres. There was 19,000 more acres of peanuts in 1989 than in 1984 and 100,000 more acres of soybeans.

Soybeans were produced with irrigation mostly on the High Plains, either as a regular rotation crop or from late seedlings on land where earlier cotton plantings had been damaged by hail or other causes. In some instances, soybeans were planted following wheat where double cropping is practiced. Some of the dryland soybeans were concentrated in the more humid, eastern part of the State where dryland soybeans work very well in a rice-soybean rotation system.

Irrigated fruits are important to the economy of Texas agriculture. Grapefruit and oranges were grown on only 38,182 irrigated acres in the four Lower Rio Grande Valley counties in 1989. The acreage of citrus was 38,000 acres in 1984; 99,000 acres in 1979; 98,000 acres in 1974; 101,000 acres in 1969; 85,000 acres in 1964; and 69,000 acres in 1958. Peaches and apples are grown both under irrigation and dryland in many parts of the State.

Sugarcane is grown only in the Lower Rio Grande Valley of Texas. About 43,000 acres of sugarcane were irrigated in 1989 in the Valley compared to 35,500 acres in 1984. This is a reappearance of an industry of economic importance to the Valley. Sugarcane was grown in the Valley as early as 1830 when it was processed for local use, and reached a peak around 1913. Adverse markets hastened abandonment of production in the 1920's.

Grapes are a crop that has expanded in acreage in the last few years in the South High Plains and Trans-Pecos area. In 1989, there were 5,138 acres of irrigated vineyards.

---

## Major Irrigation Areas

Figure 8 shows the approximate location of the lands irrigated in the State in 1989 and the kind of water used - ground water or surface water. In preparing Figure 8, the mixed supplies were included with the ground-water or surface-water designations according to their relative predominance. If a mixed supply was 50 percent or more surface water, it is shown as surface water on the map; if less than 50 percent, it is shown as ground water. Figure 7 shows the general outline of the major irrigation areas which are discussed below. As indicated in Table 6, these major irrigation areas account for more than 99 percent of the irrigated land in Texas in 1989.

The High Plains accounts for nearly 3.9 million acres or 65 percent of the total 1989 irrigated acreage in the State, and most of it is irrigated with ground water, mostly from the Ogallala Aquifer. This is a declining water supply of uneven distribution. In some areas, the saturated thickness of the aquifer is less than 50 feet while in other areas it is more than 300 feet. Severe diminution of the water supply occurs in the thin sections, and in some areas in the South High Plains the water is essentially depleted and cropping has been converted to dryland.

The amount of water used on the High Plains in 1989 was 4.6 million acre-feet, which is 53 percent of the water used for irrigation in the State in 1989. This is a decrease of 471,000 acre-feet over 1984 and 628,000 fewer acres were irrigated than in 1984.

The Lower Rio Grande Valley consists of a four-county area - Cameron, Willacy, Hidalgo, and Starr. In 1989, 765,800 acres were irrigated; in 1984, 731,300 acres; in 1979, 789,400 acres; in 1974, 794,000 acres; in 1969, 808,000 acres; in 1964, 819,000 acres; and in 1958, 768,000 acres. Irrigated acreage is fairly stable because of the adjudicated water rights to the use of Rio Grande waters.

The general designation of North-Central Texas in this report includes 26 counties in parts of the Rolling Plains, Reddish Prairies, and Northern Edwards Plateau in which irrigation is concentrated in relatively small, scattered areas (Figures 7 and 8). In this region, 171,000 acres were irrigated in 1989; 173,000 acres in 1984; 230,000 acres in 1979; 257,000 acres in 1974; 245,000 acres in 1969; 227,000 acres in 1964; and 135,000 acres in 1958. Haskell, Knox, Hall, Wilbarger, and Wichita Counties each had more than 12,000 acres of irrigated land in 1989. All other counties had less than 12,000 acres each.

The irrigated land in the Trans-Pecos consists of a number of separated, individual areas in 12 counties. In 1989, 157,000 acres were irrigated and the amount of water used for irrigation was 537,000 acre-feet. The irrigation water contains an undesirable level of soluble salt, so extra water is used before planting to leach the soluble salts below the root zone in the soil.

The Winter Garden-San Antonio area extends from San Antonio west to Brackettville and south to Carrizo Springs, including eight counties as outlined in Figure 7.

The Middle Rio Grande Valley is an area along the Rio Grande between Falcon and Amistad Reservoirs in Maverick, Webb, and Zapata Counties and includes the Maverick Irrigation District area. The water used for irrigation is from the Rio Grande and is delivered by gravity flow.

The general designation of the San Angelo area, in this report, includes 13 counties in parts of the Rolling Plains, Reddish Prairies and Central Edwards Plateau in which irrigation is concentrated in small, scattered areas (Figures 7 and 8). The use of irrigation water in this region is largely dependent upon the amount of rainfall and the availability of ground water of usable quality. Most of the wells are shallow and weak. In this region, 123,000 acres were irrigated in 1989; 123,000 acres in 1984; 122,000 acres in 1979; 97,000 acres in 1974; 78,000 acres in 1969; 63,000 acres in 1964; and 34,000 acres in 1958. Tom Green, Glasscock, and Reagan Counties each had more than 25,000 acres of irrigated land in 1989.

The Gulf Coast Prairie is the rice producing area of Texas, situated in the coastal plain north and east of the Coastal Bend in an area between Victoria and Orange, Texas. In this area, 353,000 acres were irrigated in 1989;

413,000 acres in 1984; 558,000 acres in 1979; 575,000 acres in 1974; 575,000 acres in 1969; 503,000 acres in 1964; and 464,000 acres in 1958.

West Cross Timbers is an area of sandy soils that has supported a scattered growth of hardwoods and tall grasses. It occurs in the North-Central part of the State between the North-Central Prairies and the Grand Prairie (see Figure 7). Peanuts, pecans, and peaches are the major irrigated crops and irrigation became widespread in the peanut area beginning in the late 1960's. There were 82,000 acres were irrigated in 1989; 83,000 acres in 1984; 76,000 acres in 1979; 65,000 acres in 1974; 56,000 acres in 1969; 18,000 acres in 1964; and 14,000 acres in 1958.

The Brazos River Valley is a six-county area along the Brazos River where most of the irrigated land is on the floodplain or terrace soils adjacent to the river. Cotton is usually the principal irrigated crop; however, grain sorghum is replacing cotton on some acreage. The areas irrigated totaled 52,000 acres in 1989; 49,000 acres in 1984; 46,000 acres in 1979; 62,000 acres in 1974; 74,000 acres in 1969; 103,000 acres in 1964; and 7,000 acres in 1958.

---

## Land Resources for Irrigation

The kinds, amounts, and locations of the soils physically suitable for irrigation in Texas have been determined from completed soil surveys, conservation needs inventories, and irrigation surveys. Data from these studies show that about 38 million acres of land in the State are physically suitable for irrigation, although much of this acreage does not have water available for irrigation use. The 38 million acres include the presently irrigated land.

The acreage of land previously irrigated and still equipped for irrigation, but not irrigated in 1989, was obtained during the field survey (Table 5). By definition, this is land having at least an adequately producing well for ground-water use, or minimum turnouts and other facilities of using surface water, or both. Approximately 2.44 million acres were recorded in this category, in addition to the 6.08 million acres irrigated in 1989. All of this acreage is readily available for future irrigation. Much of the previously irrigated land is in the rice-producing area of the Coast Prairie where rice, soybeans, and grass are rotated with 1 or 2 years of rice and 1 or 2 years of soybeans or grass, though only rice would be irrigated, typically. Two counties in the Trans-pecos, Reeves and Pecos, and a few counties in the High Plains account for most of the remaining acreage of land previously irrigated, but not irrigated in 1989.

The number of irrigated operating units in 1989 was 34,898. Based on the acreage irrigated (Table 1) and the number of operating units (Table 5), 174 acres were irrigated per operating unit in 1989, compared with 194 acres per operating unit in 1984, 209 acres per operating unit in 1979, and 213 acres per operating unit in 1974.

Urban development continues to expand onto irrigable land, especially in the Houston-Galveston area, El Paso area, San Antonio area, and in the suburbs of smaller cities. In the Lower Rio Grande Valley, large blocks of formerly irrigated land have been converted to trailer parks.

---

Water application with sprinkler equipment has expanded rapidly as labor has become more expensive and less plentiful and as sprinkler equipment has been improved. Tables 1, 2, and 3 include the acreage of land that has been watered with some kind of sprinkler equipment.

Since 1974, many irrigators have invested in new equipment including side-roll and center-pivot sprinkler systems. In 1989, 2,110,000 acres were irrigated with sprinkler equipment. Sprinkler systems are widely used also in the Cross Timbers and the Winter Garden-San Antonio area where the sandy soils have gently sloping and uneven surfaces. Statewide, 2,140,000 acres were irrigated with sprinkler systems in 1984; 2,197,000 acres in 1979; 1,854,000 acres in 1974; 1,548,000 acres in 1969; 1,077,000 acres in 1964; and 668,000 acres in 1958.

---

A somewhat recent approach to irrigation is called trickle or drip irrigation. Its use in American irrigated agriculture is largely restricted at present to perennial crops.

Essentially, trickle irrigation spot irrigates crops - mostly citrus, pecans, grapes, and fruit orchards currently - by applying water only to the base of each plant. The system utilizes plastic tubes that have emitters located near each plant and the emitters are designed to provide the amount of water needed for maximum plant growth.

Water is saved with this method because the total soil area is not wetted, as with sprinkler or flood irrigation. Trickle irrigation applies smaller amounts of water than conventional methods, and runoff water is nearly eliminated.

Other advantages include labor savings, increased plant vigor and yields, use of low-volume wells, and better adaptation to sandy soils. Fertilizers can be applied in the irrigation water.

Some of the researchers caution that there are problems associated with trickle irrigation. The development in Israel took place on deep, very sandy soils that take water rapidly and where the soil-water-plant relationships are quite different than on most Texas irrigated soils. Emitters will clog if the irrigation water is not properly filtered, there are problems in controlling emitter output, and rodent damage may be a problem in some areas. Installation costs are high, also.

The 1989 irrigation survey shows that 40,900 acres in Texas were being irrigated with trickle systems compared to 29,900 acres in 1984 and 19,800 acres in 1979 and 4,000 acres in 1974. This is an increase of almost 37 percent in 5 years, or 11,000 acres. Leading crops were pecans, on 26,750 acres and grapes, 4,500 acres. Other crops irrigated with trickle system and the acreage of each in 1989 are as follows: citrus, 3,575 acres; orchards, 1,930 acres; vegetables, 1,885 acres; nursery and windbreaks, 1,130 acres; blueberries, 420 acres; and other crops, 1,710 acres.

## Conservation Measures

Declining ground-water supplies, rising costs of pumping, and limited supplies of surface water are requiring that irrigation water-use efficiency be increased to the fullest extent feasible. The purposes of agricultural water conservation are to allow existing, but exhaustible, ground-water reserves to support present irrigated acreages for longer periods of time, to reduce the costs of production, and, to the extent possible, allow for an increase in irrigated agriculture to meet growing market demands for food and fiber in future decades.

Significant savings in water use can be accomplished with improvements in conveyance systems, the use of more efficient irrigation application systems, soil moisture monitoring, the development and use of drought-tolerant strains and varieties of crops, and the use of growth regulators and evaporation suppressants. Along with use of water-saving equipment and practices to reduce the quantities of irrigation water applied to crops, appropriate farming practices need to be developed and used to capture and hold rainfall in the soil profile. The capture and retention in the soil profile of rainfall, or reducing runoff from fields, applies beneficially to dryland farming operations as well as to irrigation operations. Furrow diking and conservation tillage are the leading practices currently in use to reduce rainwater runoff, along with control of weeds and brush that use water for no beneficial purposes. In order to realize these potentials, public and private agencies, institutions, and establishments need to expand water conservation research and extension programs.

Public agencies' role in agricultural water conservation should be to promote conservation and disseminate information and materials on irrigation techniques and equipment that are water efficient. Agricultural water conservation work will be done to the extent that resources are available for programs of public information, training, assistance, and demonstrations to local-area soil and water conservation districts, underground water conservation districts, farmers, and through cooperation and support of all federal, state, and local agencies with related responsibilities. It is in the private sector, however, that most of the actual investment, production, financing, and finally purchase and use of irrigation water conservation equipment must be made.

The declining ground and surface-water supplies available for irrigation have convinced many people of the need for water conservation and good water management. In a properly planned and well-managed irrigation system, all necessary equipment and control structures are installed, the quantity of water used for each irrigation is determined by the need of the crop (especially the stage of growth), and the water-holding capacity of the soil is determined. Water then is applied at a rate and in such a manner that the crops are able to use it efficiently and significant soil erosion does not occur.

The system design should make efficient use of irrigation water applied and rainfall. When planning the system, the peak use rates and seasonal and monthly demands of each crop must be considered in determining the irrigation water requirements. Research and experience have been the basis for using soil moisture balance studies to calculate irrigation water

requirements. Research in recent times has provided data on when to irrigate and how much water to apply for maximum efficiency in irrigation water application. Following these findings produces maximum yields per inch of water applied or acceptable yields with much less water, acceptable meaning a yield from irrigating that has a positive net economic benefit.

Additional activity has been in the area of assisting irrigators to evaluate the efficiency of their irrigation systems. The High Plains Underground Water Conservation District No. 1, other underground water conservation districts, the U.S.D.A. Soil Conservation Service (SCS), and local soil and water conservation districts, with assistance from the Texas Water Development Board, have established an efficiency testing program using mobile units call Field Water Conservation Laboratories. These units contain various types of measuring instruments to test irrigation systems efficiency. Based on test results, SCS or Texas Water Development Board personnel provide recommendations to improve the irrigation systems. This helps the irrigator use water more efficiently (less waste) and also cut down on his fuel cost.

Many irrigators are installing water-saving conveyance measures which have been accounted for in the irrigation surveys. The data for 1989 show 1,199 miles of concrete-lined ditches serving 155,000 acres of irrigated land and 22,000 miles of underground pipelines serving 4.8 million acres of irrigated land. Eighty-two percent of 1989 irrigated land was supplied with these kinds of water conserving facilities. Most of these facilities are in the Lower Rio Grande Valley, Winter Garden-San Antonio area, and the High Plains.

Storage reservoirs are being built in water-short areas to hold water being pumped from weak wells in order to have sufficient water when needed for irrigation. In some areas playa lakes are being modified to concentrate the water in deep pools. This reduces the area exposed to surface evaporation and provides the maximum amount of water available for irrigation. Some systems are modified to pump back the runoff from row-irrigated land (tailwater) and thus conserve water through reuse. Some producers, as well as researchers, are using recharge wells to put playa lake water into the Ogallala Aquifer.

There were 512 on-farm water impoundments, exclusive of playa lakes, serving 50,000 acres of irrigated land in 1989. These impoundments of surface-water supplies enable the irrigator to utilize the water when it is needed.

Furrow diking is a method of mechanically mounding soil in furrows at selected intervals perpendicular to the farming direction, forming a series of micro dams and water-impounding basins. An important and primary method of improving rainfall effectiveness in crop production is to increase infiltration of rainfall on cropland, thereby storing moisture in the soil for use by plants. Furrow diking is an excellent way to accomplish this without extra modification or additional trips through the fields. This practice applies beneficially to both irrigated and dryland farming.

Several new methods of irrigating have developed or implemented in the last ten years. Texas has the honor of being partly, in one case, and almost fully in another, the principal in two of these methods, surge flow and LEPA systems.

---

## Surge Flow Irrigation

Surge flow irrigation is an innovative method of furrow (and basin) irrigation that capitalizes on a natural, soil physical phenomenon. It entails irrigation with two sets of gated pipe, switching water back and forth between these sets. This shunting of water is done with a valve located at a "T" or "Y". The valve is controlled by a timer, such that one set of gated pipe is discharging the furrow streams while the other remains closed. At the predetermined interval, the valve opens to allow water down the previously dry side and closes access to the gated pipe which had just had water. At the appropriate time, the switch is made again. Typical interval times range from 15 minutes to one hour.

During the off period of the cycle, the water that was in the furrow infiltrates into the soil. This infiltration action creates a surface sealing effect that reduces subsequent infiltration. This infiltration rate reduction helps to lower deep percolation loss at the top of fields.

Apart from its enhancement of furrow irrigation performance because of the surge-flow effect, these valves are leading toward automation of furrow watering. Valves may also be used to establish cut-back irrigation (large furrow streams are used to get the water to the bottom of fields quickly, then cut back to avoid runoff) by simply opening both sides of the valve, reducing furrow streams by 50 percent. This method of irrigation is well recognized as being highly efficient.

---

## LEPA Systems

The Low Energy Precision Application (LEPA) system involves a center pivot sprinkler (although it can be used on a linear move) that has been nozzled for low-energy application. Water is discharged at low pressure right into furrows, which run in concentric circles. The furrows are also furrow diked. The idea behind the system is to eliminate as much evaporation loss as possible. In essence, it has some of the attributes of center pivot, furrow, and trickle irrigation. The furrow dikes keep the water in place and prevent uniformity imbalances arising from water running off higher elevations into lower areas. Application efficiency of 98 percent is possible. This high efficiency (conventional center pivots average only 77 percent) is also coupled with less energy use when compared with the traditional center pivot.

Table 1.— Irrigation Summary for Counties—1958, 1964, 1969, 1974, 1979, 1984, 1989

County	Year	All Irrigation (On-Farm Use)		Surface Water Supplied (On-Farm Use)		Ground Water Supplied (On-Farm Use)		Irrigation Using Combined Supplies (On-Farm Use)		Surface Source Percent	Irrigation Sprinkler Wells	Sprinkler Systems

## SOIL AND WATER CONSERVATION DISTRICTS IN TEXAS

<b>Districts in State Zone One</b>		<b>Districts in State Zone Three</b>		<b>District in State Zone Five</b>	
104	Floyd County	228	Maverick	408	Bowie County
107	Rio Blanco	229	Bandera	412	Harrison County
108	Lubbock County	230	High Point	415	Lamar
109	Hall-Childress	231	Trans-Pecos	417	Upshur-Gregg
110	Tule Creek	232	Runnels	419	Sulphur-Cypress
111	Blackwater Valley	233	Llano County	421	Anderson-Houston
115	Upper Colorado	234	Middle Concho	422	Trinity-Neches
119	Lynn County	235	Crockett	423	Red River County
124	Dawson County	236	West Nueces-Las Moras	424	Freestone-Leon
125	Gray County	237	Rio Grande-Pecos River	425	Montgomery-Walker
126	Cap Rock	238	Upper Nueces-Frio	426	Smith County
127	Donley County	240	Chaparal	427	Cherokee County
129	Hockley County	241	Sandhills	428	Bedias Creek
130	Lamb County	242	Mustang	429	Piney Woods
131	Dallam	243	Howard	432	Coastal
132	Hale County	244	Midland	433	Marion-Cass
133	Salt Fork	245	Nolan County	434	Trinity Bay
134	Lipscomb	246	Andrews	435	Lower Trinity
136	Running Water	247	Eldorado-Divide	436	Polk-San Jacinto
137	Moore County	248	Tom Green	437	Lower Neches
138	Hemphill	249	McCulloch	438	Upper Neches
140	Parmer	250	San Saba	439	Long Leaf
141	Wheeler County	<b>Districts in State Zone Three</b>		440	Navasota
142	Ochiltree	301	Wilson County	441	Jasper-Newton
143	Tierra Blanca	304	Caldwell-Travis	442	Harris
145	Roberts	306	Comal-Guadalupe	443	Delta
146	Hutchinson	307	Atascosa County	444	Wood
147	Palo Duro	311	Nueces-Jim Wells-Kleberg-Kennedy	445	Hopkins-Rains
148	Hansford	313	Burleson-Lee	446	Lower Sabine-Neches
149	Cochran	316	Matagorda County	447	Rusk
150	Yoakum	317	Coastal Plains	448	Panola
151	Terry	318	Waters Davis	449	Shelby
152	Hartley	319	Southmost	450	Brazos County
153	Oldham County	320	Dimmit County	451	Robertson County
155	Staked Plains	312	Aqua Poquita	<b>District in State Zone Five</b>	
156	McClellan Creek	323	Live Oak	501	Limestone-Falls
158	Garza	324	San Patricio	504	Ellis-Prairie
159	Sherman County	325	Frio	505	Kaufman-Van Zandt
160	Canadian River	326	Winter Graden	506	Hamilton-Coryell
161	Foard County	328	Loma Blanca	508	Little River-San Gabriel
162	Lower Pease River	329	Copano Bay	509	Central Texas
163	Cottle	330	Alamo	512	McLennan County
164	Upper Pease	331	Monte Mucho	513	Taylor
165	Upper Clear Fork	332	Starr County	514	Navarro
166	Gaines County	333	Colorado	518	Palo Pinto
167	Stonewall	334	Lavaca	519	Dalworth
168	King	335	Zapata	520	Fannin County
169	Duck Creek	336	Jackson	522	Bosque
170	Andrew Kent	337	Webb	524	Upper Elm-Red
<b>Districts in State Zone Two</b>		338	Gonzales County	525	Upper Leon
201	Concho	339	DeWitt County	529	Hood-Parker
205	El Paso-Hudspeth	340	Bastrop County	530	Upper Sabine
206	Middle Clear Fork	341	Fayette	532	Little Wichita
207	Mitchell	342	Wharton County	534	Hill Country
208	North Concho River	343	Karnes County	535	Collin County
209	Toyah-Limpia	344	Bee	537	Wilbarger
210	Highland	345	Calhoun	538	Wichita
213	Upper Pecos	346	Victoria	539	Young
215	Menard County	347	Austin County	540	Hill County-Blackland
216	Kendall	348	Washington	541	Johnson County
217	Kerr County	349	Willacy	542	Miller-Brazos
218	Pedernales	350	Hidalgo	543	Throckmorton
219	Coke County	351	Hays County	544	Wichita-Brazos
220	Gillespie County	352	Goliad County	545	California Creek
221	Nueces-Frio-Sabinal	353	McMullen County	546	Haskell
222	Edwards Plateau	354	LaSalle County	547	Denton County
223	Mason County	<b>Districts in State Zone Four</b>		548	Wise
224	Devil's River	401	Nacogdoches	549	Jack
225	Upper Llanos	404	Davy Crockett-Trinity	550	Central Colorado
226	Medina Valley			551	Lower Clear Fork of the Brazos
227	Big Bend			552	Callahan Divide
				553	Pecan Bayou
				554	Mills County
